Iowa Dairymen's Convention.

Impressions of a Man on the Spot.

ED. HOARD'S DAIRYMAN:—Traveling over the Illinois Central Railroad from Dubuque west to Waterloo, I began to get impressions of Iowa as a dairy state before I was very far out in the country. My first impression was that the dairymen of the section I was passing through did not realize the value of the corn stalk either in the shock or silo. On every hand I saw fields of husked corn, the stalks left to menace the lives of the animals that were forced to subsist on them; the only silos seen on the trip were at Masonville. My next impression was that the dairymen of Iowa were much like those of my own state in regard to sunshine; their barns were constructed to keep it out instead of having plenty of windows to let it in, as they should. What windows there were, were used for getting the manure out of the stables, more than for letting in light.

Just about the time I had arrived at this conclusion, my eyes discovered a familiar face in the rear of my car, no less person than our genial President of the Dairymen's association of this state, Mr. Jos. Newman. He was in company with the Secretary of the Buttermakers Association of Wisconsin, and we spent the balance of the trip to Waterloo talking shop.

On reaching the hotel that was the head quarters of the boys, we were greeted by old friends in numbers. Sudendorf, as large as his 5 ft. 8 would admit of, was one of the first to greet us; then Wentworth of Marshalltown, Dairy Commissioner Wright of Des Moines, the grand old singer, Jules Lombard of Omaha, and so many more I will not take up space to name them, extended us the glad hand.

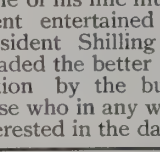
We had just time before dinner to visit the machinery hall, and there saw the most complete display of all of the necessary creamery and dairy adjuncts that we ever saw at a dairy meeting. The booths were tastefully decorated and the machinery and goods so placed that as a whole the effect was very pleasing, and by the crowded condition of the room was appreciated by the visitors.

The butter room looked like a South Water street commission house cellar as much as a display of prize competing lots of butter; 137 packages were entered and the scores were quite high on the average. W. S. Smarzo of Masonville, took first with a score of 98 (I would like to know if this butter was from cows fed from one of the silos I saw near that town); the second prize went to J. E. Scott of Dubuque. I did not get a list of balance of scores, but was told that the total average would be high.

The cash premiums were very liberal, and the amount to be pro-rated among the exhibitors scoring above 91 was $610.00.

The report of the State Dairy Commissioner was a good document and illustrated how much the dairy interests of Iowa mean to the state. The list of active creameries in the state number 792 and they made a total of 65,000,000 lbs. of butter in the past year. The hand separator has gained ground very fast in the state during the past year, an increase of 100 per cent over the previous year, and Mr. Wright estimates that of the total make of the creameries fully 15,000,000 lbs. were from the hand separator cream. This is a step in the right direction. It means several things to the dairyman who separates his milk at home. Less hauling, less time spent at the creamery delivering the goods and receiving back the skim milk, and not the least advantage is the fact of having the skim milk fresh, warm and sweet at home. There are 38 creameries in the state that are exclusive hand separator cream creameries and two-thirds of all other creameries receive such cream.

In the whole state, with its numerous cities of large size, the fact that with the oleomargarine people wishing to do so much for the poor, there were but six licenses issued from January 1st, up to October 1st, tells its own story.

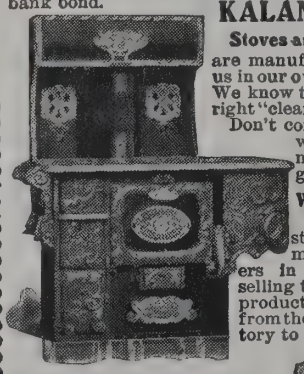


The program offered to the dairymen was a good one and many valuable ideas were presented. The Governor gave a talk that was intended to create a state pride in those present, and by the way it was received the object sought was accomplished. He made the statement that as a state, it had the least amount of waste land within its borders of any state in the Union, about 2½ per cent he thought, and as a dairy state it ranked at at the top.

The President of the Association, Mr. S. B. Shilling spoke of the past meetings and classed the present one as the best ever held, barring the one at Dubuque two years ago, and as to the dairy exhibit, it excelled anything in Iowa's history. He made the statement that the dairymen of the state had not as yet reached one-half of the possibilities of their cows, and substantiated his statement with figures from the Station reports. In this I can heartily agree with him. Not only is this true of Iowa, but of Illinois as well and all other dairy states that I am familiar with. Not only can we double our product per cow, but at the same time not increase the cost per head in feeds, a better knowledge of feeds and feeding, environments better suited to the cow's comfort and the greatest of all, systematic weeding and breeding.

Prof. Kennedy of the Iowa Station was a speaker that got a close hearing, his subject was how to know the dairy cow when you see her, and after you see her, how to feed her. He pointed out the necessity of feeding a balanced ration to a well defined, dairy formed cow, and showed the necesssity of buying the protein foods to balance the farm grown crops. This part of his talk was especially good, for it was practically what I had intended to say myself in the paper I had prepared. After his talk, I was on one leg, so to speak, as far as my prepared paper went, but I consoled myself with the fact that he left me the other half.

The next speaker was a Minnesota dairyman, a Mr. A. W. Mowbray, who is the President of the Minnesota Dairymen's Association. His theme was the silo for the Iowa dairyman, and, Oh, base ingratitude! I loaned him my model silo to illustrate his talk with and assisted him in other ways to present the most important subject of the meeting, and what did he do, but take up the half of my paper Prof. Kennedy had left, and away went my other leg, leaving me, figuratively speaking floundering, on the rostrum 190 miles from home.



The evening session of the 19th was devoted to the National Buttermakers' Association. Jules Lombard gave us some of his fine music, and other musical talent entertained us for a time, then President Shilling in an earnest talk, pleaded the better support of the Association by the butter makers and all those who in any way were connected or interested in the dairy industry. He gave

All Kalamazoo ranges and cook stoves are equipped with patent oven thermometer. Makes baking sure and easy.

Oil Cure For Cancer.

The Dr. D. M. Bye Co., of Indianapolis, Ind., report the discovery of a combination of soothing and balmy oils which readily cure all forms of cancer and tumor. They have cured many very bad cases without pain or disfigurement. Their new books with full report sent free to the afflicted

reasons, a plenty, why the organization should be continued and built up; the organization being a fighting one it required funds to buy the munitions of war and the funds must come from interested parties. He cited the great work it had done in the oleo legislation, and pointed to the fact that the law now on the statute books must be kept there by a constant watch on the opposition, who are in every way trying to evade the law and create enough prejudice to get a repeal or modification.

Secretary Knight presented his report and among the things he said was that the unrestricted sale of oleo would cause the bats to roost in every creamery in the State of Iowa, while 1,000 buttermakers and as many assistants would be forced to seek other work. He spoke at length on the value of the law to the dairy interests, citing the price of butter for the past year as being 1½ cents higher than previous year. Speaking for himself, he said he was ready to give up the secretaryship to some one else, he was discouraged with the fight, not in the work accomplished, but in the lack of funds, and the hard work required to collect them; people did not realize the work required, and the amount of money it took to carry on the work, or they would be more free in the contributions. He paid a glowing tribute to ex-Governor Hoard and deplored the fact of his resigning from the organization's presidency.

The election of officers for the year resulted in retaining the entire list as follows: S. B. Shilling, Mason City, President; W. B. Barney, Hampton, Vice-President; P. H. Rieffer, Manchester, Secretary; F. A. Leighton, New Hampton, Treasurer.

Taken as a whole the 27th Session of the Dairymen's Association was, as President Shilling told us, the best in its history, and will result in much good,

VETERINARY.

Queries in this department answered by DR. A. H. HAETWIG, Watertown, Wis.

Injured Teats.

I have a cow that has a teat with the point stepped off, some time ago. I used a milk tube for drawing this milk, but dried up on that quarter, and on account of the pain I didn't bother her and now find that the hole is grown up. She comes in in 10 weeks. Also have a cow that has an obstruction way up in her hind quarter, I can push a milk tube, 3 inches long, up and strike it, and then comes blood, with milk for awhile, but dries up in a short time. If I have to use an instrument, what's the name, price and where can I buy it?

Dows Prairie, Cal. A. F.

ANSWER.

The only remedy in both of your cases, is the teat bistoury. In the former case, where the teat is practically closed up, it is best to wait until she comes fresh, then insert the bistoury and make your incision in four opposite directions. The flow of milk will keep a free opening and render the cure permanent. In the latter case you may use the bistoury at any time to lay open the obstruction and allow the milk to come down. A teat bistoury can be obtained from this office for $1.50 postpaid.

Infectious Abortion.

What is the best treatment for a herd of 30 cows that have abortion. I have three that have lost their calves within the last three months. Our local veterinary pronounced it abortion, but did not examine and prescribed carbolic acid. I have fed for two weeks and I believe it is drying them up. They have failed from 7 cans a day to 3½ cans. I feed 1½ ounces acid to 29 cows.

Wenas Wash. J. F. C.

ANSWER.

If your cows have infectious abortion your case requires more than ordinary precaution and strict adherence to the following directions. It is not an easy task to prevent the trouble from going through the entire herd when it is once started. Experience has taught us that carbolic acid has no favorable affect whatever when given per mouth, or even if injected hypodermically; a cow that will not abort after feeding carbolic acid, would not have aborted if it had been omitted entirely. To treat abortion successfully we must apply our antiseptic agents directly to the seat of the trouble, which is in the reproductive organs.

We must, first of all, isolate the cows which have aborted; destroy the afterbirth and foetus, and thoroughly disinfect the stables in which they have aborted; whitewash the walls and give plenty of light in the stables. About the best agent to apply to the floor is air-slaked lime. Apply it once daily after cleansing. In the absence of lime, wood ashes or land plaster may be used instead. If in the grass season it is advantageous to put the healthy cows to pasture. The cows which have aborted should not be allowed to retain the afterbirth; the same should be promptly and completely removed, and the uterus and vagina thoroughly cleansed by irrigating same with a 1-5000 solution of bichloride of mercury, or other disinfecting agents. This can best be done by using a large sized fountain syringe, and should be repeated once daily, until the disappearance of the vaginal discharge. Until this has entirely disappeared no cow should be used for breeding purpose, or be allowed to be returned into the herd among the healthy cows. We may also increase the power of resistance of all the animals by means of food rich in nitrogen, and a teaspoonful or two of powdered cramp bark in food, once daily.

Mastitis.

A year ago last August, I had a cow taken with the cow pox, and being the first case I ever saw, did not know what it was, letting it run on until her teats became quite sore before I got it healed up with iodine and vaseline ointment. About this time she had a calf and her bag caked considerable; both back quarters were badly caked and whole udder very hot. Another question, I have another cow, rather old, a very quiet disposition, and I have never yet been able to detect when she came in heat. Is there any treatment that I can give her that will bring her in heat in a short time? B. F. C.

Keokuk, Iowa.

ANSWER.

1. Your cow had a case of mastitis, and your external treatment could not be improved, but you might give two tablespoonfuls of sulphate of soda in food, twice daily, which will act as an alterative.

2. Increase your grain ration and give a teaspoonful of powdered nux vomica in food once or twice daily.

Enlarged Knee.

We have a five-year-old mare with a soft bunch on her knee, just below the knee pan, about as large as a small hen's egg. It has been there several months. Was never hurt to our knowledge. Bunch seems to increase very slowly.

Clifford, Pa. L. W. A.

ANSWER.

Clip off the hair over the enlargement and apply the following over same once daily, rubbing it well for 10 or 15 minutes each application and continue this for four days. After this let it alone; do not wash off:

Iodine resublimed, 2 ozs.; potassi iodi, 1 oz.; petrolatum, 8 ozs.

This will absorb almost any enlargement except bone. If not reduced satisfactorily, repeat in two weeks.

"SAVE-THE-HORSE"

Registered Trade Mark

SPAVIN CURE

To The Troy Chemical Co
Troy N Y.

Dear Sir Please send me one more bottle of "Save the horse" It is doing great work.

Respectfully
Millard F. Sanders
7 Spring Park Glenville O.

September 7, at the Fasig-Tipton sale at Sheepshead Bay, a yearling by Esher-Excellenza was being sold by Mr. William Easton, and when the animal was led into the ring he said:—"This horse has been suffering from a bog spavin, of which practically no trace remains. He was treated with that remedy called 'Save-the-Horse,' which all of you know, and it did save the horse; that is, it cured him. Now, you know lots of great horses, Morello and others, were successfully raced, and there is no reason to expect that this colt will ever take a hame step." The bidding opened then at $250, and the colt was sold for $300 to Mr. J. D. Smith.

"Private Stables Jas. Galway, Race Track, Saratoga, N. Y.

I got a bottle of "Save-the-Horse" first of Moseman & Bro. of New York and used same on ringbone, curing it entirely. I next used 'Save-the-Horse' on two splints and cured them. Have also used it on a strained Pastern Joint, which made horse very lame; it cured this also. I predict a great output of 'Save-the-Horse.' It has never failed to cure any case I used it on." EDWARD FEAKS, Trainer for Jas. Galway, of 312 West 56th St., New York, the millionaire owner of Meltonian and many other noted horses.

Cured horses are absolute certainties as to the possibility of the remedy for your own case. Such results as above by men whose reliability can be readily ascertained, have carried "SAVE-THE-HORSE" over skepticism, prejudice and uncertainty. Send for booklet and copy of written guarantee, which is as binding to protect you as the best legal talent could make it. No man need see his horse suffer and become incapacitated.

"SAVE-THE-HORSE" Positively and Permanently Cures BONE and BOG SPAVIN, THOROUGHPIN, RINGBONE, (except low ringbone,) CURB, SPLINT, CAPPED HOCK, WINDPUFF, SHOE BOIL, WEAK and SPRAINED TENDONS and ALL LAMENESS. Cures without scar, blemish or loss of hair. Contains no mertury or peisonous substances. Can apply in all conditions and extremes of weather. Horses may be worked as usual.

$5.00 per bottle. Written guarantee with every bottle given under seal and signature, constructed solely to satisfy and protect you fully. Need of second bottle improbable, except in rarest cases.

$5.00 per bottle at all druggists' and dealers', or sent express prepaid.

Stable Queries—Disposal of Liquid Manure—Hay Slings.

I expect to fix over an old barn next spring, and I would like advice on some points. I intend to put my cows, young stock and pigs in the basement, which will be cemented.

What is best plan for saving liquid manure, by absorbents, or draining into cement cistern to be removed by a pump, or otherwise? If by cistern, how can one be made in land where the water table ordinarily stands about two feet below the surface?

Have you any experience with hay slings?

What size doors would be required to operate them if the hay is to be put in from outside the barn?

Can you suggest any books which would help me in planning the changes? SUBSCRIBER.

Southampton, Mass.

We do not know of any single book which treats upon all the topics named.

Our own practice and preference is to dispose of the liquid manure by use of absorbents. In this way we get a better distribution of the fertilizing ingredients for our purposes, but it may be easily seen that special conditions would be better served by using the liquids by themselves, especially on grass lands. However, it would be a somewhat difficult matter to construct a durable cistern in ground where the ordinary water level is so near the surface.

We have used hay slings, but our old-fashioned barns do not lend themselves to their use so acceptably as to the common horse fork. The opening for using slings will need to be not less wide than the breadth of the load and fully as high.

A Virginia Dairy Ration—Saccharine Dairy Feed.

Please formulate a ration for my herd of registered Holsteins and grades recently fresh. I have plenty of good corn ensilage and stover. Mill feed and wheat bran cost me $24 per ton; cotton seed meal, $28, and linseed meal, $34. I can also get cotton seed for 20 cents a bushel, also saccharine, concerning which I enclose a pamphlet, $24 a ton. Would you suggest anything more? SUBSCRIBER.

Crewe, Va.

The Saccharine dairy feed mentioned is represented to consist of 30 parts ground corn and oats, 20 parts cotton seed meal, 20 parts distillers dried grains, 26 parts corn molasses and 4 parts salt, all by weight, and to have a guaranteed analysis of 15 per cent protein, 55 per cent carbohydrates and 5 per cent fat. This comprises the total contents, and makes the feed correspond very closely to common bran in digestible nutrients. It is admitted that cows sometimes do not take to it very kindly at first, but soon come to relish it highly. The formula for its preparation would indicate it to be unobjectionable, except for the use of more salt than we have been accustomed to recommend. It is reported to have been in use at Biltimore Farms a year ago and was giving satisfaction. It would seem, therefore, that our inquirer would be justified in making a trial of it in connection at first with more or less bran; but if this feed is what it is represented to be, there can be no necessity for feeding it in such amount as is recommended in the pamphlet sent us.

From the other feeds named we should expect good results from, say, 35 lbs. silage, 10 lbs., more or less as the cows would eat without waste, corn stover, 5 lbs. bran and 2 lbs. cotton seed meal. We practice giving the meal, whatever it may be, in connection with the silage, and adding a good teaspoonful of salt to each mess.

Scotch Bred Ayrshires.

I am interested in Scotch Bred Ayrshire cattle, and would like your opinion on this breed of cattle. I have four heifers that will not milk until June, F. C. W.

Conneaut, Ohio.

There has been more or less of fadism in the breeding of Ayrshires in Scotland for some years. The old, dairy-type Ayrshires became unpopular at shows, and to win prizes, breeders had to sacrifice dairy points, and breed and feed for the round, smooth and fat beef outlines. A large udder and good sized teats were accounted blemishes. Not all Ayrshire breeders in Scotland,—perhaps but a comparatively few of them—adopted these heresies, but if they did not they kept their cattle at home, and, by following better methods of breeding and feeding have maintained, in considerable degree, the former prestige of the Ayrshires as a dairy breed. In this country, the dominant Ayrshire sentiment is to hold fast to dairy lines of breeding and feeding, and the result is that Ayrshires are again coming to the front as dairy cattle.

For Increasing the Butter Fat.

I have read your answer to my inquiries and in answer will write that I am feeding the cows now on orchard grass, cut early, and there is some timothy hay mixed in with it, and for a grain ration I am giving ground oats and corn, 3 parts oats, 1 corn, and a feed of beets.

What I would like to know is, if by feeding some kind of oil meal can I increase the butter fat? G. P. C.

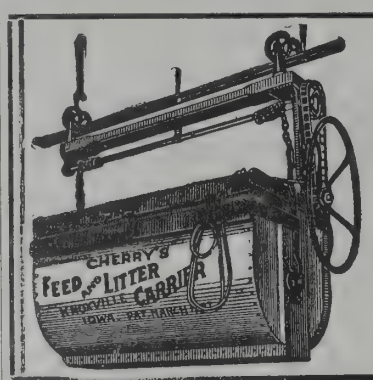
The per cent of fat in milk cannot be materially and permanently increased by any change of feed. Probably 2 lbs. of oil meal daily would bring up the per cent of fat for a few days, but it would very soon fall back to the normal proportion the individuality of each cow determines. The only way to increase the amount of butter fat is to increase the yield of milk by generous and proper feeding. In this case, it is our opinion that a little oil meal added to the daily ration would probably increase the flow of milk somewhat, and more important than that, tend to prevent undue shrinkage. The amount to feed, must be governed entirely by circumstances and results. Commence with not more than a half-pound per day, and increase from time to time if the results warrant.

For Kansas Holsteins—Warming Water for Cows.

Will you kindly give me the daily amount of bran and oil meal required for Holstein cows producing four gallons per day, with all the clover hay they will clean up.

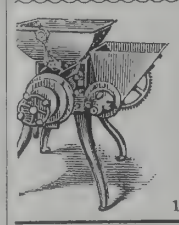
Is cotton seed meal, at the same price, better feed than oil meal?

What do you think about warming water for cows in winter; opinions seem to differ on this subject?

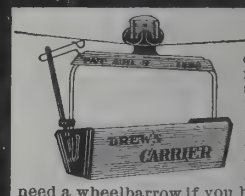


Merriam, Kansas. H. M.

We recommend trying 4 lbs. bran, 2 lbs. oil meal and 2 lbs. ground corn in connection with clover hay *ad libitum*. We add the ground corn to bring up the carbohydrates somewhat, and if the cows appeared to respond would not hesitate to increase the amount specified. Under the conditions named we should prefer the linseed oil meal, but if there was silage or roots, we should have but little choice.



If the water is in an outside tank, where more or less ice forms at times, we unhesitatingly advise the use of a tank heater for warming the water, but if the tank is in the barn where the temperature of the water does not fall much below 50 degrees, we should not consider warming water particularly necessary. In other words, water for cows should be at about the temperature most healthful for men.



.22 CALIBER RIM FIRE CARTRIDGES.
Winchester .22 Caliber Cartridges shoot when you want them to and where you point your gun. Buy the time-tried Winchester make, having the trade-mark "H" stamped on the head. They cost only a few cents more a box than the unreliable kind, but they are dollars better.

LET US POINT OUT A GOOD FENCE

If you are going to buy any fencing this season, it is important that you buy the best fence on the market, and that you buy it at the Right Price. WE POINT OUT OUR
Advance Fencing
as being the best made fence on the American market. It has a continuous stay wire which is woven into the top and bottom strands from one stay to the next without leaving any loose ends. The stay wire cannot slip or slide on the horizontal strands. We have a Free Fence Book, which tells all about our twenty-three different styles of ADVANCE FENCING, a fence for every need on the farm. This book also tells how we sell our ADVANCE FENCING direct to the farmer, giving him the advantage of the dealer's and jobber's profits. It also tells how we sell Advance Fencing on 30 Days' Free Trial which gives you ample opportunity to be absolutely satisfied that you are getting just what you want. We Pay the Freight. This enables you to know just what the fencing is going to cost laid down at your railroad station. It is the fairest fence offer ever made by anyone anywhere. Send for our FREE FENCE BOOK and find out all about ADVANCE FENCING and our liberal offer before purchasing. Write for it at once. DO IT NOW.

ADVANCE FENCE COMPANY, - 33 H Street, Peoria, Illinois.

Three Highest Scores of the National Educational Butter Tests.

ED. HOARD'S DAIRYMAN:—Enclosed I take pleasure in handing you report of the high scores of the second National Educational tests, which were conducted by the National Creamery Buttermakers' Association with the aid of the United States Department of Agriculture.

COLONIAL BUTTER SALT

(Light, Flaky Grain)

LIBERTY BUTTER SALT

(Granulated, Uniform Grain)

"Money Makers for Butter Makers"

FLAVOR—PERFECT
COLOR—PURE WHITE

Purity—very highest, over 99 per cent pure salt.

Driest and Lightest Salts on Earth, thus retaining the moisture in the butter that would otherwise be worked out.

You don't know—you CAN'T know—what a difference these salts will make in the quality, weight, and value of your butter until you have tried them. Don't care what other salt you think is best you must try our brand before you find perfection.

FREE TRIAL. Write us for free 56 lb. trial sack of either or both, "Colonial" or "Liberty" brands. We will gladly deliver it to creameries and cheese factories only free of all cost. Try it, and write us honestly just how it works compared with the salt you have been using for the best.

COLONIAL SALT COMPANY, AKRON, OHIO.

CHICAGO OFFICE.....84 ADAMS STREET

IT PAYS TO DEHORN. Hornless cows give more milk. Hornless steers make better beef.
The best dehorner, the most humane and easiest to use is the **Keystone Dehorning Knife**
Cuts on four sides at once, without crushing or bruising. Highest award at world's fair
Orders with cash filled from Chicago if desired Send for circulars. M. T. PHILLIPS, Box 13, POMEROY, PA

Made for the Man Who Wants the Best.

The Great Western Manure Spreader

Endless Apron

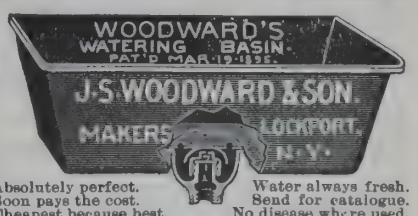
spreads all kinds of manure, fresh, well rotted, fine, coarse, hard, mixed, full of straw, full of corn stalks, etc.

Will also spread **compost, lime, land plaster, salt, wood ashes, cotton seed and hulls,** and in every case do it quicker, better and more evenly than it can be done by hand. Spreads as much manure in one day as twelve men can load and spread by hand and the job is much better when done. Spreads the largest load a team can haul in 2 to 4 minutes. It makes the same amount of manure go three times as far and at the same time produce better results.

REGULATED to spread much or little while in motion. Puts it on thick on poor spots—8 to 25 loads per acre. **ENDLESS APRON**—always ready to load. No turning back into position with crank.

COMBINED HOOD AND END GATE keeps manure away from beater while loading and acts as hood in spreading. Catches all flying sticks, stones, etc. Front wheels cut under, and machine can be turned in its own length. Made in two styles and four sizes. Capacity 30 to 70 bushels. It saves **time, labor and money** and will double the crops. Makes all manure so fine and spreads it so evenly that it is immediately available for plant food.

LARGE CATALOGUE 10 by 13 inches, with 8 large cuts shows the spreader perfectly and describes it fully. Tells also how to apply manure to secure best results. **Mailed free.**



SMITH MANURE SPREADER CO., 16 & 18 S. CLINTON ST., CHICAGO, ILL.

Water In The Stable a Necessity.

It is universally acknowledged that stock in the stable should have constant access to water of suitable temperature, and all progressive Dairymen are putting in some form of Watering Device. **Why not use the Best?** Write for descriptive circular.

GEORGIA Lands Grow Everything

GEORGIA offers the greatest opportunities to settlers and investors to be found in America to-day. It has been overlooked in the rush to less favored but better advertised sections. It is the ideal place for Northern farmers and their sons to locate. Grows all kinds of crops, make permanent and profitable homes, and all at a very moderate cost. The climate of Georgia is perfect, neither too hot nor too cold and is diversified as the land rises from the sea-level to an altitude of 5,000 feet. No blizzards, or violent extremes of weather. The best climate, in fact, to be found anywhere on the continent, for health and comfort with profit. Coal is cheap and abundant, educational and church advantages the very best, water plentiful, transportation facilities good. More than one-half the deposits in State Banks are owned by Georgia farmers.

LANDS in the most desirable sections of this wonderful state can be purchased on long time and at far lower prices than are asked in northern states. There is no more beautiful or fertile land outdoors than Georgia possesses in abundance. Ten months in the year there is open pasturage for cattle. So rich and fertile is the soil, so early and convenient the market, that farms here yield annually 40 per cent of their valuations. Failure of crops is almost unheard of in the entire state of Georgia, and where diversified crops are grown nothing like an unprofitable year was ever known. No better opportunity exists for poultry and dairy farming, cattle, hogs and stock breeding generally. Small fruits and in fact all fruits grow to perfection. GROW any crop here that grows in *your* state, and others that you cannot grow to profit. Ten cent cotton is like dollar wheat. Georgia peaches sell for millions. Finest grasses and open pasturage ten months yearly make dairy farming and cattle raising profitable. Don't misjudge Georgia just because you know little or nothing about it. ***Find out.*** Lay aside any prejudice you may possess and ask for facts, and then investigate for yourself.

Write **GREATER GEORGIA ASSOCIATION, Atlanta, Georgia,** and they will tell you

$10.30 BUYS This 55 Gallon **Food Cooker,**

Buy You a Ticket to **CROOKSTON, MINN.,** and call upon

The Polk County Land & Loan Company

For Choice Red River Valley Farms. They pay railroad expenses if you buy from them. A few good bargains.

360 acre farm, 4¼ miles from Crookston, Minn., a city of 7,000 inhabitants, and 2½ miles from the State Experimental Farm. This is a photograph of the buildings as they are today: House is 16x24 1½ stories with an L 14x22, and a wood shed in connection 20 feet square, all on a brick foundation. Barn 28x48, with a lean to 16x48, sheeted both inside and out. Two granaries, one 14x80, and the other 14x42. The buildings are all well painted and in very good repair, and has a fine artesian well. Every acre of this farm is under a high state of cultivation, and is well drained by a slight ravine running through the farm merely sufficient for self drainage. The soil is a rich, deep black loam with a clay sub-soil, and in every respect is considered to be one of the best farms in that vicinity. Our price on this farm is $35.00 per acre.

This is a **320** acre farm about 2½ miles south of the city, this farm is quite well improved, has a very good house of about seven rooms, 1½ stories, barn large enough for ten head of horses, also a good granary, pasture and an artesian well, also has a good well at the house, good grove around the building. This is a very choice piece of land for the price $32.50.

160 acres north-east of the city; this is all hay land, and located in a German settlement, the surrounding country is nearly all under cultivation; we consider this a good piece of land for an investment, this could all be put under the plow, if desired. Price $19.00 per acre.

YOU CAN....

BUY A FARM

ON PAYMENTS

So easy that you will regret it if you do not investigate. Our lands are

"ADVERTISEMENT."

THE VALUE OF CHARCOAL

Few People Know How Useful it is in Preserving Health and Beauty.

Nearly everybody knows that charcoal is the safest and most efficient disinfectant and purifier in nature, but few realize its value when taken into the human system for the same cleansing purpose.

Charcoal is a remedy that the more you take of it the better; it is not a drug at all, but simply absorbs the gases and impurities always present in the stomach and intestines and carries them out of the system.

Charcoal sweetens the breath after smoking, drinking or after eating onions and other odorous vegetables.

Charcoal effectually clears and improves the complexion, it whitens the teeth and further acts as a natural and eminently safe cathartic.

It absorbs the injurious gases which collect in the stomach and bowels; it disinfects the mouth and throat from the poison of catarrh.

All druggists sell charcoal in one form or another, but probably the best charcoal and the most for the money is in Stuart's Absorbent Lozenges; they are composed of the finest powdered Willow charcoal, and other harmless anti-septics in tablet form or rather in the form of large, pleasant tasting lozenges, the charcoal being mixed with honey.

The daily use of these lozenges will soon tell in a much improved condition of the general health, better complexion, sweeter breath and purer blood, and the beauty of it is, that no possible harm can result from their continued use, but on the contrary, great benefit.

A Buffalo physician in speaking of the benefits of charcoal, says: "I advise Stuart's Absorbent Lozenges to all patients suffering from gas in stomach and bowels, and to clear the complexion and purify the breath, mouth and throat; I also believe the liver is greatly benefitted by the daily use of them; they cost but twenty-five cents a box at drug stores, and although in some sense a patent preparation, yet I believe I get more and better charcoal in Stuart's Absorbent Lozenges than in any of the ordinary charcoal tablets."

SENT under positive guarantee to refund money if not satisfactory. No bolting food. Perfect digestion. All tinned. no rust, easily cleaned.

KEYSTONE CALF FEEDER.

Curing Pea Hay.—Various Questions.

ED. HOARD'S DAIRYMAN:—In reading the communication of P. W. J., of Old Point Comfort, Va., I came to the conclusion that he had better watch over his dairy a little closer. Thirty-five gallons from 26 cows isn't enough. My cows, strippers and all, gave an average of about two gallons or more per day, receiving 2 to 4 lbs. oil meal, a good feed of field corn night and morning, with what hay they would eat; weather hot and flies bad.

If my advice is worth anything, will tell him how I cured my field pea hay. It gave me the best satisfaction of any hay I ever fed. Cut when little too hard for table use, let the leaves become about cured, then rake in windrow. In favorable weather let the stalk become well wilted, then shock; let stand a few days and haul in. Don't let them become too dry; they will finish curing in the barn, nice and green. If let dry too long in field they become bleached and the cows do not like them.

I wish to ask HOARD'S DAIRYMAN how large an ensilage cutter for home use would a 4 or 6-horse gasoline engine run? Are they safe?

Will it pay to feed potatoes at $4 per ton, and squashes at $1 per double box?

Will it pay me for fertilizer to buy hard wood engine ashes at $2 per ton at factory? If so, how best applied?

I run a milk dairy of 13 cows. Does not pay to deliver milk two times a day at 5 cents per quart. How can I best do it once a day and give satisfaction?

What is the relative value of milk compared to bacon, beef, etc., in dollars and cents; milk at 5 cents per quart, meat at 12½ to 15 cents per pound?

The paper of all dairy papers is the HOARD'S DAIRYMAN. G. E.

Newberg, Ore.

A 4-horse gasoline engine will run a 12-inch cutter and 24-foot carrier fairly well, but, all things considered, a 6 or 8-horse engine is much preferable for general farm use. The larger engine will require less gasoline to do the work, because there will be no halts or breaks and no cessation of work to get up motion. Gasoline engines are, and not without good reason, considered the the safest of farm powers.

In the absence of silage or other succulent fodder, a limited amount of potatoes at $4.00 per ton, would probably prove profitable, but 10 to 15 lbs. per day would be as much as should be fed. We are not so certain about squashes—in fact have never known of their being used; but they might be tried, and results determine whether to continue their use.

Ashes at $2.00 per ton would be a cheap fertilizer. Scatter broadcast at the rate of 500 to 1,000 lbs. per acre.

To handle milk successfully for city delivery once daily, the only requisites are cleanliness and cold. As we said, in reply to another correspondent, on page 918, cleanliness consists in excluding bacteria, as well as visible dirt. See that answer for further particulars.

Milk contains from 13 to 14 per cent of solids, all digestible and of the highest nutritive value. A hundred pounds of milk, after deducting for waste, will measure out about 46 quarts and will cost the consumer, at 5 cents per quart, $2.30, or say 16½ cents per pound for the milk solids. The different cuts of fresh beef, after rejecting all bones, contain only from 30 to 50 per cent of edible solids; and bacon and salt pork not more than 60 per cent. At 12½ cents per pound, the edible solids in bacon, corresponding to the solids in milk, would cost 21 cents per pound, as against 16½ cents per pound for equally nourishing milk solids.

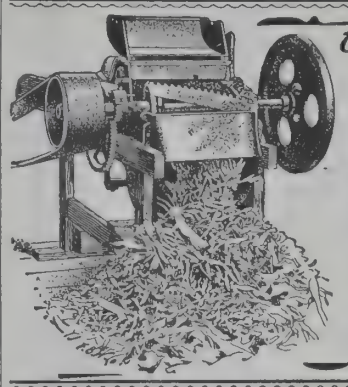
SWEEP GRINDERS $13.75



Grind 46 Bus. Baskets Ear Corn Per Hour.

$13.75 $16.50 $17.25 $17.95 $20.65 $23.25.

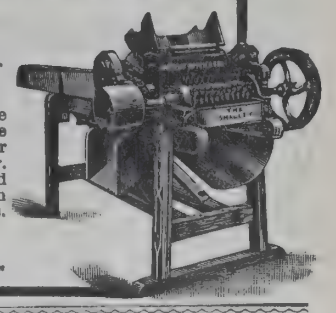
We have six sizes of Sweep Mills at the following prices:

This Improved Wolverine Ball Bearing, Triple Geared Grinding mill. CRUSHES AND GRINDS ear corn in any condition; shelled corn, rye, barley, Kaffir corn, etc. Makes coarse, medium or fine feed as desired. Produces an even and uniform product. It is made of the very best material money can buy. The gears are extra heavy and will CAPACITY. This is a stumbling block in the way of stand any strain. grinding mills. We have tested this one under all conditions with all kinds and quality of grains. Our statement is a guarantee. If the corn is dry, and the team makes five rounds per minute this mill will crush and grind 46 bush. baskets of ear corn per hour. If the team makes three rounds per minute it will grind 28 bus. baskets per hour. LIGHT DRAFT. It is the lightest draft sweep mill known made hardened steel Ball Bearings. OUR OFFER is: If the mill does not do just as we claim, and does not grind more than any two-horse mill made by any other manufacturer of any construction, of any size buhrs; if the mill is not made on more scientific principles. If it does not grind a more uniform quality of feed and if it is not better in every way than any other sweep mill, it may be returned to us at our expense within three days of the time you receive it. Test it in comparison with any other mill and keep the one which is best. CUT THIS AD OUT and send it to us and we will mail you our special farm machinery catalogue. Don't buy a grinding mill of any kind until you get it. It is sure to save you money.

MARVIN SMITH CO. 55. 57. 59. N. JEFFERSON STREET. CHICAGO. ILL.

The 1903 Shredder Blades

(Patent Applied for)

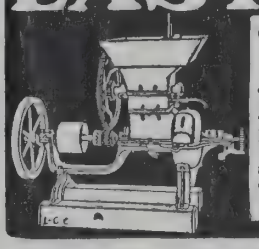


make efficient shredders out of "Ohio" Feed and Ensilage Cutters. The **New Shredder Blade** is the regular "Ohio" knife with solid integrally projecting bits which cut and tear corn stalks into a nicely shredded condition, as shown in the picture. It makes corn-hay of the fodder.

Shredder Blades are interchangeable with knives on all sizes "Ohio" Cutters. They successfully reduce fodder to the proper condition and do not pulverize the leaves like other styles. **They shred** with the same power, speed and capacity as "Ohio" Cutters, and either the Chain or Blower Elevators handle the shredded corn perfectly. **Speed,** 600 to 700 revolutions. **Power,** 2 Horse Tread up to 12 h. p. Engine according to size. Let us send the 1903 catalogue of "Ohio" Cutters and Shredders. "Modern Silage Methods" 10c, coin or stamps. Manufactured by

THE SILVER MFG. CO., Salem, Ohio. *Established 1854.*

THE SMALLEY SHREDDER



HAS NO EQUAL.

It gives fodder the greatest food value, and makes it easier for the animal to masticate and digest. Requires least power; strong and durable; will outlast a dozen of the saw pattern kind. Knives adjustable to compensate for wear. We can furnish snapper rolls to remove all the ears, just the same as a husker. This combination of cutter, shredder and snapper, costs but little more than the ordinary cutter. We also make drag and circular saws, sweep and tread powers, and ensilage cutters with carriers or blowers to reach any silo. Our free catalogue tells all about our goods. Address Box No. H

SMALLEY MFG. CO., Manitowoc, Wis.

EASY GRINDING

Grinds corn with shucks, rye, barley, wheat, oats and all other grains. Self feeders. Geared 7 to 1. Light draft. Great Capacity. (Also make plain sweep and Belt Mills; 10 sizes.)

N. P. D. Bowsher Co., South Bend, Ind.

The Armsaver Husker

works with absolutely no danger. Patent guards prevent it. Works in wet, ice or snow covered corn. Husks 40 to 100 bu. per hr. Lasts a lifetime. Get booklet 11 It tells. Ask about 2-wheel windmills.

Double Power Mill Co. Appleton, Wis. PRICE $190.00

THE $60,000

DAN PATCH 1:56¼

CHAMPION HARNESS HORSE of the WORLD

EATS

3 FEEDS FOR ONE CENT

EVERY DAY.

"International Stock Food" greatly aids Digestion and Assimilation so that More Nutrition is obtained from all grain eaten. It "tones up" and Permanently Strengthens the entire system and Purifies the Blood so that disease is prevented. Every $3.50 pail of **"International Stock Food"** is positively guaranteed to save $7.00 worth of grain. It will cause your Race Horse to have more speed and endurance. It will make your Carriage Horses healthy, fat and beautiful. It will give your Show Horses more life and action and make them glossy. It will make your Work Horses strong, healthy and of great endurance. It will make your Stallions and Brood Mares surer, and your colts will be better and grow and develop more rapidly. **"International Stock Food" is absolutely harmless** even if taken into the human system. It is prepared from Roots, Herbs, Seeds and Barks and is fed in small amounts as an addition to the regular grain allowance. It is equally profitable when fed to Horses, Cattle, Sheep, Hogs, Colts, Calves, Lambs or Pigs. It will make you a large extra profit when fed to your stock for Growing, Fattening or Working. It will increase milk 15 to 25 per cent. in Cows, Mares, Sows or Ewes, and only costs "3 FEEDS FOR ONE CENT." A Dan Patch colt commanded $5,000 at eight months of age. He looked like a yearling and was beautiful, strong and vigorous. The dam was fed **"International Stock Food"** before and after foaling, and the colt as soon as it would eat. Dan Patch became the World's Champion Harness Horse nine months after commencing to eat **"International Stock Food"** every day. If it is good for such horses don't you think it would pay you to test it on yours? Our "International Stock Food Farm" contains 650 acres, 12 miles from Minneapolis, and on it we own Dan Patch 1:56¼, Directum 2:05¼, Roy Wilkes 2:06½, and a band of brood mares. They all eat **"International Stock Food"** every day. **BEWARE OF IMITATIONS and SUBSTITUTES.** There are many worthless imitations on the market, put out by people who seem to think that the way to start a business is to steal as much as they can from some prominent firm. **No chemist can separate and name all of the ingredients used in "International Stock Food," etc., and any chemist or manufacturer claiming to do so must be an Ignoramus or a Falsifier**

A BEAUTIFUL DAN PATCH PICTURE FREE

We have a very fine, large lithograph of Dan Patch with the great driver, M. E. McHenry, in sulky. This Lithograph, Printed in Six Brilliant Colors, is one of the finest and most attractive horse pictures ever published. It is 21x28 and printed on heavy paper suitable for framing.

Stop, Look and Listen

The Sharples Special No. 2, a through train consisting of forty carloads of the famous **Tubular Cream Separators** left the **Sharples Cream Separator Works** at **West Chester, Pa.,** on November 14th, 1903. This entire train load, the largest shipment of cream separators ever made, was sold to dealers in the middle west between the Mississippi River and the Rocky Mountains.

Mr. Dairyman, Mr. Farmer, Mr. Creameryman, Stop, Look, and Listen, then think; a single shipment of more than $350,000.00 worth of cream separators in November when the separator business is supposed to be slack. **Sharples Special No. 2** is the second train load shipment during the year. **Special No. 1** went forward on February 7, 1903, and was at that time the only train load shipment of cream separators ever made. No other separator manufacturer has ever found it possible to make such a sale or to get together so large a shipment. That we are able to do it is due to two facts: First; we have the largest cream separator works in the world. Second; the high state of perfection attained by the **Tubular,** its many points of superiority over competitors and our guaranty makes it the most popular and the most easily sold separator on the market. **Stop, Look and Listen;** isn't this the separator you want? Don't you want our free catalogue No. 144?

Has Not a Larger Official Record Been Made?

ED. HOARD'S DAIRYMAN:—I have not the least disposition to detract from the credit due the great Guernsey cow, Charmante of the Gron, whose official record appears in your issue of the 13th inst. at 11,874.76 lbs. milk and 676.46 lbs. butter fat, but I question the validity of the claim that her record is the best official year's record in the world.

The following account of the record of Belle Sarcastic, a Holstein-Friesian cow owned by Michigan Agricultural College and Experiment Station is condensed from an account published by Prof. C. D. Smith of that institution.

Belle Sarcastic 23039 H. F. H. B. was calved January 1890. Her first calf was born April 1, 1893, her second April 13, 1894. and the third, February 23, 1896. Unfortunately the record of her milk fat for the first period of lactation was not preserved. It extended eleven months. Her next milking period was sixteen months in length, in which time she gave 30,514.2 lbs. of milk, 915.9 lbs. butter fat. The last period, not finished at the time Professor Smith gave account, began March 3, 1896, she gave during fifteen months and one week (up to the date of his writing) 27,219.1 lbs. of milk and 869 lbs. of butter fat. For the first twelve months of milking in 1895 the record was 21,075.8 lbs. milk and 632.78 lbs. butter fat, while for the twelve months in 1896 the record was 23,189.6 lbs. milk and 721.68 lbs. butter fat.

Yorkville, N. Y. S. HOXIE.

DON'T PUT OFF

Seeing your friends and having them join in for a good club of subscribers.

The First Year's Work.

ED. HOARD'S DAIRYMAN:—We find much valuable information in your paper One year ago we began to run our dairy with Hoard for a teacher, bought some of the best native and grade cows we could find, enough to bring our herd up to sixteen, and find for the year ending Nov. 1st they averaged $67.50. These cows also furnished two families with milk and cream.

We also bought a registered Holstein bull of mature age. We find that all of our best cows have some Holstein blood in them and the more of that blood the better the cow.

We expect to make them do better the coming year as we have a silo and last year had only dry roughage. Is this a good enough showing for the first year of our schooling? We sell our milk and cream at wholesale for 12c and 60c per gallon. C. BROS.

Stevens Point, Wis.

Butter Tests Accepted for Publication by the American Jersey Cattle Club, Nov. 19, 1903.

Clarion Girl 161289—Sire, Friar's Duke 36416; dam, Lady Camelia 78458. Butter, 14 lbs., 14 oz.; milk, 300 lbs., 8 oz. Test made from June 8 to 14, 1903; age. 3 years, 6 months; actual weight, 600 lbs. Fed 3 lbs, corn meal; 3 lbs, oat meal, 3 lbs. wheat bran, and 2 lbs. cotton seed meal daily; mixed pasture.

Derby's Lady Ajax 2d 156649—Sire, Smith's St. Lamhert 30332; dam, Darcy's Lady Ajax 79553. Butter, 15 lbs., 12 oz.; milk, 295 lbs., 8 oz. Test made from May 20 to 26, 1903; age, 5 years, 8 months; estimated weight, 950 lbs. Fed about 12 lbs. daily of a mixture of two parts ground oats and one part bran, by measure; June grass pasture.

Duchess of Pioneer 127659—Sire, Mikado, of St. Lambert 30156; dam, Doris of Mt. Pleasant 73330. Butter, 16 lbs.; milk, 207 lbs. 5 oz. Test made from Sept. 17 to 23, 1903; age, 8 ycars, 11 months; estimated weight, 950 lbs. Fed 5 lbs. 8 oz. wheat bran, 6 lbs, cotton seed meal, and 2 lbs. mashed oats, daily; green corn, morning and evening, poor pasture.

Duke's Lallena 161512—Sire, Gray Friar's Duke 42754; dam, King Keffee's Lalla 130419. Butter, 14 lbs., 14 oz; milk, 294 lbs., 1 oz. Test made from May 19 to 25, 1903; age, 5 years, 6 months; estimated weight, 800 lbs. Fed 6 lbs, wheat bran, 5 lbs. corn meal, and 2 lbs. cotton seed meal, daily; silage, mixed pasture.

Geo.'s Maid 156985—Sire, Bachelor of Meridale 40730; dam, Lord Harry's Gem 104195. Test made from Oct, 14 to 20, 1903; age, 4 years, 8 months; estimated weight, 1,000 lbs. Fed 10 lbs. whole oats, and 20 lbs. ensilage, daily; short clover pasture.

King's Yellow Girl 131210—Sire, King Keffee, Jr., 12317: dam, Bachelor's Princess, 106377. Butter, 14 lbs. 10 oz.; milk. 224 lbs., 15 oz. Test made from May 2 to 8, 1903; age, 7 years, 1 month; estimated weight 800 lbs. Fed, 3 lbs. bran, 5 lbs. corn meal, and 2 lbs. cotton seed meal, daily; silage aud mixed pasture.

Smith's Lady Ajax 152048—Sire, Smith's St. Lambert 30332; dam, Darby's Lady Ajax 79558. Butter, 14 lbs., 12 oz.; milk, 269 lbs, 8 oz. Test made from May 19 to 24, 1903; age, 5 years, 8 months; estimated weight, 920 lbs. Fed about 14 lbs. daily of a mixfure of one part corn meal, two parts oats and one part wheat bran, by measure. June grass pasture.

Simply Send a Postal

and ask us to mail you our new illustrated stove catalogue, and we will forward postpaid our complete catalogue of stoves and ranges, which illustrates and describes everything in the stove line for cooking and heating worthy of your consideration—all at prices decidedly low. We sell only the best grades, avoiding the very cheapest. If you want an honestly made stove you cannot afford to place your order until you have seen our stove catalogue. A postal card will bring it.

$4.00 as here illustrated.

$3.20 is our price for a good stove with a 9¾-inch firepot. It is a much better stove than some firms sell at a higher price, but if you want the best send for our stove catalogue and read about our famous Home Oak stoves. The illustration shows our well known Home Oak stove; a very powerful heater made of No. 18 gauge cold rolled steel and finished with artistic nickel plated trimmings. It is 43 inches high, 9¾ inches round and weighs 63 pounds. $4.53 buys larger size weighing 75 lbs.

$5.87 is the price of the most popular size of the Home Oak stove. 48 inches high, 13½ inches round, 13¾ inch firepot, weight 108 pounds. The Home Oak stoves are the best, not the cheapest, and are fully guaranteed.

$1.14

Air-tight heater made better than others on the market and cheapest at our price. We do not sell the cheapest that we can make. This air-tight heater at $1.14 is a better bargain than others at 95 cents up. It pays to buy the best.

$2.88 for an honestly made kerosene oil heater. Other styles, $3.35, $3.68, $4.80, $7.00 and $7.35. 34

Don't waste your money by purchasing a cheap stove. Get an honestly made one even if does cost a trifle more. Our stoves are all honestly made and sold at remarkably low prices. Our free stove catalogue describes our handsome base burners, also a score of other styles—all good, all low priced. You cannot afford to buy until you have heard from us. Simply write a postal card and ask for stove catalogue. We will send it promptly. Address

Eastern Guernsey Breeders Meeting.

ED. HOARD'S DAIRYMAN;–The Eastern Guernsey Breeders Association met at Spotswood Farm, owned by Mr. Edward L. Price, Broad Axe, Pa., on Nov. 19th 1903, The President, Hon. Anthony Higgins, not being present at the opening of the meeting, Hon. E. T. Gill the 1st Vice President, took the chair.

After the calling of the roll, the minutes of the previous meeting were read and adopted.

The names of T. E. Hyde, Bloomsburg, Pa.; William F. Gable, Altoona. Pa.; F. E. Traver, Wyebrook, Pa.; J. Herbert Brown, Swedesboro, N. J.; H. W. Comfort, Fallsington, Pa.; F. C. Lippincott, Camden, N. J; Dr. E. H. Phillips, Cape May, N. J., and E. C. Moore, Woodstown, N. J., were proposed for membership.

The committee on nominations reported favorably upon all names presented for membership at the last meeting. L. J. Shepard, J. M. McCamant, Penrose Larkin, Herbert Warden, C. J. Tyson, Thomas Briggs, Walter Jauncey, B. F. H. Shreve, Joseph Evans, Ezra Evans, C. B Case, W. H. Borden, Wm. I. Tomlinson, R. T. Woodward, R. T. Ridgway, John Tyler, S. H. Gardiner, and P. H. McCormick, were then elected members of the Association.

The chairman announced that Dr. E. B. Voorhees, who it was expected would read a paper at this meeting, could not be present, and to fill in his time it was proposed to discuss this question: "Has the sire or the dam the greater influence upon the offspring in regard to butter production?" The discussion was opened by Dr. C. M. Seltzer. He was of the opinion, that, "as the conditions exist, the sire has the greater influence, because he is better cared for and kept in better condition. The cow is worked hard, she is milked all the time, is expected to produce a calf every twelve months, and consequently there is a great drain upon her system."

Dr. Welsh said, "while we need to look well after the ancestry of both sides, we are likely to overlook the individual excellence of the animal. I would not select a bull of good ancestry without he was a good individual."

Ezra Michener thought the greater influence is on the side of the sire. He said, "You can raise a good cow from a poor one, but you cannot raise a good lot of cows from a poor bull."

Dr. Deitrich, a visitor said: "This is one of the most important of subjects. In the future, breeding will be reduced to a mathematical chart. The sire undoubtedly has the greater influence. The sire puts the hind quarters on his daughters, and the dam puts her hind quarters on her sons." President Higgins having arrived, he now took the chair. Mr. Gill said, "I think the dam has the greater influence on the offspring.

As an illustration, he referred to the Glenwood girl family of Guernseys, where seven daughters from one cow, sired by different bulls were all good.

Mr. Jauncey thought tbe cow exercised the greater influence. He said: "On the Island of Guernsey a bull's dam must be examined by a committee and must score 90 points before her son is allowed to serve a cow."

Dr. Seltzer said: "After all, it is prepotency we are after, and the most prepotent parent has the greater influence,"

The question on the program: "Will the Present Popularity of the Guernseys be Affected by that Breed not Being Represented in the St. Louis Dairy Demonstration?" was then taken up.

GUERNSEY BULL, GLENWOOD'S SHEET ANCHOR OF HADDON, A. G. C. C., 6372.

GLENWOOD'S MAINSTAY, A. G. C. C., 6067.
Property of E. T. GILL, Haddon Farms, Haddonfield, N. J.

Ezra Michener read a letter from Mr. Wm. H. Caldwell, Secretary of the American Guernsey Cattle Club, which explained why the Guernseys will not go to St. Louis. Mr. Michener said: "Our idea when we started the Advanced Register, was, that it would do more toward showing what the Guernseys can accomplish in the production of milk and butter than could possibly be done in public shows."

S. I. Murphy said: "As the Guernseys are showing such good work in the Advanced Register, the popularity of the breed will not be affected. Small breeders should enter their cows for the Advanced Register. I would like to see many more cows go in. A large number of cows entering with creditable records will do more for the popularity of the breed than a few cows entering with phenomenal records."

President Higgins then gave a short account of his trip through England and the Island of Guernsey last fall, after which the meeting adjourned.

When all had partaken of a good lunch the cattle and buildings were inspected. The herd numbers about sixty head and they are a remarkably fine lot. They are mostly imported animals and many of them have won prizes at the great shows in this country and England and on the Island of Guernsey.

Some of the most attractive cows are Princeps No.——; Countess Soucotte IV No. 16497; Red Rose of Sea Grove, No. 15264; Nellie of the Houquetts, No. 13263; France IX No. 16499, who is a granddaughter of France III the great cow imported by H. McK. Twombly; Topsy of the Grandes, No. 16504, and Pride of the Ring, No. 16500, who has a most wonderful founder; Rival and Cock of the Walk, two fine imported bulls head the herd. Mr. Walter Jauncey, the efficient manager at Spotswood said they were the best bulls he could buy in England and on the Island. Three very fine young bulls also claimed attention. Mr. Price deserves great credit for bringing together such a splendid herd of these beautiful animals.

The next meeting of the Association will be the annual meeting, which will be held in Philadelphia in January.

M. M. HOLLINGSWORTH, Sec'y.
Landenburg, Pa.

Wisconsin Butter Makers' Meeting.

As the next Convention of the Wisconsin Butter Makers' Association will be held in Eau Claire on Feb. 2-4, 1904, a few facts concerning the same may be of interest to the membership at large.

Eau Claire is a thriving and prosperous city of about 22,000 population situated on both banks of the Eau Claire and Chippewa rivers and has about 150 manufacturiug concerns within its limits, which employ a large number of laborers who receive annual wages amounting to over $850,000. The capital invested is upwards of $5,000,000.

The city is located upon three lines of railroads, viz., The North-Western System, The Chicago, Milwaukee & St. Paul, and the Wisconsin Central railways, which gives very direct connection to many points. This will be readily understood when it is known that over 100 traveling men make Eau Claire their headquarters.

The hotel accommodations are excellent and will be dealt with in an article later on.

The convention hall and machinery exhibit rooms will be in the new Knights of Pythias building, which is one of the finest in the state. The meeting room has a seating capacity of over 600. The machinery exhibit rooms are on the first floor with direct entrance on the main street. The rooms allow of about 250 lineal feet of exhibit space. The butter exhibit will be across the street from the convention hall, in a vacant store room. The hotels are located conveniently to the convention and exhibit halls.

The citizens are very much interested in having our convention in their city and with the two large daily papers published there, we may be assured of a hearty welcome on their part.

The city has gratuitously pledged itself to give $300 to the premium fund. Every butter maker in the state should live up to his opportunity by attending this, which promises to be, the best state convention we ever held. F. B. FULMER, Sec.
Ettrick, Wis.

Operating a Separator.

Some Factors That Effect Its Efficiency.

The thoroughness with which the separator does its work depends very much on the speed of the bowl, the temperature of the milk, and the flow of milk into the bowl.

SPEED.

The handle should be turned steadily, care being taken to keep a constant even pressure upon it, all the way around, not pushing down hard and pulling up hard, while for a moment when the crank is down and again at the top there is no pressure upon it. Turn at the speed the directions call for, or if it is found by testing the skim milk that it is not skimming clean, an increased speed of from three to five turns per minute will usually help matters. The importance of keeping up the speed is shown by the following two experiments:

"In the first the power was removed from a machine running at full speed and capacity, separating 600 pounds of milk per hour, and the skim milk caught in small lots and tested separately. The following is the record of the test of the first seven quarts of skim milk coming from the machine after the power was removed.

1st	.03 per cent fat in skim milk
2d	.03 per cent fat in skim milk
3d	.045 per cent fat in skim milk
4th	.05 per cent fat in skim milk
5th	.10 per cent fat in skim milk
6th	.12 per cent fat in skim milk
7th	.16 per cent fat in skim milk

In the second case a hand separator was turned at different rates of speed, 42 turns of the crank being recommended by the manufacturers.

The following are the results:

Per Minute.	
45 turns	.02 per cent fat in skim milk
42 turns	.04 per cent fat in skim milk
39 turns	.047 per cent fat in skim milk
36 turns	.05 per cent fat in skim milk

TEMPERATURE OF MILK.

When milk is separated at milking time, unless allowed to stand for some time, it will be at the best temperature for separation and it should be separated then if possible. Cold milk should be warmed up to 80 to 90 degrees. While a can of milk may be set on or near the stove to warm it up, it is better to place it in warm water. When the milk is cold the cream is thicker and if too cold may clog the separator. If necessary to skim cold milk, it will often help matters to adjust the cream screw so as to increase the proportion of cream. As there is usually a large loss in skimming milk too cold, it should be avoided.

Flow of milk, on most hand separators, is fixed by the manufacturers and needs no attention except to see that the faucet does not jar partially shut and that the supply of milk is kept up to the last.

CARE.

The separator does not need much oil at a time, but every bearing requiring oil should have some each time the machine is used. Occasionally the bearing requiring oil should be liberally oiled with kerosene; this will cut out any gum and dirt and help much to keep the machine in an easy running condition.

The relative loss of butter fat in the skim milk from the different methods of of securing the cream is as follows:

	Per cent.
Dilution method	.07 to 0.1
Shallow pans	.05 to 0.7
Deep setting	.02 to 0.5
Centrifugal separator	.03 to 05

There will be at least 3,000 pounds of skim milk from a good cow in one year With the above per cents as a safe basis, one may easily figure the amount of butter fat being lost by the methods he is using. The above figures are for ordinarily good conditions. The losses will be greater when the operator is careless. And on many farms they are greater.

The Michigan Experiment Station se-

cured skim milk from a number of farms and found it contained as high as 1.5 per cent of fat. With average whole milk, only testing about 4 per cent, that proportion of loss is very great.—*Bulletin from Pardue University.*

Notes from the Dairy Department of the Ontario Agricultural College.

There are at present about 50 head of cattle in the herd of the dairy, representing three different breeds and also a number of grades and a few cross-breds. Several of the cows bid fair to make a record, for the present year, of over 10,000 pounds of milk and 350 to 400 pounds of butter. As in previous years the Holsteins are in the lead. Some recent purchases of Ayrshires and Jerseys will strengthen the herd in these two breeds. Two Jersey heifers have been purchased from Dentonia Park Farm at a good price and it is expected that they will add very materially to the value of the Jerseys in the herd. These heifers are among the choicest to be found at Dentonia. They could not have been bought except for educational purposes and the students attending the short courses in Dairying and Live Stock will have the benefit of seeing and judging some good dairy stock during the coming winter.

The butter branch of the dairy has been improved during the year by the addition of a "Success" churn, having a capacity of 500 pounds butter, which is doing good work. It is of Canadian manufacture and marks a distinct advance in the manufacture of butter making machinery. A turbine separator and a carbonic anhydride ice machine are two other important additions to the dairy machinery. At present, the second year students are taking practical instruction in creamery work. This will be completed in time for the Creamery Course students to have all the butter room for their work in December. Formely, this class took work along with the Sophomores, but a change was made this year, whereby, the whole attention of the dairy department will be given to the Creamery Class. For those who can spend but two or three weeks at the Dairy School, this short course is especially commended. Unless the butter makers take more interest in this short course it is probable that it will be cut out from the list of short courses at the College, as the number of students who have been attending in the past, scarcely warrants the expense.

We practice pasteurization of the whole milk all the year, and find that the results are much better than where pasteurization is not followed.

In the cheese department we are adding a machine for making cheese boxes. The cheese box problem is becoming a serious one for many of our factories. The material is becoming very scarce in the older sections, which means that the raw material must be shipped in "knock-down" form. The freight rates are thus very much reduced, and if the cheese-maker can make his own boxes, or have them made at the factory, it will be a great help. It is hoped that students in the regular Dairy School, from January to March, will be able to get sufficient instruction to show them how to make their own cheese boxes.

The special instruction to advanced makers will be continued as in the past. Dairy chemistry, dairy bacteriology, instruction in piping, repairing, etc., will also form a part of the instruction.

Eight different makes of hand separators are now installed in the farm dairy. Setting milk, buttermaking, testing milk, poultry raising and domestic science are also included in the farm dairy instruction. H. H. DEAN.

Dairy Department, Guelph, Can.

Canada Thistles.

Dr. T. J. Burrill, in an Illinois Experiment Station bulletin recommends the following method as the best for exterminating Canada thistles when in full possession of tillable ground:

1. Cut the thistles when in full bloom as close to the ground as possible.

2. Plow about three inches deep and sow millet or Hungarian grass, seeding heavily; harrow. This may follow the preceding at once or after some two weeks' delay.

3. In September plow under the crop or save it for hay, as desired. At all events, plow and seed liberally with rye.

4. Plow under the rye in May and seed again with millet or Hungarian grass, or plant to some hoed crop (corn) and give the most thorough cultivation, with continual searching for and destruction of every remaining thistle.

5. Continue the clean cultivation and sharp lookout for thistles another year.

Although the larvae of several different kinds of insects live in the stems of Canada thistles while others feed more or less upon the roots, and still others eat the foliage, they seem to produce comparately little effect upon the vigor or productiveness of the plants. The American goldfinch, or "yellow bird" often called the "thistle bird" is sometimes unjustly accused of scattering thistle seeds. It does scatter the down from which it has detached the seeds. Thistle seeds form one of its favorite kinds of food, and it is undoubtedly one of the best natural agencies to keep the thistle in check.

Among fungus diseases which attack Canada thistle, the thistle rust, Puccinia suaveolens, is the most destructive. This often prevents the production of seeds and sometimes kills the plant to the ground. It is most effective during wet seasons, but even under the most favorable conditions it rarely spreads so as to destroy all of the plants in the patch. Experiments made thus far in New York, New Jersey and Pennsylvania, in introducing the rust into uninfested patches indicate that while it may often aid materially in checking the growth of thistles, it rarely exterminates them, and its action is too uncertain to warrent more than a qualified recommendation of its use as a thistle-destroying agent.

A Cause for Poor Milk.

ED. HOARD'S DAIRYMAN:—We have a patron at our creamery whose milk has always tested 3.70 and 3.80 and has been up to 4.00. In September it dropped to 3.30 and in October to 3.21. I went to the farm and got samples; three of them tested 2.10, 2.20, 2.20. The cows are in good condition. L. J. H.

Dorr, Mich.

It must be patent to everyone who stops to consider the difficulties in the way, that a stranger, hundreds of miles distant, may well ask to be excused from attempting to solve such a problem as the above. It is not credible that the mixed milk from a herd in which there had been no change of cows, could show such a wide and continued variation in per cent of fat, if samples were properly taken and tests made according to directions.

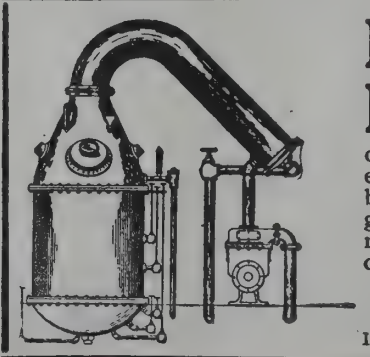
Truth to Tell



There are no other milk cans made that can equal in wearing qualities the genuine

BUHL CANS

They are tinned to stay tinned, and put together to stand years of hard service. Other cans crack easily, become dented, and being lightly tinned soon rust and go to pieces. Not so with the "Buhl Factory," "Improved Elgin" and "Genuine Iowa." They will outlast any other cans on the market, and are thoroughly and quickly cleaned. Remember, the Buhl is the only can in the world that is made with the Buhl "Victor" Can Breast and the Buhl "Victor" Round Handle. As there are many inferior imitations of this can, we stamp all ours with the Milk Can Trade Mark. Look for it. Sold by all live dealers. Ask about them, or write us direct.

BUHL STAMPING COMPANY,
212 W. Larned St., Detroit, Michigan.

Milk Condensing Machine

I supply the most improved machinery and most successful processes for manufacturing all classes of condensed milk and evaporated cream. Factories built complete, put in operation and results guaranteed. If you are interested write for my new illustrated and descriptive catalogue. The only catalogue ever published on the subject.

Mr. Wheaton's Canadian Dairy Notes.

The Cheese Season.—Winter Butter.—A Successful Dairy Season.—Guelph Dairy School.

ED. HOARD'S DAIRYMAN:—The cheese season is being lengthened out this year. Many factories have prolonged their operations during November, and it was reported some weeks ago that several factories were preparing to make cheese all winter. The "slump" in values the past week or two will likely put a stop to such preparation, (and right well it should).

The production of cheese in Canada has been extended so much of late years that a good, solid season of six months will enable us to turn out all that we can dispose of at satisfactory prices in the British market in a year's time. Six months cheese and six months butter if the factories wish to operate all winter, is the plan best fitted to give our dairy business stability in market values, and a uniformity in equality of product, especially in that of cheese.

The season is closing with values lower than they were expected to be two months back. There is not much doing in September and October make just now. The bulk of this quality is now out of the factorymen's hands. Holders are asking 11 cents for straight September and October goods, which is from 1¼ to 1½ cents lower than this quality sold for a year ago at this season. This lower price, even if stocks are larger than a year ago, should cause greater consumption and clear the boards pretty well before the season of 1904 opens.

The business being done at the local markets just now is in late Novembers, which are reported to be of a rather pasty and inferior quality. If this quality prevails in late November goods, what are we likely to expect in winter cheese? The trouble would certainly be more aggravated, and a lot of cheese would be turned out that would seriously injure our reputation in the British markets if exported. The drop in prices is a veritable blessing in disguise, if it induces factories to change from cheese to butter at once.

The outlook for winter butter is good. Stocks are light and holders of choice fall creamery are not selling, believing better things are in store for them. Winter creamery butter is not altogether dependent on the export trade for a market. The local demand for this quality is increasfng every year, and many factories find a ready market for their winter's output right at home. By all means, our dairymen should make butter instead of cheese, during the winter.

Our dairy farmers have had a most successful season. The milk supply has been large, prices have been good, and the returns from the cheese factory the best that this country has seen for a number of years. The farmer with a dozen or two of reasonably good cows has found cheese the greatest cash producing branch of his farming operations.

The success of 1903 will likely prove an incentive to even greater things in 1904. The one thing that will prevent the business from being greatly extended is the scarcity of help. To run the dairy properly efficient help is needed, and this article is getting scarcer every year, especially in Ontario. What the outcome is to be is hard to say. We will have to move backward a step or two, and again introduce the women of the farms to the milking yards.

We would be sorry to see this done. Of late years, the dairy, especially in those sections where it is more or less a business, has, and rightly so, become a part of the men's work on the farm. All hired help is expected to milk and where it is made a part of the regular day's work, has not proven a task that the men have objected to. But the dairy farmer of today is satisfied if he can get a man at all, let alone one gifted in the subtle art of milking a cow. Hence, the difficulty and the possibility of the women being restored to their former duties of "doing the milking."

The dairy school at Guelp in connection with the Ontario Agricultural College, is becoming better equipped each year for giving an all-round dairy education to its students. New machinery and new appliances are being constantly added, and the student of today has a much better chance than his predecessor of a decade ago had.

The dairy stables in connection with the college, are a valuable adjunct to the school. Prof. Dean reports that there are fifty cows of three different breeds with grades and cross breds, in the stables. This year several of these cows will run over 10,000 lbs. of milk, and from 350 to 400 lbs. of butter each. As has been the case for a few of years back, the Holsteins lead. There have recently been added to the herd several first-class Ayrshires and Jerseys. Two Jerseys purchased from Dentonia Park Farm, near Toronto are reported to be of very fine quality and will likely give a good account of themselves next year.

In the buttermaking department of the school there has recently been added a "Success" churn of a capacity of 500 lbs. of butter. This churn is of Canadian make, and is a valuable addition to the equipment. Other recent additions are a turbine separator and a carbonic anhydride ice machine.

A year or two ago, short courses of two weeks' duration were established for creamery men, especially those making butter during the winter. These short courses have been held at a time when it was hoped most of the winter butter makers could attend. But whether these fellows think they need no instruction, or are prevented by other duties from attending, they have not patronized this course to any large extent. Prof. Dean threatens, if the attendance is not increased, to discontinue it altogether.

Though of short duration this course is one of the most important during the term. A great many of those who manage the winter creameries, are cheese makers who have not had an extended training in butter making, but picked it up in a more or less hap-hazard way. For these a little brushing up at the school just before the winter season begins, would be beneficial. Besides certain conditions arise peculiar to the making of winter butter, upon which even the best would be the better for a little brushing up.

An important addition to the cheese making branch of the school is the installation of a box-making machine. The object of having this machine is to teach makers to make or put together their own boxes from the "knocked down" material shipped to them.

The material for making cheese boxes in this country is becoming scarcer, and box makers have to go farther afield to get suitable timber for the purpose. To ship

"CLEANING-HOUSE"

A Change of Food Cleans the Soul's House.

When the body is clogged up by the use of improper food and sickness sets in there is nothing so good as a "house cleaning" and the right way to do this is to change the food, for although taking medicines may afford temporary relief a complete change of food is much the surest and safest way.

The highest medical authority in the world. "The Lancet" of London, says of Grape-Nuts: "Our analysis shows it is a nutritive of a high order since it contains the constituents of a complete food in very satisfactory and rich proportion and in an easily assimilable state" "About two years ago," says a resident of Springfield, Ind., "I had terrible stomach trouble and although I tried all kinds of medicines none of them cured me. I was so run down I could not eat; got very little sleep, and was dizzy headed and miserable all of the time. About that time a friend told me that the only way to cure my trouble was to change my food and recommended Grape-Nuts.

"From my very first meal of Grape-Nuts my stomach began to get better and all the improvements that come from a healthy stomach in place of an unhealthy one soon followed, and this was not all, for just as great an improvement came in my brain. All of the dizziness is gone and my brain is now clear and active. I can eat anything I want, sleep well and am altogether a new man mentally and physically.

"At the time I commenced to use this food I was nothing but a skeleton weighing 130 pounds but now I have got back my normal weight of nearly 200.". Name given by Postum Co., Battle Creek, Mich.

There's a reason.

Reid's Hand SEPARATOR

The "best" separator is that one which does its work most thoroughly and easily, that is built of strongest material, and that is most easily washed and kept in order.

First cost is a great point with a buyer, but ease of running, perfection of skimming and simplicity in washing are even greater considerations.

The Reid Hand Separator has but a single cylinder inside the bowl, and skims as closely as one-hundredth of one per cent. Indeed, some tests indicate "not a trace" of fat in the skim milk.

The Reid is perfectly planned and strongly built, and it literally "runs like a watch."

As to our guarantee of excellence, we make the strongest statement that can be expressed in words: Money back (less freight) if the buyer is not satisfied.

There is a new (free) booklet about the Reid Hand Separator.

Sizes run from 150 lbs. to 500 lbs. per hour.

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of them read dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own light who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

CONCERNING ALFALFA BACTERIA.

Ira Gavelt, of Hood Farm, Lowell, Mass., writes us asking if the bacteria of red clover and alfalfa are the same.

In answer we would say that it is not yet clearly determined whether the bacteria of red clover are the same in species and identity or not. On this point authorities disagree, but in practical work it is noticed that alfalfa flourishes well, as a rule, on soil where red clover flourishes.

We have very much yet to learn concerning the adaptation of alfalfa, as well as red clover, to various soils, and the conditions of those soils. We are inclined to the opinion, however, that the bacteria that infest the roots of all leguminous plants are the same generically, for the reason that the work they do and their effect on the soil is the same.

HIGH TESTING COWS.

J. C. McClymonds, of Portersville, Pa., furnishes the *Jersey Bulletin* with the following test record of his Jersey herd for fourteen months. The record is copied from the creamery books:

1902.	*Test.*
May	6.22
June	5.57
July	5.65
August	6.38
September	6.06
October	6.63
November	6.06
December	6.63
January (1903)	6.63
February	5.17
March	5.65
April	5.98
May	5.98
June	6.02
Average of tests for 14 months	6.045

The cows were registered Jerseys, with only ordinary farm care.

Dairymen who deal with creameries will recognize the fact that the above record is a very rare one. There is only one way such quality can be put into cows, and that is by breeding it in. Here is right where the work of the skillful breeder comes in.

DOES IT PAY TO READ?

Well that depends. Some men can profit by what they read; others cannot. Some men strive to acquire a knowledge of language and the technical terms used to convey information so they may understand what they read; others do not, and pretty much all they read, about the business they are engaged in, is all Greek to them. It has been computed from the best sources obtainable that not more than ten in a hundred of the farmers in the United States who keep cows for a living, provide themselves with books and papers on this question. The one-tenth think it pays. And curiously enough if we look into their ways of carrying on their business and compare it with the other nine-tenths, we almost invariably find that it does pay a big profit to read. Prof. Decker, in his new book, "The Elements of Dairying," gives a list of the bulletins from experiment stations that describe investigations into special lines of important knowledge in dairying. It is interesting to read the list and then reflect that after all they are of no immediate value except to about one-tenth of the men who need what they convey.

Here is the list and the subjects they treat upon:

VISCOSITY IN MILK.

Wisconsin Report 1895 (XII) p. 164; Report 1896 pp. 73-80, Bulletin 54; United States Experiment Station Report, Vol. IX, p. 582.

We have taken the pains to copy the foregoing to show what a wealth of valuable knowledge on important dairy questions lies in the one domain of Experiment Station Reports, all worked out by careful experimental methods. Besides this, are the books on dairying, and last, but not least, the dairy papers like HOARD'S DAIRYMAN and others, which aim to present, constantly, the freshest and most practical experience and information obtainable.

In view of what there is to read, and the great financial importance to the dairy farmer of sound, practical and reliable knowledge, may we not ask:—Can any man who keeps cows for a living, afford *not to read*? Can any such afford to run the great risk of constant waste of his time, capital and labor by refusing to make himself as intelligent as he can on this question? If he cannot read he is excusable. If he can read and will not, what is he?

CROSS BULLS.

We once knew a man who lived among his fellow farmers with the reputation of being morose, surly and unsociable. One neighbor, who had known him from childhood, accounted for his peculiar traits by saying that "he was brought up unsocially as a boy."

There is something in this when applied to men, and we believe it to be true when applied to bulls. As a rule, the bull is kept in a separate apartment, away from all social contact with his kind. He is not made to work and consequently misses this powerful influence for the promotion of the spirit of obedience and docility. He is given but little exercise, is fed well and what wonder is there, if he soon becomes charged with all the power of a cartridge of dynamite and about as ready to go off on slight provocation.

We have never had a cross bull that we had reared to full service ourselves. At the present time there stands at the head of our herd two young Guernsey bulls nearly two years of age, who graze together in the same paddock and who take their turn, night and morning, on the tread power in separating the milk. In the stable, these bulls stand alongside of the cows.

It is astonishing how civilized a member of society it makes of a bull when he has to work like other folks, and is not shut away from his fellows as though he was a criminal.

By this, however, we do not mean to be understood as saying that every bull should be not handled with a full idea that he is liable at any time to become vicious. But the chances of such a collapse are reduced fully 75 per cent if he is

reared in a kind, firm and industrious manner. Half of the deviltry among men and bulls occurs because of a lack of employment. We have often noticed that with boys, for instance, one hour's work was worth two hours of preaching to keep them out of mischief.

The Results of Creamery Patrons' Investigation in Marshall County, Ind.

[Paper Prepared by C. P. GOODRICH for the Indiana Dairymen's Association.

I was employed, last month, by the Indiana State Dairymen's Association, in connection with HOARD'S DAIRYMAN, to gather some statistics of the dairy industry among the patrons of Schlosser Bros. Creameries in Marshall Co. Ind.

The object of this is to make a study of the cow; to find out what kind of cow and what kind of treatment would bring the most net money to her owner. This made it necessary that we should confine our investigations to those who sold the product of the cow all in the same market, and to take account of a full year, which, in this case, was the twelve months ending Oct. 31, 1903.

MANNER OF GETTING INFORMATION.

My manner of proceeding was as follows. I would go to a man and find the average number of cows he had kept, the milk of which had been sold to the creamery. All heifers, after they had had calves, were counted as cows, and all cows were counted, during the period when they were dry as well as when they were giving milk, for they were eating every day.

I then made particular inquiry as to the kinds and amounts of the different feeds the cows had eaten during the year. I charged the cows of each herd the same prices for the same kinds of feed—that which was raised on the farm at the market price at which it could have been sold, and that which was bought at the average price which it was worth in the market.

PRICES CHARGED THE COW FOR FEEDS.

For ear corn and oats ground I charged $17 per ton; wheat bran, $17; oil meal, $30; ear corn, $12; timothy hay, $10; clover hay, $8; corn stover, $2 a load; silage, $2 a ton, and pasture at the uniform price of $5 per head for the summer.

There was some uncertainity about the amounts each farmer fed, for very few of them had weighed any of the feed; most of them could tell very nearly as to the amount of the grain fed, in "gallons," and having done a good deal in the way of weighing cows' rations I could, I think, approximate quite closely to the amount fed.

I figure that a cow will eat, ordinarily, during the winter feeding season, two tons of hay, or its equivalent of corn fodder, if she is not fed too much grain food. Then she could eat less. As to corn stover, I made some inquiry to enable me to set a price on it, and found that very little had been sold, but in a few instances it had been sold at $2 a load, so I charged that for it. All it really costs is the work in saving it, for there are hundreds of acres left in the fields which are practically wasted. It takes 4 or 5 loads of corn fodder to furnish a cow with the two tons of forage she needs, when it is fed on the ground in the ordinary way, as much of it cannot be eaten.

In determining the weight of silage fed, I can come pretty close if I am told the measure. I have found that a bushel basket full, put in loose, weighs, usually about 25 pounds. If it is pressed down with the foot or otherwise it will weigh about 10 pounds more. The winter feeding season was, last year, about 200 days.

FIGURES OBTAINED FROM CREAMERY.

After I had collected all these facts from 50 patrons, I obtained from the secretary of the creamery the amount of milk or cream obtained from each, and the amount of butter fat which it contained, and the amount of money paid for it. The price paid for butter fat averaged higher to some patrons than to others because they furnished a greater proportion at the time when the butter was the highest.

I have used butter fat instead of "butter" for the reason that I believe that is the proper way when determining the ability of the cow, and for the further reason that, in this case, it was not all made into butter but much of it was sold as cream and no one could tell just how much butter it would make. But it was all tested for butter fat and each one was paid in proportion to the amount his milk or cream contained.

CONSTRUCTION OF THE TABLE.

After I had collected all these data, I used the material thus gathered with which to make up the following table, which shows in a condensed form the account with each herd. The cow is given credit here only for the butter fat sold to the creamery, making, in some instances, an addition where a part of the milk was sold to other parties or some butter churned at home. Of course, we know that she produced something more. There was the skim milk, the calf and the manure to help keep up the fertility of the farm. There is also some whole milk used in the family and fed to young calves.

On the other hand we have not charged the cow with the labor of milking and caring for her, or for the interest on the money invested. In my opinion, in most cases, the labor and interest would about balance the credits not given.

Cost of Feed and Income in 50 Herds Belonging to Patrons of Creameries in Marshall County, Indiana, for the 12 Months Ending October 31, 1903.

Patron's number.	No. of cows.	KIND OF COWS.	Cost of feed per cow.	Returns for butter fat per cow.	Pounds of milk per cow.	Pounds of butter fat per cow.	Average price of butter fat.	Average price of milk per 100 lbs.	Value of butter fat for one dollar's worth of feed.	Net profit or loss in butter fat per cow over cost of feed.

* Cream from hand separators delivered to creamery instead of milk.

The patrons are here designated by numbers instead of names. If I should give their names here it might lead, in some cases, to embarrassment that would be disagreeable, (for I suppose most of the patrons I interviewed are here) and prevent me from telling some plain facts, which if told, may do good. Besides this I promised not to give names.

SOME MAKE PROFIT; SOME DO NOT.

It will be seen by looking over this table, that some made a good profit in butter fat sold over the cost of feed, while others did not get enough for butter fat to pay for feed. It would seem that one man should do about as well as another if he used as much intelligence and practiced as good methods in his business. To try and see if we cannot discover the cause of causes of this great difference in results, was the object of this investigation, and of my appearing before you today.

I have selected a few numbers which represent some of the extremes, on which I will give some of the notes I took while making the census, and some comments thereon.

DIFFERENCE IN TYPE.

No. 3. Six cows; 2 Jerseys, balance common cows, dairy type. Cost of feed per cow $26; average ration, ground ear corn, 8 lbs,; corn fodder and clover hay in winter. In summer a very little corn and pasture.

Returns for butter fat per cow, $41.78; average number pounds of milk per cow, 4,920; average number pounds butter fat per cow, 215.7; price of butter fat 19.4 cents: price of milk per 100 lbs., 84.9 cents; value of butter fat for one dollar's worth of feed, $1.61; net profit in butter fat per cow, over cost of feed, $15.78

No. 4. Six cows; grade Durham, beefy type. Cost of feed $25; ration, ear corn, clover and timothy hay and corn fodder in winter. In summer pasture only.

Returns for butter fat $25.89; number lbs milk, 3000; number lbs. butter fat, 130.3; price of butter fat, 19.9 cents; price of milk per 100 lbs., 86.3 cents; value of butter fat for one dollar's worth of feed $1.03; net profit in butter fat per cow, over cost of feed, $.89.

Now these two herds, of the same number of cows each, were fed practically alike; each has good stables, and apparently good care. Why should No. 3 make a good profit, while No. 4 was working for very small wages indeed? When I saw these herds, before I knew anything about what they had produced, I wrote in my notes on No. 3 "dairy type", and on No. 4, "beefy type". Now that is the only reason I can discover for this great difference in results. It is true, no doubt, that the steer calves of No. 4 are worth more for beef purposes than the others, but the heifer calves of No. 3 are worth most to rear for dairy purposes.

POOR FEED AND POOR CARE.

No. 7. 4 cows; 3 grade Jerseys, 1 grade Holstein. Cost of feed $18.50; ration, corn stover and straw and very little bran in winter. In summer, pasture only.

Returns for butter fat, $18.17; number pounds of milk, 2443; number lbs. butter fat, 96.2; price of butter fat, 18.8 cents; price of milk per 100 lbs, 74.4 cents; value of butter fat for one dollar's worth of feed, $0.98; received for butter fat, 33 cents less per cow than the food she ate was worth. His stable was cold, cows poorly cared for. The value of the feed was not much, but the cows did not pay for it, small as it was.

DIFFERENCE IN MEN AS WELL AS COWS FOR DAIRY WORK.

No. 17. 17 cows; one Guernsey, some grade Guernseys, but most of them common cows of no particular breeding, which the owner had selected and bought around in the country, and nearly all of good dairy type. Cost of feed, $27; ration, "oat feed" (cost $13 per ton) 6 lbs.; at times, same amount of bran instead; silage 40 lbs, clover hay and corn fodder in winter. In summer 2 lbs. oat feed and pasture.

Returns for butter fat, $46.95; number pounds milk, 5,436; number pounds butter fat, 239.3; price of butter fat, 19.6 cents; price of milk per 100 pounds, 86.4 cents; value of butter fat for one dollar's worth of feed, $1.74; net profit in butter fat over cost of feed, $19.95. Stable is excellent; cows fastened with swing stanchions.

No. 21—8 cows, ½ of them two-year-old heifers, one 3 year-old, all fresh in fall except two; grade Holsteins except 2 common stock. Cost of feed, $22; ration 2 pounds oat feed, 1¼ pounds oil meal, 45 pounds silage, and corn fodder in winter; in summer, pasture only.

Returns for butter fat, $44.41; number pounds milk, 6,088; number pounds butter fat, 220.4; price of butter fat, 20.1 cents; price of milk per 100 pounds, 72.9 cents; value of butter fat for one dollar's worth of feed, $2.02; net profit in butter fat over cost of feed, $22.41.

No. 23—7 cows. They are a mixed lot of no particular breeding; they are not good dairy type, neither are they good beef type; still they are in good condition, showing they have been well fed. Cost of feed, $20; ration, 2 ears corn, 30 pounds silage, clover hay and corn stover in winter; in summer one ear corn to call them in to be milked, and pasture.

Returns for butter fat, $23.39; number pounds milk, 3036; number pounds of butter fat, 124.7; price of butter fat, 18.7 cents; price of milk per 100 pounds, 77 cents; value of butter fat for one dollar's worth of feed, $1.17; net profit in butter fat over cost of feed, $3.39.

I must make some comments on these last three numbers. They all three fed silage and all have good comfortable stables, but Nos. 17 and 21 made large profits, while No. 23 got but little more than the value of the feed, and the chances are that he would not have got that little profit had he not fed silage. Then why the difference? It is in a great measure because of the difference in the type of cows, but I discovered another reason (no matter how) which may have, perhaps, still more to do with it. No. 21 made, considering the age of his cows, the best showing of the three. Although he did not get the greatest returns per cow, he got the most for a dollar's worth of feed. No. 21 takes excellent care of his cows, doing everything possible for their comfort. He feeds with the utmost regularity and he begins milking at the same tick of the clock every time, no matter what other things are pressing.

No. 23 is apt to consider other work of more importance than caring for the cows, so they are fed and milked when it is most convenient. When there is a rush of work, they are milked, at times, very early in the morning, and at night they are milked when everything else is done. At other times it is the reverse, they are milked late in the morning and early at night. So it happens that the cows never know when to expect to be fed or milked, and no cows can do well in giving milk with such usage.

FED SILAGE TO SOMEWHAT BEEFY TYPE COWS AND GOT FAIR RETURNS.

No. 19—9 cows; grade Angus; most of them of a rather beefy type. Cost of feed, $20.50; ration, a small amount of oat feed, 35 pounds silage, clover and timothy hay and corn fodder in winter; in summer, pasture only.

Returns for butter fat per cow, $36.65; number pounds butter fat (he has a separator and sends cream) per cow, 192; price of butter fat, 19.1 cents; value of butter fat for one dollar's worth of feed, $1.79; net profit in butter fat over cost of feed, $16.15.

It will be seen by this that with the use of silage, for winter feed, so as to provide succulent food the year round, a fair return in dairy products can be had even with cows not strictly of the dairy type.

A FINE DAIRY HERD AND A FINE BEEF HERD.

No. 29—7 cows; Holsteins and Holstein grades, excellent dairy type. Cost of feed, $30; ration, ear corn, 5 pounds; bran, 3 pounds; a little oil meal, shredded fodder, corn stover and clover hay in winter; in summer, pasture only.

Returns for butter fat per cow, $61.09; number pounds butter fat per cow, 316.7; price of butter fat, 19.3 cents; value of butter fat for one dollar's worth of feed, $2.03; net profit in butter fat over cost of feed, $31.09.

(Continued on page 970.)

Dairy Questions Answered by Prof. Farrington.

DELIVERING CREAM TO FACTORY.

We have here a creamery taking both milk and hand separator cream. The milk is delivered now four days per week, both milk and cream are nice and well cared for. How seldom can the cream patrons be allowed to deliver without injury to the product, provided cream is sweet when it reaches us. * * * *

Chippawa Falls, Wis.

On general principles it is not safe to permit the holding of cream at the farms more than two days before it is collected by the drivers drawing the cream to the factory. Even if the cream may be kept sweet a longer time than this, it ripens somewhat by age, and if sweet and old the butter made from it will not possess the fancy qualities of butter made from fresh cream.

At the dairy school, we once held some sweet cream fresh from the separator in a vat where its temperature did not rise about 50°. I wanted to find out if the aging of sweet cream would have any effect on the butter even if the cream was not tainted or soured. This cream was kept sweet for different lengths of time, two, three and four days at a time, and after keeping it, a starter was added and the cream ripened and churned. We found that the butter made from such cream when it was over two days old, had a rather old, inclined-to-be-strong flavor. This showed to us that some flavors, detrimental to fresh butter, are developed by the cream standing, even if it is not sour, for a few days before it is churned.

I was somewhat surprised by these results but was obliged to accept them because the work was repeated several times. This is the only evidence I have to offer on this point, but it seems to me to indicate that it is hardly safe for farmers to keep their cream more than two days before it it collected by the cream haulers. I know there are some instances in which cream is collected only twice a week, but such cream, if kept by itself, will surely make defective butter. The only hope of handling such cream successfully, is to mix it with so large a quantity of fresh cream that the defects of the old cream will be covered up by that of better quality.

When cream ages by standing too long a time, it is very difficult for a butter maker to rejuvenate it and make butter of a fancy flavor from it. More or less successful attempts to do this have been made by adding water to such cream and running it through a separator, then ripening the cream separated, with a carefully selected starter. This practice I think will be successful if it is carefully done by a man who understands his business. I think the final results will be equal to, if not better than when butter is made from the cream without first diluting and separating it a second time. The adding of water and separating such cream a second time will wash out some of the bad flavors and in this way it may increase the price of the butter made from it by one or two cents over what would be obtained from the butter, in case the cream had not been subjected to this treatment.

There will necessarily be a loss, however, by this second skimming because some of the fat will be left in the skim milk, and the total amount of butter made will be dimished, but the increase in price per pound should be enough to overcome the loss in weight.

SELECTING A HAND SEPARATOR.

"I am interested in dairying and will be glad to have you answer the following questions:

Have any experiments been conducted at your station to test the skimming qualities of the different makes of hand cream separators? If so, will you mail me a report containing results of the same?

What is your candid opinion as to the——— separator? Do you use it at the Experiment Station? What other makes do you use at the dairy school? * * *

Brillion, Wis.

We have not made any official tests of of separators at the Wisconsin dairy school or at the Experiment Station. This is a very difficult thing to do because different machines of the same make will vary somewhat in the efficiency with which they skim milk; it is, therefore, not always safe to say that the separators of any particular make are always poor skimmers or that others will always do the best skimming. The efficient skimming of a separator, either hand or power, depends to a certain extent on the skill of the operator running the separator each time it is used. There are, of course, some machines which will permit a greater range in variations of temperature of milk, speed of bowl, condition of the milk, etc., than others, and still do good skimming. That is to say, some separators will skim milk satisfactorily when everything is in perfect order, the milk fresh and sweet and the machine run in a uniform, steady manner. Other separators will do satisfactory skimming when there is a slight variation in speed, temperature or capacity. This characteristic of machines is certainly one that is peculiar to different makes.

The question of durability is another important matter to be considered in selecting a hand separator. This may be determined as well by the past record of separators of different makes as by any other means that I am familiar with. Where a certain make of separator has been in use a number of years and has given satisfactory results without wearing out or requiring many repairs, such a record speaks well for the separator and shows that it is doing the work for which it was made, that is, it is a cream separator that will skim milk enough to more than pay for itself in the saving made over the old method of gravity skimming.

We have each winter at the dairy school about twenty different hand separators in use by the students. The skim milk is tested each time the separators are run but the results obtained may not always be a fair representation of what the separator is capable of doing, because the students are not only learning how to run the separators, but they are also beginners, many of them, in the testing of skim milk. It will, therefore, be an erroneous opinion that would be derived from a table giving the results obtained by our students while they are using hand separators at the dairy school.

The best way to determine which of many different makes of separators is a good one to recommended or use, is to get one of these machines, set it up in the proper manner and make careful tests of the skim milk obtained from the separator when it is being run under normal conditions. It will also be a good plan to get a test of the skim milk when there is some variation from normal in the speed of the bowl, the temperature of the milk, and the amount of milk skimmed per hour. These latter results will show how much the efficiency of the separator is influenced by such abnormal conditions.

In our extensive use of many separators for the past ten years, I have noticed that the hand separator is something like other machines which people own, such as mowing machines or sewing machines. Each person becomes more or less attached to the machine he or she owns and thinks theirs is the best of all those manufactured. This certainly is a good recommendation for a separator as well as for other machines, and if such an opinion is based on carefully made tests, I think the owner of such machines ought to be perfectly satisfied with them.

FLAVOR IN PASTEURIZED MILK.

"It will soon be two years since I spent some time at your school and I feel indebted to you for the information received while there and only wish I could spend one whole year with you. I am holding the same position I accepted when I first came here—foreman of the Sanitary Milk Company which has a capital stock of $50,000. The first year we ran, the company lost money; the second summer the company made a little money and this winter we will barely make expenses as the running expenses are too great. You know when it comes to making money in the milk business the red tape must be done away with. Before I came here the company had con-

"ADVERTISEMENT."

"JUST RUN ACROSS"

Some People Are Lucky.

Some people make an intelligent study of food and get on the right track (pure food) others are lucky enough to stumble upon the right way out of the difficulty just as a Philadelphia young woman did.

She says: "I had suffered terribly from nervous indigestion, everything seemed to disagree with me and I was on the point of starvation when one day I happened to run across a demonstration of Postum Food Coffee at one of the big stores here.

"I took a sample home and a sample of Grape-Nuts as well and there tried them again and found they agreed with me perfectly. For months I made them my main diet and as the result I am restored to my former perfect health and can eat everything I want to.

"When I spoke to my physician about Grape-Nuts he said, 'It is a most excellent food.'" Name given by Postum Co., Battle Creek, Mich.

There's a reason.

Look for the famous little book, "The Road to Wellville," in every package of both Postum and Grape-Nuts.

Everything for Everybody

Tell us what kind of goods you are interested in and we will send you without charge any of the following illustrated special catalogues quoting wholesale prices. Merely mention the number or letter of the catalogue you want.

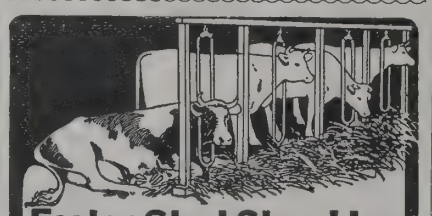
100 Artists' Supplies, 105 Athletic Goods, 110 Blacksmiths' and Machinists' Tools, 115 Builders' Hardware and Supplies, 120 Carpenters' and Builders' Tools and Materials, 125 Crockery and Glassware, 130 Cutlery, 135 Dry Goods, 140 Fancy and Novelty Goods, 145 Farm Implements, 150 Fishing Tackle, 155 Popular Priced Furniture, 160 Harness, 165 Jewelry, 170 Kitchen Supplies, 175 Laces, Embroideries, Ribbons, Trimmings, 180 Lamps and Lanterns, 185 Linoleums, Carpets and Curtains, 190 Men's Hats and Gloves, 195 Men's Shoes, 200 Men's Wearing Apparel, 205 Music and Musical Instruments, 210 Notions, 215 Saddles and Saddlery, 220 Silverware, 225 Sporting Goods, 230 Stationery and Office Supplies, 235 Stoves, 240 Toys, Dolls and Games, 245 Underwear, 250 Vehicles, 255 Wagon Makers' Supplies, 260 Watches and Clocks, 265 Women's Shoes, 300 Women's Catalogue (Cloaks, Furs, Suits, Skirts, Waists, Hats, etc.), B Bicycles, C Baby Carriages, D Dairy Supplies, G Drugs and Patent Medicines, J Telephones and Electrical Goods, K Cameras and Photo Supplies, M Books, R Fancy Grade Furniture, T Trunks, U Youths' and Boys' Clothing, V1 Men's Made-to-Order Clothing, with samples of fabrics. Suits $10.50 to $16.50, V2 Same as V1 except suit prices $18.00 to $30.00, VO Made-to-Order Overcoats with samples, W Men's Ready-Made Clothing, Mackintosh Catalogue, Butterick Fashion Catalogue, GL Grocery List (published every 60 days).

Or, if you want our large 1100-page catalogue, containing practically everything the above smaller books contain, send us 15 cents to help pay the postage—the book itself is free.

Montgomery Ward & Co.,

Michigan Ave. and Madison St., Chicago. 52

32 years World's Headquarters for Everything.



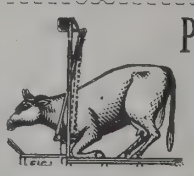
It Depends On the Wrapping

whether butter comes sweet to the table. If you would shield yours from the deleterious odors it encounters—you know how quickly butter absorbs odors—and preserve its own delicate flavors, wrap the prints and line boxes and tubs with

Pioneer Brand Parchment Paper.

It's the ideal butter preserver. Pure vegetable parchment, no smell, no taste. Name of brand printed on sheets so it will not discolor, if desired. But there are parchments and so-called parchments. See that yours is the **Pioneer Brand.** Write us for free samples and book, "Better Butter."

The Paterson Parchment Paper Co.,
37 Eighth Street,
Passaic, N. J.



Foster Steel Stanchion

made entirely of steel and malleable iron. **Unlike all others.** Affords greatest freedom and motion and always holds the animal. Hung on chains—moves all ways. **Lightest, strongest, most convenient** and easiest to open and close.

GOOD SELLER—BIG PROFITS.

One agent sold 75 first day, Another sold 200 first week. **We want responsible agent in every Dairy Community.** Send for circular number 30

FRANK H. BATTLES, Seed Grower,
Rochester, New York.

Prescott's Swinging Swivel tanchion

Keeps Cows Clean.

Swings forward while getting up or lying down. Locks back while standing. Full particulars free.

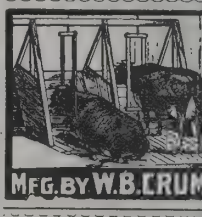
E. PRESCOTT,
Beverly St, Boston, Mass.

This Taylor Stanchion

is made of angle steel lined with hard wood on side next the animal's neck. **It is lighter, neater and stronger than any other stanchion made.** Swings on chains at top and bottom and admits of greatest freedom of motion. Cattle can lay with head on side. Easiest opened and closed. **Reliable Agents Wanted.** Write for special terms, prices, etc.

JAMES BOYLE, SALEM, O.

WILDER'S PATENT SWING STANCHIONS



Chain or Pin Fastened.

Are self adjusting and noiseless. Fasten themselves open when animal is out; swing freely when latch is closed; opened and closed without removing mittens or gloves; keep cattle clean with most freedom of motion; blind bolted and cannot get loose in joints; made of best selected hardwood and furnished with chains or pins as desired.

Safest, Strongest, Most Convenient fastening made. Cheapest to put in and save room in barn. Send for Stanchion Catalog to

J. K. WILDER & SONS, BOX 11, MONROE, MICHIGAN.

Only One Hand

needed to stanchion Cattle if you have our

Steel Latch Stanchion

When open is locked ready for cattle to come in; closed, it swings freely. Best dairy cattle tie because comfortable and quiet; gives greatest freedom. Made of selected hardwood oil finished. We are the sole manufacturers. Write now for circulars and delivered prices.

TOLEDO PLOW CO., Dept. H, TOLEDO, OHIO.

Christmas Presents For All

Christmas time is spending time. Jolly old St. Nick can successfully manipulate the key to our purses when all other attempts fail.

Let us suggest the advisability of buying all your Christmas presents from the largest and most reliable stock in the world selling direct to the user and saving you the jobbers', dealers' and agents' profits.

Our prices are always the same — the lowest. We cannot take advantage of the liberal Christmas spirit and advance our prices as some do, for our regular catalogue figures must stand for all seasons.

We can send you everything you want in one shipment, saving you endless effort and delay in buying from several sources.

By purchasing your entire Christmas needs from us we believe you will save almost one-third of the regular Christmas prices you would pay elsewhere.

It is easy to order from our 1128-page Catalogue No. 72, with fine pictures of the articles you desire, and you can do it all in one evening with scarcely any effort.

Once your order is mailed you need not think of it again until you get the goods, for we will take care of it promptly and carefully, guaranteeing safe delivery and perfect satisfaction.

Your neighbors who know will tell you it is a pleasure to deal with us.

We mention here a few suggestions, all taken from our Catalogue No. 72.

Thousands of other desirable presents for every member of the family, from the hired man down to the baby.

If you have never seen our big catalogue you have missed a great treat. It's never too late to begin, however. Fill in the coupon and mail to us to-day. Don't wait until it is too late to get your goods before Christmas. Although the catalogue costs us almost one dollar each, we make no charge for it, only asking you to send 15 cents to bear part of the postage expense of sending it.

For Men:

Pair of slippers.
Smoking jacket.
Smoking set.
Half dozen dress shirts.
Half dozen colored shirts.

tracted for over two thousand gallons of milk per day at $1.50 per hundred, thinking of course that they could sell it all at retail but as no member of the company had ever had any experience in the milk business they soon learned it was different than they expected. During the first year I made 28,000 pounds of butter, of which one-half sold at one cent above New York price, the balance at retail in this city. You will see from this that the loss was considerable. I simply write this to show you how inexperienced men can be blinded by some sanitary milk plant promoters.

This plant is now running the most successfully of any plant in this section, according to the state inspector; several other plants are closing down. We are using a continuous pasteurizer and I want to ask you if you think the Potts machine will pasteurize our milk and give it a different flavor than the continuous machine when the milk is heated to 140 degrees F, and held at this temperature for fifteen minutes?

I should like to have you send me one pint of milk and one pint cream as you pasteurize it at the school, stating the temperature and machine in which the work was done, as I would like to compare the flaver of your product with that of mine."

* * * * *

Newcastle, Pa.

The difference between the modern continuous pasteurizers now extensively used in sanitary milk depots of cities and the Pott's pasteurizer is in the length of the time that the milk or cream is heated in the two types of machines. The Potts is so constructed that either milk or cream is placed in a cylinder of the pasteurizer where it is heated and the heat maintained for ten to twenty minutes, according to the desire of the operator. With the continuous machine the milk or cream is heated only during the time while passing through the machine, probably in no case longer than one or two minutes.

The influence which these different systems of heating have on the flavor of the product will depend a great deal on the temperature to which the milk is raised. If heated too hot for a long time in the Potts pasteurizer, a cooked taste will undoubtedly be noticed in the milk or cream. This is not necessary, however, as a lower temperature will overcome this cooked flavor. The cooked flavors are not so often noticed in milk or cream heated in the continuous machines, because, although they may be subjected to a higher temperature than in the Potts pasteurizer, the heat is not continued for so long a time. I do not see how it it possible for any particular kind of pasteurizer to be responsible for anything but a cooked flavor in the products pasteurized in it.

There were several instances in this state during the past summer in which the owners of continous pasteurizers got the impression that their machines were responsible for a peculiar flavor in the milk they were selling, but in so far as I was able to investigate the matter, it seemed to me that the flavor was due to some feed the cows were receiving and that the pasteurizers were not responsible for it in any way. It was undoubtedly true that milk which was pasteurized in these machines showed this peculiar flavor more than it was noticed in the unpasteurized milk. I have not been able to discover a good explanation for this fact up to the present time, but as it was noticed in two large cities where two different kinds of pasteurizers were used, this seemed to me to be good evidence that the feed of the cows was responsible for the flavor rather than the particular kind of machine in which the milk was pasteurized.

This objectionable flavor passed away, however, after a month or so, and these two establishments are both using the same machines they used when the bad flavors were noticed. This is the only evidence I have in regard to the flavor noticed in pasteurized products, other than the cooked flavor which may be caused by over heating.

I do not think there would be anything gained by my sending you a sample of the milk and cream we pasteurize, in order that you may compare the flavor of such products with that of those you pasteurize. Such samples would be subjected to great changes in temperature by transportation at this season of the year; they would be at least two days old when you got them and when their flavors are compared with that of your fresh products, I am sure you will agree with me that such comparisous are not fair ones, and that you cannot gain much information from such samples.

I am very glad to hear of your success and shall be pleased to hear from you at any time and to discuss with you any subject that may come up in connection with your work. E. H. FARRINGTON.

Feeding Problem from New Mexico.

Please formulate me a ration out of the following feed stuffs: Alfalfa hay, $8 per ton; gamma grass hay, $5; sorghum fodder, $5; corn, $27; bran, $24; cotton seed meal, $30; oats, $40. No pasture obtainable. We are feeding alfalfa hay alone, and average 1½ gallons a day each, from 20 cows. Would like to do better. We sell the whole milk and get about 30c per gal.

Roswell, New Mexico. E. B. E.

Depending largely upon the present stage of lactation, that is, whether the cows have been milking some months since last freshening and have established a permanent shrinkage in their yield of milk, we should expect an addition of 4 to 8 lbs. of bran and ground corn, equal parts by weight, to the daily allowance would increase the yield; but whether enough to compensate for the extra expense can only be determined by thorough trial. And how about salt? If not now doing so, try giving a heaping teaspoonful night and morning.

MAKE YOURSELF
A CHRISTMAS PRESENT

CHILD'S PATENT

MILK BOTTLE FILLER

Instead of buying something that will soon be used up, get an article that will lighten your labor every day for many years. Every progressive dairyman wants the easiest, cleanest and best bottling machine on the market, if he can get it at a reasonable price. He will find on investigation that

CHILD'S PATENT MILK BOTTLE FILLER

answers all these requirements and besides will save time, money and labor. IT WAS AWARDED THE ONLY PRIZE FOR AUTOMATIC MILK BOTTLE FILLERS AT THE PARIS EXPOSITION OF 1900 and has remained ever since the best machine on the market. It possesses many labor saving devises that are fully explained in our catalogue. Write for it today.

The Distribution of Skim Milk.

It is known that the just complaints of creamery patrons on account of unfair distribution of skim milk are the bane of the separator creamery business. Further disputes among patrons, annoyances to managers, hindrances to the best work of buttermakers, watering the skim milk, and many other ills in the same train are unnecessary, since the

Barber-Coleman Check Pump

has for more than five years been successfully solving the problem in many different creameries. When a patron has dropped in his check he can pump the amount of skim milk called for by his check, less the percentage taken out as cream, so in like proportion to all other checks. Its measuring apparatus is just an ordinary pump which everyone understands and knows how to operate.

Cornish, Curtis & Greene Mfg. Co.,

General Sales Agents De Laval Alpha Separators,
FORT ATKINSON, WIS.

The Results of Creamery Patrons' Investigation in Marshall County, Indiana.

(Continued from page 967)

No. 31—15 cows; grade Short-horns, excellent beef type. Cost of feed, $35; ration, 4 pounds bran, 4 pounds corn, 2 pounds oil meal, timothy hay, and shredded corn fodder in winter; in summer, pasture only.

Returns for butter fat per cow, $22.96; number pounds butter fat, 119.3; price of butter fat, 19.2 cents; value of butter fat for one dollar's worth of feed, $.66; value of butter fat was $12.04 less than cost of feed.

This patron is in the beef business. Many of his cows he does not milk at all, but lets the calves run with them, but those 15 which he milked he selected from his herd, possibly because he thought they were the best milkers, but mainly he said, because they milked "easiest;" got a hand separator, milked the cows, separated the milk, and brought up the calves "by hand." His cows were fed high-- he says about the same as nis fattening steers, and were fat all the time. He told me his calves at weaning time were worth $15 to $20 each, and his 3-year-old steers brought $65 each.

He seems to be doing well, for his keeping so much stock is maintaining the fertility of the soil, so his land is very productive; but is he doing as well as No. 29, who gets more than 2½ times as much per cow for his dairy products, even if his calves and steers do not bring so much?

Scrubs and a Scrub Farmer.

No. 28—Seven cows; grade Jerseys, scrubby looking. Cost of feed, $23; ration, ear corn, 5 pounds; shredded fodder in winter. In summer, pasture only.

Returns for butter fat, $23.48; number pounds butter fat per cow, 125.8; price of butter fat, 18.7 cents; value of butter fat for one dollar's worth of feed, $1.02; net profit in butter fat over cost of feed per cow, $0.48.

Good Cows and Good Care.

No. 42—Two cows; 1 Jersey, 1 grade Jersey, one of them an exceptionally fine looking animal of the best dairy type. Cost of keeping, $30; ration, ear corn and oats ground, 10 pounds, and corn stover in winter; run loose in box stalls; in summer, pasture only.

Returns for butter fat, $46.23; number pounds milk per cow, 4,378; pounds butter fat, per cow, 228.5; price of butter fat, 20.2 cents; price of milk per 100 pounds 105.6 cents; value of butter fat for one dollar's worth of feed, $1.54; net profits in butter fat over cost of feed, $16.23.

Patrons Who Feed no Grain.

No. 14—Six cows; common stock with a little Jersey and Holstein blood, of very good dairy type; fresh in spring. Cost of feed, $19.50; ration good corn stover in abundance, fed in yard in pleasant weather, but when not pleasant, fed in mangers in good comfortable barn.

Returns for butter fat, $38.27; number pounds of milk, 4,743; number pounds of butter fat, 203.6; price of butter fat, 18.8 cents; price of milk per 100 pounds, 80.7 cents; value of butter for one dollar's worth of feed, $1.96; net profit in butter fat over cost of feed, $18.77.

No. 32—Eight cows, common stock, fresh in fall. Cost of feed, $18.50; ration, shredded fodder and corn stover in winter; in summer pasture only.

Returns for butter fat, $16.73; number pounds of milk, 1,962; number pounds of butter fat, 84.2; price of butter fat, 19.9 cents: price of milk per 100 pounds, 85.3 cents; value of butter fat for one dollar's worth of feed, 90 cents; value of butter fat less than cost of feed, $1.77 per cow.

Here we run up against unusual conditions. These two men feed no grain in winter to dairy cows, except what little they might chance to find in the fodder. No. 14 made a good profit and No. 32 suffered a loss. No. 14 told me he used to feed grain, but he was satisfied now that he could make more clean profit without feeding it.

He said he might get a little bigger returns by feeding it, but it was too expensive. He said when he fed grain his cows were all the time looking for it, and would not eat their coarse fodder as well as they did now when they could expect no grain.

No. 32 evidently reasoned the same way, but his results were a sad failure. I suppose you are wondering what made the difference. I think I can make it clear to you. No. 14's cows were fresh in the spring. They were wintered without grain, but fed and cared for so well that they were in fair condition, when they came fresh in the spring, and went on to good pasture, and produced well during the summer.

No. 32's cows were fresh in the fall and they could not keep up the flow of milk on dry fodder without grain in the winter, so when spring came they were so near dry that the summer flow amounted to but little.

While some men get more out of cows that are fresh in the fall than they could get from them, if fresh in the spring, they do it by feeding some grain, and providing succulent food in winter.

A Chapter of Averages.

The number of cows kept by these 50 patrons was 282. Average cost of feed per cow, $24.96; average returns in butter fat per cow, $32.20; average number pounds butter fat per cow, 166; average price of butter fat, 19.4 cents; average amount for one dollar's worth of feed, $1.29; average net profit per cow, $7.24. There were 5 patrons having 45 cows who fed silage last winter, and their average net profit was $16.74 per cow. There were 45 patrons having 237 cows, who did not feed silage, and their average net profits per cow was $5.57—$11.17 less.

Value of Skim Milk.

I asked those I interviewed what, in their opinion, was the value of skim milk for feed. I got answers from 45. They run all the way from nothing to 40 cents per 100 pounds.

The most of them said they did not know just how much it was worth, had no means of knowing very accurately, but they all, with the exception of the two extremes I have mentioned, guessed it to be worth from 10 to 25 cents a 100 pounds.

One man was very positive that the skim milk he got back from the creamery was worth absolutely nothing. One man answered promptly and in a positive manner, "40 cents."

I said, "Do you think you can get that out of it?"

"I know I can, now that I have a farm separator."

"How?"

"By feeding it in connection with other feed to such pigs as those," pointing to a splendid lot of young hogs, which, I think, were thoroughbreds. Then he added, "I could not raise as nice pigs as those without the skim milk."

Does it Pay to Take Dairy Papers?

One other question that I asked each one, was, "Do you take and read a dairy paper?"

Nearly all of them take agricultural papers with a little dairy reading in them, but only 6 of those I asked take any paper especially devoted to dairy. These 6 take Hoard's Dairyman and some of them *The Dairy and Creamery*.

I felt curious to know whether those who took dairy papers made enough more profits out of the business to pay the subscription price of the papers. I figured it up and I find that the 6 who take Hoard's Dairyman averaged in net profits per cow, for butter fat, over cost of feed, $11.07, while the 44 who do not take a dairy paper, averaged, in net profit per cow, only $5.58.— a difference of $5.49 per cow in favor of the man who tries to inform himself by reading the experience of others who are engaged in the same business as himself, and who reads the investigations of scientists, along dairy lines, in the matter of feeding cows and all the other problems that arise to confront the dairyman.

Concluding Remarks.

Now in conclusion, I have to say that you have here a very fine country with a soil naturally fertile, peopled with intelligent and enterprising inhabitants, as is evidenced by the fine farm buildings and the excellent system of drainage which I admired very much.

You have done very well in the dairy business as far as you have been engaged in it. On the average, those I have interviewed in taking this census have made it profitable. Some have made it very profitable, while others have worked for nothing or nearly nothing. It is so everywhere. Here, as elsewhere, there is great room for improvement. That is why we are doing this kind of work, hoping that we can all learn something.

There is one serious criticism I have to make about your dairying here, and that is you don't do enough of it. You ought to do four times as much, and then you could stop the depletion of the fertility of the soil which I see on many farms is going on; you could make more money, have more of the good things of this world while you live, and when you go, you would leave, in the form of a more fertile soil, a rich inheritance to those who come after you.

NEW YORK MARKET.

NEW YORK, Nov. 28—Butter—Receipts for the week, 30,206 packages. Exports for the week, 725 packages.

The price for fancy, fresh creamery has advanced 2½c per pound since our last, owing to a scarcity of high scoring fancy butter, and at the close this style is wanted, while poor to good qualities are plentiful and sell at irregular prices. June make "freezer" butter is dull and to sell any large line, lower prices than our quotations would have been accepted. All under grades of butter are extremely quiet and prices all in buyers' favor. We quote:

Creamery, fresh, extra, 25c; medium, 21@24c; poor, 16@20c; creamery, freezer, extra, 22@23c; medium, 20@21c; poor, 15@18c. New York Dairy, extra, 23@24c; medium, 18@22c; poor, 15@17c.

Cheese—Receipts for the week, 24,691 boxes. Exports for the week, 8,211 boxes.

Market is dull with a full accumulation of late makes full cream and all grades skimmed cheese. These style cheese are being freely offered at lower prices. We note sales to home trade of late October and November full creams at 10 to 11c, and export purchases of poor to fine skims at 3 to 9c. Fancy September cheese are firmly held with light business doing. We quote:

Full cream, extra, 12c; medium, 10@11c; poor, 6@9c.

Eggs—Receipts for the week, 32,824 cases.

The extra price asked for new laid stock curtailed the demand and while prices are no lower, there are better offerings of so called fresh eggs at quotations. We quote:

New York & Pennsylvania, new laid, per doz., 37@38c; Western, & Northern new laid, 33@35c; all sections, poor to good, 25@30c; refrigerator stock, poor to good, 20@26c.

177 Chambers St. DAVID W. LEWIS & CO.

BALTIMORE MARKET.

BALTIMORE, Nov. 27.—Butter—The current receipts are gradually getting lighter every week, and the supply of strictly fancy stock now on the market would be totally insufficient if it were not for the high prices prevailing, which has retarded the demand to some extent, as a great many dealers are in self defense forced to shop around for something that will fill the bill for a little less money, consequently good to choice held stock is in active request. Choice to fancy June creamery is in quick demand. Imitation creamery when the quality is satisfactory meets prompt sale. Fresh, sweet ladles are also in good request. Rolls are in fair supply, and demand, there is a vast difference in quality which accounts for the wide range in values. Packing stock when sweet, meets ready sale. Choice to fancy blocks and prints are in moderate receipt. The demand is good. The market on all desirable grades closes firm.

Creamery separator, extras, @25½c; firsts, 23½@24½c; seconds, 19@22c: June creamery, extra, 24c; firsts, 22@23c; seconds, 18@20; imitation creamery, extras, 20c; firsts, 18@19c; seconds, 15@17c, Ohio & Indiana Ladle, extras 16c., firsts, 15c; seconds; 13@14c; creamery blocks (2 lbs.) extras, 24c; firsts, 22½@23½c; seconds, 20@22c; prints, (½ lbs.), extra, 25c; first, 23½@24½c; seconds, 20@22c; Md. Va. & Penna. prints, extras, 24c; firsts, 22@23c; seconds, 18@20c.

Eggs—Stock of strictly fancy quality continues in very light receipt and the demand for this kind is quite active at 31 cents, while on the other hand the receipts of mixed, held and fresh, though moderate, are fully equal to the requirements, as the trade in general much prefer straight lots of storage stock to the so-called fresh. Market firm on either fresh or storage offerings.

301 Exchange Place. G. M. LAMB & BROS.

SAN FRANCISCO MARKET.

SAN FRANCISCO, Nov. 24—Trading in really fancy creamery butter was closely confined to actual requirements yesterday, and under comparatively moderate supplies, the market continued firm at the prevailing prices. Despite the limited purchases of dealers close clearances of the finer grades were effected, and the maximum rates were obtained for the favored brands without difficulty. There were rather large lines of the cheaper grades of butter on the market, and despite considerable urging on the part of holders, the movement was slow at uneven prices. Storage goods were freely traded in at the familiar prices. The arrivals of ranch eggs were quickly cleaned up at the maximum quotation, and in instances as high as 57½ was obtained for extras. Storage eggs were actively dealt in at full quotations. The general market for eggs ruled firm in sellers' favor and close clearances in all lines were reported at the end of the day. Cheese was without any notable change either in price or market conditions.

Receipts yesterday aggregated 32,200 pounds butter, 608 cases eggs and 4,800 pounds of cheese.

Butter—Creamery, extras, 32@33c; good to fancy, 28@30c; dairy, extras, 24@25c; dairy, choice 22@23c; store, 18@20c; California storage, 24@27c, eastern creamery, 28@25c.

Eggs—Ranch, selected large, 52½@55c; good to choice, 45@50c; store, nominal; California storage, 28@32c; eastern, 25@30.

Cheese—California creamery, mild, new, extra, 14@15c; mild, new, choice, 13½@14c; Young America, 14@15½c; eastern, New York, Cream, Cheddars and Flats, new, 14½@16c.

Wanted at Once—Young married man who understands feeding stock and doing farm work. Must be industrious and like the work. Wife to do cooking for three men during harvest. House and common furniture furnished. Wages $35.00 per month. Steady work and an advance in wages after first year if satisfactory. Address R. E. SCHNEIDER, Grand Marais, Mich.

Wanted—Experienced dairymen to operate dairy of 40 cows on shares. Everything furnished. Gross sales over $5,500 per year. Good chance to man with good references. R. B. FUTHEY, Bellaire, Ohio. R. F. D. 1. 43-2

For Sale—Jerseys, 7 registered heifers and 3 registered bulls, from 3 to 10 months old. Solid color. St. Lambert strains. J. ALDUS HERR, Lancaster, Pa. 42-3

Jersey Bull For Sale—Dam's recorded test is 17 lbs. 4½ ozs. He is a grandson of Landseer's Fancy 29 lbs. ½ oz. in 7 days, 936 lbs. in 1 year. Has won four 1st premiums. Write for description and price. Also two half grown Collies. J. BLACK, Bremen, O. 42-tf

Ayrshires For Sale—I have for sale two excellently bred, registered, yearling Ayrshire bulls ready for service. Price very reasonable. EDW. FINN, Whitewater, Wis. 42-2

Mr. Wheaton's Canadian Dairy Notes.

(Continued from page 965)

the made up box means a large expenditure for some one, and that some one is the maker who usually engages to supply boxes, when he agrees to make cheese at a certain rate per cwt. If the maker could buy the raw material in a knocked down shape, as it is called, and make up the boxes at the factory himself, it would prove a great saving and enable him to get the kind of box required at a much lower cost. Hence, the value of this training in box making which the student at the Guelph school will receive.

An important branch of the school is the farm dairy. To this branch come every year increasing numbers of farmer's wives and daughters, where under the special care of Miss Rose they receive valuable training in the art of handling milk and making good butter. Eight different makes of hand separators do duty in this department.

In the November crop report just issued by the Ontario Bureau of Industries, some interesting data are given as to the position of dairying in this province during 1903. Pastures were excellent and the flow of milk large and uninterrupted. The weather was comparatively cool and large quantities of both butter and cheese made, with the honors in favor of cheese. The high price of cheese the latter part of the season caused a lot of milk to be diverted from butter to cheese. The report says that 1903 has been the most profitable year for cheese, Ontario has ever known.

Grade Durhams are the breed most generally found as dairy cows, more especially in the Western half of the province. In the cheese countries along the St. Lawrence and Ottawa rivers, Holsteins and Ayrshires, with their grades, are equally popular with the Short-horns. Jerseys and their grades come next in popularity.

All dairy cattle are reported to be in tip-top condition and in about the usual numbers. There is abundance of feed and the general outlook for the wintering of live stock is the best. The silo continues to grow in favor, although this season a portion of the corn was not in the best condition for making ensilage when cut.

Toronto, Canada. J. W. WHEATON.

DAIRY UNION'S AFFAIRS.

Full and Complete Statement by the Secretary-Treasurer.

Effects of the New Law on Oleomargarine Output — Union Needs Enthusiastic Workers.

Secretary and Treasurer C. Y. Knight's statement, before the meeting of the National Dairy Union at Waterloo, Ia., of the Union's affairs is given here in full as follows:

The oleomarganine makers of the United States during the government fiscal year ending July 1, 1902, made, according to the report of the Internal Revenue Commissioner of the Treasury department, 126,315,427 pounds of oleomargarine. That was their last year under the old law wherein colored oleomargarine was taxed but 2c per pound. In the manner that butter is loaded in refrigerators, this would amount to 6,031 cars of 20,000 pounds each, or 2,506,000 tubs of fifty pounds.

During the fiscal year ending July 1, 1903, the first year under the new law, these same oleomargarine makers produced 71,211,244 pounds of oleomargarine, of which 68,490,800 were uncolored and 2,720,440 colored, the former paying ¼c tax and the latter 10c. In car lots the production for the last fiscal year was equal to 3,550 car loads of 20,000 pounds each, or 1,424,000 tubs of fifty pounds each.

This was a decrease under the new law of 2,481 carloads or, 1,808,200 fifty pound tubs, or 44 per cent, which would load 103 trains of twenty-four cars each, in face of a market for butter which averaged under the new law 1½c higher for extras in creamery than under the last year of the old law, when the greater amount of oleomargarine was produced.

What does this mean to the dairy public?

It would require 650 average sized creameries to produce in a year the butter necessary to take the place of the 55,000,000 pounds of oleomargarine which the 10c tax law displaced. This butter at an average of 20c per pound would bring the dairymen of this country $11,020,336.

So much for the value of the increased product for which a market has been made.

But, in addition to this, dairymen for the first year under the new law received 1½c more for their butter than during the previous year under the old law. The census of 1900 shows that the creameries of the country during that year produced 439,954,173 pounds of butter. An increase of 1½c per pound upon this product means $6,195,187 in the pockets of the patrons of the creameries alone, which, divided among creameries, means an average increase of $1,500 for the year in the selling price of the butter of the average creamery.

It is safe to say, however, that instead of 1½c per pound, as estimated, the new national law has saved the producers of milk at least 3c per pound, because the market instead of having averaged 1½c higher would have averaged at least 1½c lower as a result of continued encroachments of oleomargarine, the traffic in which increased during the fiscal year ended July, 1st 1902, almost 22,000,000 pounds over the previous year.

Unless some unforeseen condition arises, I estimate that the production of oleomargarine for the present fiscal year will not exceed 50,000,000 pounds, or a falling off of another 40 per cent. I base this estimate upon the fact that during the first four months of the present fiscal year, viz., July, August, September and October, the make of oleomargarine in the city of Chicago is but 114,398 fifty-pound tubs, compared with 182,099 for the first four months of the previous fiscal year—the first under the new law, and 284,764 tubs for the same months of

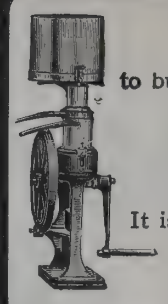
"ADVERTISEMENT."

FORGET YOU EVER HAD IT.

Catarrh, the Most Odious of All Diseases Stamped Out, Root and Branch.

Catarrh is the most foul and offensive disease that afflicts the human race. Any one with social ambitions had better renounce them if he has a bad case of catarrh, for his presence, if tolerated at all, will be endured under protest. The foul, and sickening breath, the watery eyes, the hawking and spitting and fetid discharge at the nose make the unfortunate sufferer the most avoided of human beings.

Stuart's Catarrh Tablets are the hope and relief of catarrh victims all over the world. They go direct to the root of the disease and thoroughly eradicate it from the human system. They cleanse and purify the blood of all catarrhal poisons and under their influence all impurities are carried off. The blood becomes pure, the eye brightens, the head is cleared, the breath becomes sweet, the lost sense of smell is restored, the discharges cease and the sufferer again feels that he has something to live for. He is again a man among men and can meet his fellow-beings with satisfaction and pleasure.



The following letter from a St. Louis lawyer is only one of thousands received praising the merits and curative powers of Stuart's Catarrh Tablets. Read what he says:

"I suffered from catarrh for 15 years. It would be worse at certain seasons than others, but never failed to annoy me and cause me more or less misery during that period. About a year ago I got so bad that I thought of abondoning my practice. I was a nuisance to myself and all who came near me. My condition was very humiliating and especially so in the court room. I had tried, I thought, every known remedy; all kinds of balms, ointments, inhalers, sprays, etc., till I thought I had completed the list. I was finally told of Stuart's Catarrh Tablets by a friend who took pity on me and, as a drowning man will catch at a straw, I got some and began taking them. I began to improve from the first day and I kept up the good work you may rest assured. In six weeks I was as free from catarrh as the day I was born, but to make assurance doubly sure, I continued the treatment for six weeks longer.

"I have had no trace of catarrh in my system since. I am entirely free from the odious disease and feel like a new man. I write this letter unsolicited for the benefit of fellow-sufferers and you may give it as widespread publicity as you wish."

Stuart's Catarrh Tablets are for sale by all druggists at 50 cts. a box.

It Costs But Little

to buy and you are enabled to try at your home and know that the one Cream Separator that satisfies is the

AMERICAN

Chicago, Ill., U. S. A.

1901, when the old law was in force. This is a falling off from last year of 67,601 tubs at Chicago alone, and upon this basis (Chicago producing two-fifths of the Nation's output) there have been 169,121 tubs, or about 425 cars, less oleomargarine made in the Uuited States the first four months of this year than last. Compared with the same months of 1901, the last under the old law, the falling off the past four months has been 451,800 tubs, equaling 1,120 cars or about 70 per cent, the make for the United States for July, August, September and October of 1901 being 679,800 fifty-pound tubs, and during the past four months 228,000 tubs.

Present Legal Status.

Two cases involving the validity of the new law are now in the courts. One, taken up from Cincinnati, will be argued before the Supreme Court of the United States at Washington Nov. 30, a week from Monday, the oleo interests having retained to represent them the best legal talent in the country. The other has not yet gone through the lower court. The only court decision which has been handed down in relation to the law to date, has upheld its validity. The National Dairy Union is watching both cases in court and with the support of the dairying public will see that its interests are properly represented.

However, in the cases in the courts, the government has great incentive to protect our interests. During the first fiscal year under the new law, ended July 1st last, the government collected from makers of colored oleomargarine the sum of $272,044.48 for 10c tax stamps upon the 2,720,440 pounds of artificially colored oleomargarine which they produced in a legitimate way. Added to this are taxes at 10 cents per pound, in shape of fines, amounting to over $200,000, which have been assessed against oleomargarine makers, divided as follows, as nearly as can be ascertained:

Wm. J. Moxley	$28,449.00
Oakdale Mfg. Co	60,000.00
Globe Mfg. Co	40,000.00
Vermont Mfg. Co.	35,000.00
Kingnan & Co	14,000.00
Hammond Mfg. Co	7,000.00
Cudahy & Co.	17,000.00
Total	$201,449.00

These are penalties levied for the use of cottonseed oil containing the forbidden palm oil, used in 2,000,000 pounds of oleomargarine put out under the ¼c tax for the uncolored product. This makes a total of $473,493 in these two items for the past fiscal year alone, which the government would be compelled to refund, should oleomargarine makers win these suits, and added to this would be almost as much more on retail licenses for colored goods, and the amounts paid thus far this year for 10c tax stamps. In short, the Internal Revenue Department has in these suits a stake of nearly a million dollars for the government, making the cases so important that we believe the department will leave no stone unturned to win.

Status of the Organization.

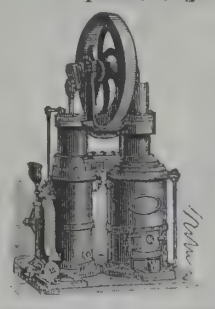
The work of the National Dairy Union during the past year has been one of effort to establish a surplus fund to be used in case of emergency which is certain to arise. At our last annual meeting at Milwaukee, announcement was made that the Creamery Patron's Handbook had been prepared to be placed upon the market for the purpose of raising funds. It was also decided to request creameries to subscribe 1c per tub upon their product to assist in this work.

During the past year over 19,000 of these books have been sold or consigned to butter makers to be sold to patrons. These books cost the National Dairy Union $800 for engravings, composition, imposition, electrotypes and compilation; paper, press work and binding cost $4,336.51. To express them to the nearly 2,000 agents who pushed their sale cost $1,402.65, besides the services of a bookkeeper to keep track of 2,000 accounts ($371 for the year), a stenographer ($781) and the services of the vice-president for a large portion of the year, whose salary at $100 per month amounted to $800 and expenses of $827.59 in attending meetings brought this expense up to $1,627.59, a total of $9,318.75, as nearly as can be figured.

From the sale of the books to Nov. 1 we received in cash $9,487.18, and have in the hands of agents throughout the country enough more unpaid for and unsold to bring in $6,270.25 additional. In short, the profits of the National Dairy Union upon the Patron's Handbook depend upon the successful sale and collection of the 9,000 copies unaccounted for to date.

From the 1c per tub subscription and other contributions $3,940.63 has been received during the year. This has been very largely accomplished through the personal work of Vice President Schilling and Special Agent James A. Harris, the salary and expenses of the latter amounting to $773.77 for the six months he was employed by the National Dairy Union.

Other items of expense for the year are printing, aside from Patron's Handbooks, $759.28; mailing, addressing, etc., outside the office, $224.14; commissions, $62.50; exchange on checks, $60.85; office rent, $177; office expenses, typewriter, etc., $175.85, and $66.25 expense account—the only one incurred during the year by your secretary and treasurer.



The discouraging part of our work is the effort and expense necessary to keep up interest in the cause. It is almost impossible to secure financial support from co-operative creameries without a personal visit from some representative of the National Dairy Union. An analysis of this personal work shows that upon the basis of 1c per tub it costs almost as much to get the money as it amounts to. The average creamery is supposed to turn out not far from 90,000 pounds, or 1,500 tubs of butter per year. While our representatives have only visited the more important co-operatives, those visited when sending in their subscription for the year have shown an average of only about 1,000 tubs. We have spent money visiting many where pledges have been received and no attention paid to their fulfillment. We started in the work a year ago with many promises from prominent concerns which have been forgotten by them, and repeated communications from the secretary's office fail to bring a response. Had we received all we were led to believe would be subscribed, we would have had in our treasury from $4,000 to $5,000 instead of that many hundred.

For the book, hundreds of butter makers have done their work well. Others have received consignments from us, express prepaid, and returned them collect, without even opening the package; not only failing to do anything for us, but practically eating up the efforts of others. As a matter of fact, your secretary has become weary of spending a dollar to collect a dollar, having at the end of the year only a few hundred dollars ($473.78) in the treasury and a few thousand dollars of anticipation and promises. Not only is there no satisfaction in wasting one's time in this way, but this fruitless work is very likely to create the impression that there may be a leak somewhere, particularly when it is shown that without any fight on hand more than $12,000 have been spent in a year. There are many who do not stop to consider the

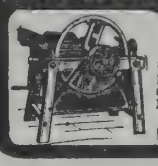
THE SMALLEY SHREDDER



HAS NO EQUAL.

It gives fodder the greatest food value, and makes it easier for the animal to masticate and digest. Requires least power; strong and durable; will outlast a dozen of the saw pattern kind. Knives adjustable to compensate for wear. We can furnish snapper rolls to remove all the ears, just the same as a husker. This combination of cutter, shredder and snapper, costs but little more than the ordinary cutter. We also make drag and circular saws, sweep and tread powers, and ensilage cutters with carriers or blowers to reach any silo. Our free catalogue tells all about our goods. Address Box No. H

Premature Milk Giving.

We have a Holstein heifer, No. 57,379, Holstein-Friesian Herd-Book, was calved Feb. 15, 1901, a good, healthy heifer. She was served Jan. 21, 1903, and was sent out to pasture the middle of May, 1903. About June 1st, we received a telephone message from a man living near the pasture, saying that we had a new milch cow. We sent out there immediately and found the heifer with a very full bag, and leaking milk freely from all her teats. We could find no indication that she had lost her calf, but at that time we thought this must have happened. We continued to milk her; the mess given at the start was about two quarts morning and evening and gradually increased until she was giving about five quarts at a mess, ten quarts per day. We found out later that she had not lost her calf, and endeavored to dry her off before she come in, but this we could not do, and she dropped her first calf on Oct. 27th. last, just as was expected. The calf was large and in every way strong and healthy. The cow is now in good condition and gives about twenty pounds of milk per day. We would like your opinion as to what brought this about. W. W. B.

Little Falls, N. Y.

Cases of this kind are extremely rare, but by no means unknown. There have been probably fifteen to twenty instances of this character reported and published in this paper, most of them heifers under two years of age, and some of them heifers that had not been served. Occasionally it was stated that they had run in pasture with younger stock which had sucked them, and this was believed to be the exciting cause, but there were other instances where the heifers had had no company. Because we could give no better reason, we have thought that this precocity indicated highly developed dairy potency or temperament.

For Pennsylvania Jerseys.

Will you kindly give ration for registered Jersey cows from wheat bran, $21; cotton seed meal, $26; linseed meal, $28; malt sprouts, $17; oats, 40c; corn, 53c; corn fodder and second crop clover for roughage. WM. M. B's SONS.

Gettysburg, Pa.

Of course very much will depend upon the condition of these cows as to length of time they have been in milk and whether it is desired to force them for records. For general work, having regard to offspring as well as most profitable milk production, we should limit the average allowance of grain to about 8 lbs. daily and would use malt sprouts as liberally as each animal would eat them with relish, say 3 to 5 lbs. A little linseed oil meal is always in order—anywhere from ½ lb. to 2 lbs., and for the balance use bran. In addition give roughage *ad libitum*, that is, all each cow will eat without unnecessary waste.

Such a ration would tabulate as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Pro-tein.	Carbo-hy-drates	Ether Ex-tract
12 lbs. clover hay	10.16	.82	4.30	.20
8 lbs. corn stover	4.76	.14	2 59	.06
3 lbs. malt sprouts	2.69	.56	1.11	.05
3 lbs. bran	2.64	.38	1.16	.09
1 lb. oil meal	.91	.29	.33	.07
Totals	21.16	2.19	9.49	.47

This ration, if deficient in any respect, is too low in carbohydrates and fat, the elements most largely concerned in nourishing the animal body and keeping up the body temperature. The smaller the cow and the warmer and better ventilated the stable, the less the demand for carbohy-

MILK and HONEY
You furnish the milk and I will the honey.
Best extracted White Clover Honey, in new tin cans, holding 60 lbs. each. One can 8c. per lb.; 2 cans, 7½c per lb. Cash with order.

☞For Sample Copy of Jersey Bulletin address Indianapolis, Ind.
"IT'S UP TO YOU!"

drates and fat. If the conditions seem to call for a larger supply of these elements ground corn would be the feed to furnish them. Drop out a pound of bran or, sprouts and add 2 lbs of ground corn, or if apparently necessary, add the corn without cutting down either bran or sprouts.

For North Carolina Guernseys.

Please give me a balanced ration for herd of Guernsey cattle weighing I suppose 900 lbs. average. The man in charge says he has good corn ensilage, corn chop, wheat bran, cotton seed meal, wheat shorts or middlings. I read your paper regularly and find it a great help to me in the business I am in. I can talk feed better.
Winston-Salem, N. C. C. E. S.

Please read the answer to Wm. M. B's Sons, of Gettysburg, Pa., in this issue, where some of the general principals of feeding a herd of registered cattle are set forth.

The list of feeds given in the above inquiry lacks one important item: namely something in the line of dry forage. No one who has witnessed the avidity with which a herd of cows will follow a load of straw, even when in the most luxuriant of pastures, can for a moment doubt that this craving for dry forage indicates that the physical condition of the animals demands it. A very little will doubtless suffice, and, in the absence of anything better, cotton seed hulls may be used.

By adding salt daily, as we so frequently advise, because it is a matter sadly neglected, the combination given below ought to furnish a satisfactory average daily allowance.

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
40 lbs. silage	10.56	.52	5.60	.28
6 lbs. cotton seed hulls	5.33	.02	1.99	.10
2 lbs. cotton seed meal	1.84	.74	.34	.17
4 lbs. bran	3.52	.50	1 54	.12
2 lbs. middlings	1.76	.26	1.06	.07
Total	23.01	2.04	10.53	.74

Green Alfalfa.—Corn Fodder.

Will you kindly tell me what amount in pounds of green alfalfa is considered the proper allowance for a milking cow and if more than that amount is pure waste?

Also what amount of wheat bran is the best proportion to combine with linseed meal when the cost of bran is $30 per ton and linseed meal $25 per ton?

Would it be better to feed dry corn fodder in connection with alfalfa, when the corn fodder costs twice as much per ton as green alfalfa.
Mexico, D. F. F. G, M.

While it is true that dry "corn fodder" does not contain twice as much nutriment as green alfalfa, it is also true, we think, that some dry forage should form a part of a cow's feed every day. Prof. Sanborn of New Hampshire, found that dry hay was quite as effective as grain for feeding cows at pasture. Probably this would not hold true if it was desired to crowd the cow to her utmost limit, but for every day service, cows require little or no grain when in good pasture or supplied with green clover or alfalfa. But to keep the digestive tract in good order they do require some dry feed, and corn stover or corn fodder or fodder corn should prove all-sufficient, and both might be given in such amounts as each cow will eat with relish and then lie down and "chew her cud" contentedly. The amounts will vary with different cows and with the same cow at different times but will probably average 50 to 60 lbs. of green alfalfa and 5 to 10 lbs. dry corn fodder.

In the matter of grain, if any seems to be required, we should feed at least as much bran in weight as linseed oil meal, and even then would prefer to add some ground corn to such a mixture—say, all three in equal proportions.

HOLSTEIN-FRIESIAN ASSOCIATION OF AMERICA.
President, HENRY STEVENS; Secretary, F. L. HOUGHTON, Putney, Vt.; Superintendent of Advanced Registry, S. HOXIE, Yorkville, N. Y.
FEES FOR REGISTRY.
TO MEMBERS—Males, $3; females, $1. Double fees for animals over one year of age. Transfers, if recorded within 6 months of date of sale 25c each.
NON-MEMBERS—Males, $5; females, $2. Over one year of age, double fees. Transfers, if recorded within 6 months of date of sale, 50c.; over 6 months, $1. All blanks furnished free.
Life Membership, $25.
Advanced Register in charge of Supt. HOXIE, as above, who will furnish all information and blanks therefor.
Address F. L. HOUGHTON, Brattleboro, Vt., for information relating to Registration of Pedigrees

AS IT IS NOW TIME cattle should be housed we find we must sell thirty-five of our high-bred large producing Holsteins, as we haven't room to stable but 100 head this winter. Visit the Brookside Herd now and secure something choice.
We Guarantee Stock as Represented and to be breeders. Quality unsurpassed. Prices will be reasonable.
STEVENS BROTHERS, Lacona, N. Y.

HOLSTEIN-FRIESIAN BULL CALVES
Do you want one for use this winter which will improve your dairy herd? Do you want him elegantly proportioned, with straight back, high rump, and all the dairy points? Do you want one whose relatives are A. R. O. and eligible to the Advanced Register himself? If so, I have a choice lot, just such as you want.
MALCOLM H. GARDNER, Darien, Wis.

Champion Bull OF THE WORLD
"STAR FARM" offers special opportunities to intending purchasers. Registered Holstein Cattle of choice breeding and individual excellence. The actual sale of nearly one hundred head from this herd within a comparatively recent date is strong evidence. In view of the growing demands on this herd I have determined to publish from time to time some of the many testimonials which I receive from my many customers. Your attention is respectfully called to the following:
'Mr. H. L. Bronson, Cortland, N. Y. Dear Sir: I take great pleasure in writing to you as all of the Holsteins that you shipped me have turned out better than I expected. I realized before purchasing that it was important for me to get the right kind of foundation stock, but confessed that I was a little in doubt as to how this result could be obtained. However, you have solved the problem to my perfect satisfaction. I hope to be able to visit "Star Farm" again this fall and make more liberal purchases from you than before. In the meantime let me wish you the best of success. Very cordially yours, H. WILLIS GAZLAY, Accord, N. Y., 1903.
Phoenix, Arizona, Nov., 1903
Mr. H. L. Bronson, Cortland, N. Y.
Dear Sir: Before starting for the east to purchase Holstein cattle I was informed by local buyers that eastern breeders held their cattle at such long prices that it would be impracticable for me to get a carload for this market. However, I visited "Star Farm" and had no difficulty in obtaining just what I wanted and at very reasonable prices. I can cheerfully recommend all intending purchasers to you and assure them your stock is right and your prices moderate. Expect to visit "Star Farm" again next spring and shall call on you probably for two carloads. Yours truly, A. STARKWEATHER.
Oneida, N. Y., 1903.
Mr. H. L. Bronson, Cortland, N. Y.
Dear Sir: The four Heifer Calves arrived in splendid condition and I am very much pleased with them. Their superior individuality and breeding has already been recognized by the leading breeders of this community. As evidence of more substantial nature of my appreciation of your method of transacting business will state you may book my order for a bull calf from Mercedes Julip's Pietertje's Paul and an A. R. O. cow. Thanking you for the many courtesies bestowed upon me while at "Star Farm", I am, very truly, FRED H. RIVENBURGH.
Hollyrood, Middletown, N. Y., Nov., 1903.
Mr. H. L. Bronson, Cortland, N. Y.
Dear Sir: I trusted to your intregrity as a man and your judgment as an expert to select for Hollyrood fifty registered Holstein Cattle of choice breeding and individuality. The cattle have arrived and after careful inspection I congratulate you upon doing better than you promised and better than I expected.
Very truly yours, JAS. H. WALLICK.
I solicit correspondence of all intending purchasers. I have at the present time about one hundred registered Holsteins to select from and am offering special bargains in cows, service bulls, calves of both sexes. I can save you money, write and get prices and description of cattle before purchasing elsewhere.
H. L. BRONSON, Cortland, N. Y.

LOOK HERE
84 cows and heifers in the McGEOCH HERD have been officially tested with the following results: 10 cows average 20.26 lbs. butter in seven days; average per cent of fat 4.06. 7 four-year-olds average 16.82 lbs. butter in seven days; average per cent of butter fat 3.93. 9 three-year-olds average 15.06 lbs. of butter in seven days; average per cent of fat 3.60. 8 two-year-olds average 12.16 lbs. of butter in seven days; average per cent of fat 3.60. We have a few young bulls out of some of these cows, and sired by Gem Pietertje Hengerveld Paul De Kol, or Sir Ormsby De Kol for sale. One of these is out of a cow that made official record of 24.88 lbs. of butter in seven days; average per cent of fat 4.47. Are these the kind of Holstein-Friesians you wish? If so, can we not interest you in putting a bull from this class of stock at the head of your herd?
For particulars address H. B. Daggett, Mgr., Station A, Milwaukee, Wis. Residence: National Ave., near 40th. Phone, South 1601.

HOLSTEIN BULLS. We have some grandly bred young bulls ready for service. One of the largest and best advanced registry herds in the United States.

DAIRY UNION'S AFFAIRS.

(Continued from page 973.)

fact that the National Dairy Union has been run during the past year almost as a business venture, that it has printed a book and put it on the market at prices lower than any private individual or firm could have afforded to have done it, and that more than 75 per cent of the organization's expenditures have been in the production and handling of this book. Yet I would not think for a minute of bringing this report before the meeting without first having submitted the records of my office to an auditing committee, appointed by the president of an outside interested organization, who has been afforded every facility to verify every item which goes to make up the various totals and who will report his findings here tonight.

In conclusion, I desire to say, as you may readily understand, that I am weary of this work. I have held the office of secretary of the National Dairy Union now for six years. Five years of this time has been spent in the most aggressive warfare ever undertaken by an organization. We passed an anti-color bill in the Illinois Legislature in 1897, only after an almost hand to hand fight in the senate, and having our bill stolen in the house; in the spring of 1899 we passed a a bill creating the Illinois Food Commission to enforce the law of 1897. We then began our active work in behalf of the national law, which required three years of effort, the history of which you are familiar with. We now have before us vexatious, legal and technical questions, which are to those in places of responsibility like an aching tooth; they don't take a great deal of actual physical effort or time, but they keep one in a frame of mind and suspense which prevents him from doing much of anything else.

How are we going to get along without Governor Hoard, I do not know. His name was a source of confidence in the organization and his counsel a continuous balance wheel. It was he who gave your secretary his first insight to what is necessary in securing legistation in behalf of the farmer. So long as his name remained at the head of the organization he could not escape the responsibilites entailed. Governor Hoard has thousands of friends and acquaintances among the dairymen who know no other in the organization. Each one of these friends appeared to feel called upon to write him as president of the National Dairy Union, whenever anything happened that was not understood. He had either to retire from the office, devote a large portion of his time to answering this correspondence, or ignore it. The latter he would not do, and have we any right to expect him to further carry the former burden?

Personally, I feel that I too should be permitted to shift the responsibility which I have carried the past six years. I cannot now see my way clear to continue the work. Justice to my own personal interests and the welfare of those with whom I am associated and those depending on me, demand that I cease to spend time in this great struggle and begin to look out more for my own personal future.

I realize, of course, that during an experience of six years in this work I have made acquaintances and accumulated knowledge which is indispensable to the office. Yet there must be a change sometime. I cannot continue the work forever, and it must always be carried on by somebody or we will very rapidly lose all and more ground than we have gained. There will never be a better time to change than now. So it seems to me that right now is a good time to determine upon some plan or organization for the future, which will put the National Dairy Union upon a solid foundation. This means that promises for its financial support must be arranged for and in some manner that will not cost a hundred cents to collect a dollar.

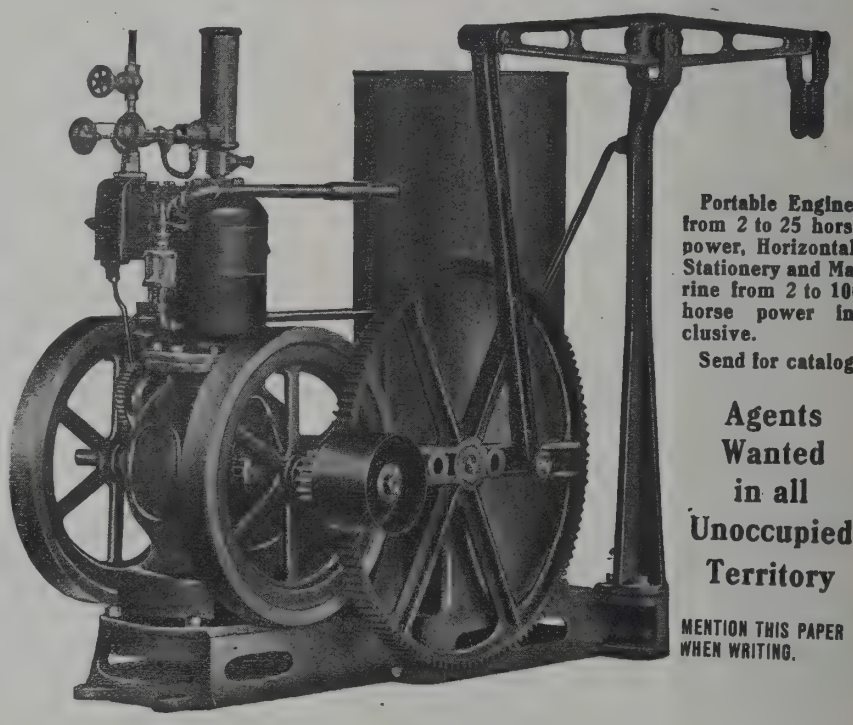
And in final conclusion I will say I have exhausted my ability along this line. In six years I have worked every scheme which my brain can devise for raising funds to carry on the work. I confess I am at the end of my rope, and its up to those who are interested and benefited to decide in regard to the future.

The Value of Dilution in the Gravity Process.

ED. HOARD'S DAIRYMAN:—When we began setting our milk for cream raising, in both shallow pans and deep setting, this fall, we found, at first, that it took 35 pounds of milk for a pound of butter. This was certainly an abnormal amount. It left .71 pounds butter fat in the skim milk residue, which meant about 2 per cent butter fat in the skim milk, or in the buttermilk, or in both. No wonder we said that it would pay us better to shoot the cows than to continue buttermaking on this basis.

This, however, is about the basis most farmer-dairymen are making on these days of November and December. We have seen tests of whole milk no richer in butter fat than this, in the early summer. Such skim milk, certainly, should make first-rate cheese, and it does. Well, we thought this kind of cream raising was a mere fake—a delusion—and so we wanted to see if we could do better,

This action was further prompted from the fact that since we began putting up our butter in nice pound bricks, wrapped in parchment paper, with our name printed thereon, the market for these goods snapped up, while the market for our home make of cheese seemed easily glutted, as people have become so ac-



DON'T BUY GASOLINE ENGINES UNTIL YOU HAVE INVESTIGATED **"THE MASTER WORKMAN"**

A two-cylinder gasoline engine; superior to all one-cylinder engines. Costs less to buy and less to run. Quicker and easier started. Has a wider sphere of usefulness. Has no vibration; can be mounted on any light wagon as a portable. Weighs less than half of one-cylinder engines. Give size of engine required. Especially adapted for irrigation in connection with our centrifugal force pumps. (Sizes 2, 2½, 4, 5, 6, 8, 10, 12 and 16 horse power. Mention this paper. Send for catalogue.

customed to eating factory cheese, and also, by the way, so accustomad to eating inferior, home-made cheese, that the difference in price, the one costing 16 cents per lb., and the other 8 cents per lb. is hardly sufficient inducement. Also the trouble of making home-made cheese from small quantities of milk, in the household every day, makes the women folk kick pretty lively at times As our butter market began to improve, we therefore tried, if possible, to extract more of the butter fat out of the milk,

To this end we tried dilution. We read somewhere that several experiment station demonstrated that the addition of 20 per cent of water to the milk made clean creaming quite possible, but that, as 20 per cent of water was considered objectionable by deteriorating the skim milk, they advised using a dilution of 10 to 15 per cent water.

As we did not consider that the addition of 20 per cent water in any way deteriorated the quality of the skim milk for either cheese making or pig feeding, we resolved to add the full quantity of twenty per cent to the fresh warm milk, and allow it to stand, not 36 hours but 48 hours, before skimming. The result was, that by this change, we were enabled to get one pound of butter from 28 pounds of milk, a gain of seven pounds of milk for butter making. By the dilution process, therefore, we were enabled to have recovered all the fat save .3 lbs., assuming that .86 lbs. fat was required to make a pound of butter. This left 1.08 per cent fat in our skim milk and this gratifying result exceeded our most sanguine expectations.

The average fat content of the herd milk is 4.50 just now, and we think we figure correctly, though we have not tested either our skim milk or butter milk. On the three last churnings we have made, we found that we recovered 7 lbs. butter from 200 lbs. milk; 6¾ lbs. butter from 190 lbs. milk, and 7½ lbs. butter from 210 lbs. milk. These three tests made in the last ten days, show pretty conclusively a pound of salted butter from 28 lbs. milk. With a separator, properly run, we possibly could get 1.27 to 1.37 lbs. butter from this 28 lbs. milk.

The professors figure it one-sixth as the over run of butter, over and above pounds butter fat, which we are sure is too much. For example, it is good separation that skims to .2 per cent. Then a hundred weight of 4.50 milk would yield 4.30 lbs. butter fat. Now, it is also good churning that leaves but .5 of one per cent in the butter milk. If we get 21.5 lbs. 20 per cent cream from this hundred weight of milk, we have, after churning, some 16 lbs. butter milk, containing .08 pounds fat. This subtracted from 4.30 leaves 4.22 lbs. of the original 4.50 recovered. This 4.22 lbs. fat recovered will make one-sixth more butter, 15 per cent moisture, or 4.92 lbs. butter an over run of .42 lbs. This is about what is usually done in good practice when butter not over saturated with water is manufactured and means an over run of about 10 per cent.

It is evident therefore that these tests were conducted by the Babcock tester, calling a pound of commercial butter five-sixths of the fat found by test, is all wrong and impossible in good practice. Adding one-sixth to the fat and calling this a pound of butter is all wrong. Butter, therefore, should not be taken into consideration at all in making a test. It is a horse of another color. The Guernsey breeders are on the right track when they don't take the butter factor into consideration at all in making their breed tests,

The phenomenal cow, Charmante of the Gron, produced 676.48 lbs. fat, but the butter equivalent was just stated to be so—just an equivalent, depending on the skill of the buttermaker

What may be said of the Holstein people, who yet call .8 lb. fat a pound of butter? It is time these people stop imposing their ridiculous figures on the public. A pound of butter, made out of .8 lb. in the milk as it comes from the cow, is no more butter than oleomargarine is, and yet these people emblazon their weekly tests of 80 per cent butter almost every week, as if, further, a weekly test was any criterion of a cow's dairy ability.

But as to dilution. We found that diluting the fresh, warm milk with ordinary cold water, as found in November, usually about 40° F., will not bring results. The addition of this cold water has a chilly, and consequent deleterious effect upon the milk. It chills the fat globules and increases their density, so that the end sought in diluting is not achieved.

Diluting the warm milk with cold water under 50° F. will not have the desired effect, in the fall months at least. This we determined for ourselves. The water used for diluting must be of the same temperature as the milk, say 80° to 90° F. Cooling the milk by the addition of cold water before setting will have a deleterious effect. This Prof. Robertson found, but without adding water. He found that allowing the milk to stand and become cool for an hour or so before setting meant a loss of .8 per cent butter fat.

Another point in diluting. The water used in diluting should be sterilized. It is a very risky matter to add ordinary water to milk, without boiling it, as this water may contain any number of deleterious bacteria. Heat the water, therefore, which you are going to use for diluting, and add it warm, at say 80° to 90°, and set immediately. Add a full 20 per cent; that is, add one-fifth as much milk-warm water as there is milk, and you need not yet buy a costly separator for a while. J. A. M.

P. E. I.

We would call our correspondent's attention to the fact that the Holstein records are now estimated with a factor of 85.7, and the change was made several months ago. ED.

CONCERNING OUR ADVERTISERS

HOW TO TRAP WILD ANIMALS.

We are in receipt of a beautiful illustrated trap book of 36 pages entitled "How to Trap Wild Animals" which contains so much valuable reading matter to all interested in catching the fur bearing animal for profit, or the pests on the farm such as rats, gophers, etc., that we wish all our readers had a copy. The illustrations of the wild fur bearing animal with cuts showing the right way to take off and preserve their skins are very instructive, in fact the whole book is exceedingly instructive to both old and young. This book with an illustrated catalog of guns, traps, knives and hunting boots, also price list of raw hides, furs, etc., will be sent you for a 2c stamp to partly pay the postage by the Northwestern Hide & Fur Co., of Minneapolis, Minn. This is an old reliable firm to whom it is safe to ship your hides, furs, pelts, ginseng, etc. See their ad. on another page. Be sure to mention our paper when writing.

BUGGIES AND WAGONS BY MAIL.

We are occasionly asked by our readers as to the reliability of our advertisers and the advisability of buying by mail. Buying by mail can be as satisfactory as any other way of buying if one deals with reliable firms. There is no risk by the buyer when the privilege of inspection before acceptance is given. The Union Buggy Co., of Pontiac, Mich., advertising in HOARD'S DAIRYMAN, is one of the firms that can be dealt with and receive honorable treatment.

The following, of interest, has just been received from Horace L. Bronson, owner of Star Farm Herd of Holstein-Friesians at Cortland, N. Y.:

HOARD'S DAIRYMAN, Fort Atkinson, Wis., Gentlemen:—On Oct. 5th, 1903, I sold to Mr. J. H. Wallick of Middletown, N. Y., fifty head of registered Holstein cattle. The sale is a notable one in every feature; I believe it to be the largest in point of numbers ever made in this country at private sale, and also that the consideration paid was the largest. Mr. Wallick has for years enjoyed the reputation of a notable theatrical manager and owner. He has spent his leisure hours at his beautiful country seat, Hollyrood, situated about sixty miles from New York. Here he has bred and owned some of the most notable race horses of the day. Recently he determined to curtail the breeding of horses and stock the farm with thoroughbred cattle. After considering the merits of the several breeds he decided in favor of the registered Holsteins. After considering the several propositions submitted to him he decided to make his selections from the Star Farm herd, and he has taken away from the place many cows which the owner disliked to spare. I will not ask for space to describe Mr. Wallick's cattle in detail but will simply mention a few among the great females that he has selected. De Jong's Netherland 2d with an official butter record of nearly 20 lbs., and following this Tula 3d, Susie De Kol Paulette, Daisy Pauline Paul 2d, Rosa Molly of Woodlawn, Auzalette Pauline Paul 2d, Lavina Lily of Woodlawn, Guess Not Pauline 3d, Lady Zo Zo Pauline, Shadeland Tara Paul, Aggie Norondi, Clothilde 2d and others equally good. Many of these cows have been bred to Mercedes Julip's Pietertje's Paul and the fall's increase at Hollyrood will present many of this great bull's sons and daughters. The name of Hollyrood will hereafter be classed not only with the finest horses, but it will be known as the home of one of the greatest Holstein herds in this country today. HORACE L. BRONSON.

VETERINARY.

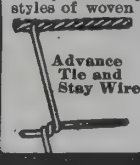
Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

The Bistoury.

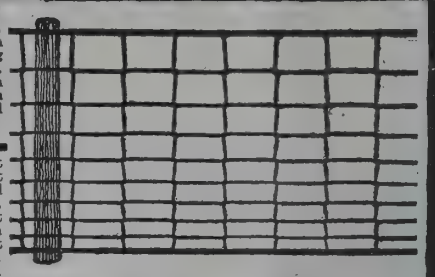
Several of our cows have through sores on the end of the teat, become quite hard to milk. Is there any danger in making too large an opening with the bistoury? P. J. D.
Stevenson, Md.

ANSWER.

There is no danger in making the opening quite large, even if the milk is lost the first day or so, it soon closes to its normal size, which opening is retained by the flow of milk.



Garget.



I have a dairy cow that has been milking about 4 months. Lately I noticed lumps in the milk, first in one quarter, then another, all four quarters have been affected. Now the milk ha

The First Thing to do

If you are going to buy any fence this season, the first to do, for your own protection, is to send for FREE FENCE BOOK

It tells all about ADVANCE FENCING which is without question of doubt the best fencing on the American market. It also tells how you can buy this fence Direct from the Factory at wholesale prices, freight paid to your station, doing away with all dealer's and jobber's profits. It also tells how Advance Fencing is sent to you ON 30 DAYS' FREE TRIAL so that you may have every opportunity of being perfectly satisfied that you have the best that your money can buy. Our Fence Book gives description and prices on twenty-three different styles of woven wire fencing, a fence for every need on the farm, garden or poultry yards, and also tells why Advance Fencing is the most desirable kind to have on the farm. It has many points of merit. It has no loose ends, the stay wire is not cut at the top and bottom as in other fence, but is woven into the top and bottom strands between the stays. The Advance Tie is perfect, the stays cannot slip. ADVANCE FENCE is made of heavy material throughout. You should send for our Fence Book at once, it is FREE. Your name and address on a postal card, directed to us will bring the Fence Book. It pays to keep posted. Write today. Do It Now.

WRITE TO US.

Every farmer should write for our illustrated catalog, explaining all about the DREW ELEVATED CARRIER —how it does the work of a hired man—carries the manure from stable to barnyard —drops it just where desired — returns automatically for another load—and you stay in the barn and "Watch it work for you" —it is self-operating —works perfectly and passes over anything on its trips in and out of the barn. The Drew Elevated Carrier saves more each year than it costs and every farmer should have one. It also carries ensilage, grain, fodder, etc., from one point to another. It does away with the barnyard wheelbarrow.

ILLUSTRATION

CORN KING FEED MILL.

A feed mill of Western manufacture, well adapted to the use of Western feeders, where there is an abundance of corn and large feeding operations, is the fast grinding Corn King shown in the illustration. It is manufactured by the Corn King Feed Mill Company of Waterloo, Ia. It is a sweep mill for two horses, triple geared. The Company's guarantee says that, grinding to the same degree of fineness, it will develop a larger capacity than any two-horse sweep mill on the market. A strong point of difference from other mills is that no additional buhrs are needed for fine grinding, as the all-purpose rings, with which it is fitted, do a wide range of work on ear or shelled corn or corn and oats mixed. Its buhrs are self sharpening, and will continue doing rapid work without dressing until entirely worn out. The mill is most simple, which makes for its longer life and easy running, the particularly light draft in proportion to the great amount of grinding done, being one of its strongest features. Time is saved by the feed being delivered underneath in any convenient sized basket one desires to use. It provides for convenient oiling of all bearings without interrupting the work of the mill. The best way to get a good idea of a good mill is to consult the advertisements of the Corn King Company in another column, and write for their illustrated descriptive circular.

Cancer Cured by Anointing with Oil.

A combination of soothing and balmy oils has been discovered which readily cure all forms of cancer and tumor. It is safe and sure and may be used at home without pain or disfigurement. turned into yellow matter. The cow has great pain when I milk her.

How can I tell if a mare is safe in foal or not?
Racine, Wis. G. S. K.

ANSWER.

1. See garget, this issue.

2. If the mare is pregnant six or seven months, you may detect the foetus by exploring same through the rectum. Insert your hand into the rectum and direct it to the right, downward and forward until you feel the foetus, which can not be mistaken for anything else.

Unknown Disease.

My fresh cows come in apparently well; milk well after cleaning for week or so and then go off feed suddenly, seem feverish, breath feverish and peculiar, seem drawn in and up at flank and eyes sunken. Have to throw away such milk, of course. Attack lasts a week or ten days before they improve. J. M. T.
Port Gibson, Miss.

ANSWER.

Your trouble must be treated according to its cause, which can only be determined by a thorough investigation. It may be an error in feeding.

Treatment for Abortion.

We have a dairy with about 100 cows and have had many premature births and misscarriages in the last six months. In your directions for the treatment of such cases I would like to know whether it is necessary to insert the point of the syringe into the mouth or neck of the womb, or is it sufficient to enter the vagina or cavity before reaching the womb proper?

One of your correspondents speaks of leaving his cow with the bull all day and getting several services. Is not one good service as good as a dozen? F. G. M.
Mexico, D, F.

ANSWER.

No. 1. When injecting for this disease, it is always necessary to introdnce the fluid into the womb, simply letting it run into the vagina is not sufficient.

No. 2. One service is usually considered better than more.

Blood Trouble.

I have a grade Holstein, five years old. She seems well at heart and eats hearty and her hair looks good, but her whole body is covered with blotches the size of a bean; they form in a bunch and they seem to be hard and dry. I noticed it first about ten days ago. M. S. A.
Canisteo, N. Y.

ANSWER.

The enlargements may be due to some humor in the blood. Give the cow 1¼ pounds of Epsom salts with 1 or 2 ozs. of powdered ginger dissolved in 2 quarts of warm water. Give at one dose. Follow this with a tablespoonful each of sublimed sulphur and powdered charcoal in food, morning and night until relieved.

Catarrh, Perhaps.

Last January my colt had distemper or strangles; the disease settled all over him; during the summer he was very weak and poor. Now he is gaining in flesh, but still discharges from the nose; the discharge is a milky color. N. P.
Grafton Co., N. H.

ANSWER.

Your colt may have developed a case of chronic catarrh, the result of strangles. But it is not safe to guess at a case of this kind, as the symptoms also resemble those of glanders to some extent. Have a qualified veterinarian make a careful examination.

GOMBAULT'S
CAUSTIC BALSAM

A safe, speedy and positive cure for

Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

Inquiries and Corrections From Oregon.

Milk Record Blanks—High Priced Feeds.

ED. HOARD'S DAIRYMAN:—Please send me a sample sheet of your record for 10 cows for one month.

Also, I should like to know a good way to feed cows, out here for, milk. There is the best kind of mixed hay here clover, (red and alsike) with different kinds of grasses mixed. Feed is terribly high out here. Wheat bran brings $1.50, middlings $1.75, and oilmeal $2.25 per 100 lbs. Oats are about 60 cents per bushel.

Also, I would like to correct your example in No. October 30, page 849. A. with 190 lbs fat 20¾ cents should be $39.42½ instead of $39.33; and B with 225 lbs. fat, at same price should be $46.68¾ instead of $46.57. GEO. H.

Tillanook, Ore.

If there is any one thing that is especially welcome to us, it is to be assured by evidence like the foregoing, that we have close and discriminating readers. The circumstances, that the errors noted and corrected are comparatively trivial, in no way detracts from the welcome accorded the correction, for the main point is that the reader attends to his reading and intends to profit thereby.

The sample milk record sheet has been sent as requested, and the inquiry for it prompts us to say once more, that the habit of keeping a daily record of what each cow produces daily is one of the essential conditions to largest success in dairying, just as a daily record of sales is a stimulus, guide and help to successful merchandising. When the merchant finds from his daily records that sales are diminishing, he sets about discovering the cause and applying the remedy. It may be the fault of one or more of his clerks, or it may be that old methods are not adapted to modern and changing conditions. Just so the dairyman, with his daily record of what each cow is doing, is in a position to apply a corrective wherever it may be needed. The blanks we have prepared for keeping these records, while not in dispensable, will be found very convenient.

We hardly know what to say about using those high-priced feeds. If the cows have recently freshened, and are what are termed winter milkers, we think it will pay to give them more or less grain, so as to keep up the milk flow. If this is not done, there will be no perceptible increase when the cows go to pasture next spring. Therefore, regard should be had not alone to present returns, but to future profit as well. On the other hand, if the cows are to freshen next spring the main point now is to feed only so much as the cows can use with profit from day to day, and this will vary so widely with different cows that no general rule can be given or average suggested. If the cows appear to need it to keep the digestive tract (stomach and bowels) in good condition, a half-pound of oil meal daily might not be amiss, and more or less bran.

Hungarian Brome Grass—Bermuda Grass—High Priced Feeds in California.

What is the feeding value of Hungarian Brome Grass, also of Bermuda grass for cows? I feed good oat hay, all they will eat and carrots, that's the best I can raise here, but they don't do well on it. What ration would you suggest for each 10 pounds of milk yield. Wheat bran, $27.50, middlings, $30, corn meal, $37.50, rolled barley, $35 to $37.50, oil meal, $40 per ton. Have 12 cows coming in between November and March. Will it pay to feed those high priced feeds to cows that are not large milkers? In April I have vetches, wheat and rye. A, F,

Dows Prairie, Cal,

We are unable to find any satisfactory analysis of Hungarian Brome Grass, otherwise known as *Bromus Inermis*, or of Bermuda Grass, but Prof. Lamson-Scribner of the United States Department of Agriculture says of the former that "its nutritive value is comparatively low" and of the latter that it makes "excellent hay" but because of the difficulty in eradicating it, it should not be introduced upon land which is likely to be used for other crops."

Answering the further inquiry as to using high priced feeds we can do no better than to refer to the answer made to Mr. Geo. Haag, of Oregon, on page 980 who sends us a similar inquiry.

Money Makers For Butter Makers

Behind "Colonial" and "Liberty" Butter Salts stands the great Colonial Salt Company plant—absolutely sanitary, modern, and cleanly

Daily output 750,000 pounds.
Storage capacity 25,000 tons.
Six salt wells 3,000 feet below the surface at our plant—the purest bed of rock salt in the country—daily capacity 400 tons of salt.
Cooper shop capacity 2,000 barrels daily.
3,000 horse power boilers.
Daily supply of coal for evaporating salt, 150 tons.
Absolutely pure water from wells 150 feet deep used to dissolve the salt.
Loading tracks under cover hold 22 cars, while switch outside holds 11 additional cars.
Three trunk lines to the plant, Erie, Pennsylvania, and B. & O., facilitate immediate shipment of orders.
Every step in the process is here done by machinery, from the brine to the salt in the package, thus avoiding any chance of impurities of any kind getting into the salt. All packages are made at the works fresh every day; all cars are packed under cover; thus insuring delivery to the consumer in fresh, sweet, clean packages not soiled in any way.
Of "Colonial" and "Liberty" brands of Butter Salt

THE FLAVOR IS PERFECT
THE COLOR PERFECT WHITE

The purity the highest known, over 99 per cent. They are the lightest salts for the same bulk that there is on the market today; dissolve quickly and evenly, do not wash out in the working nor leave the butter gritty or mottled.

"Colonial" Butter Salt (light flaky grain) and "Liberty" Butter Salt (granulated, every grain the same size and perfectly square) may be tried absolutely free of cost by all who have never used them. A 56 pound sack of either or both will be delivered free on request, in return for which you are asked to report to us your actual success with them.

COLONIAL SALT COMPANY, AKRON, OHIO.

BUTTER FOR UNCLE SAM

THE CONTINENTAL CREAMERY COMPANY
TOPEKA, KANSAS

Has been awarded the contract to supply the United States Navy with half a million pounds of butter for the ensuing year.

For this purpose only the best quality of butter is used, and its keeping quality must be made of the very best, owing to the fact that the entire year's supply must be made within a few months and it is carried through all conditions of climate.

The government has made a thorough study of supplying butter to suit the requirements of the Navy and as a result it has laid down some very exacting standards to which those who bid for these contracts must comply. One of the few concerns who can fulfill these requirements is the Continental Creamery Co. and it was awarded this contract, which is the biggest single order for butter ever filled.

This company produces the greatest quantity of fancy creamery butter in the world, all of which is made from pasteurized cream. Surely it knows something about making good butter. It also knows from actual experience and the investigations of its chemists, that one of the factors in making good butter is

Dairying in Kansas.

[Introductory by Secretary F. D. Coburn, in the September, 1903, Quarterly Report of the Kansas State Board of Agriculture, entitled "Modern Dairying."]

Twenty years ago Kansas had but 471,548 milch cows, and scarcely a creamery worth the name, and their product was unsought.

Ten years ago Kansas had 567,353 milch cows; creameries of a better class were being slowly established, but their output begged a market.

Today Kansas has 802,738 milch cows, or more than at any previous time, and many high-grade creameries and cheese factories, including the largest creamery in the world, hundreds of contributary receiving and skim stations, and their product is not only favorably known in the principal markets, but sought beyond the supply.

Thus is marked the progress of this industry in Kansas—in a decade become one of the most prominent of successful dairy states. While this is true, and within that time the aggregate annual value of our dairy products has nearly doubled, and while our foremost dairymen, by constantly striving to raise the standard of production, now have excellent high-yielding herds, it is unquestionably a fact that large numbers of our cow population are not paying for their keep, judging by the low annual average value of produce per herd.

The cause for this is to be found either in the man or the cow, or both, as Kansas, with her wealth of grain and grass, produced at the minimum cost, mild winters, and convenience to market, furnishes ready made a territory nowhere excelled for profitable dairying; but brains in the man and blood and feed in the cow are essential to success in Kansas, as elsewhere, although here nature has seemed to be most lavish in her beneficence.

If the "man behind the cow" in Kansas would do his part, no unprofitable animal would masquerade under the fictitious appellation of "milch cow," and she would either go to the butcher's block or be made to return a profit by more intelligent care and management. It passeth understanding why theft by a cow should be tolerated more than theft by a human. In effect, the result to the loser in either case is the same. Our government has found it wisdom to study and establish far-reaching methods for the detection and repression of the latter; and by the same token, why should our farmers and dairymen be less vigilant in regard to this possible proclivity in their cows—beasts described as dumb, yet outwitting their owners? So long as cows of this class are permitted in the dairy herd, so long will there be dissatisfaction and failure. Improvement is the route to success, whether by breeding, better management, or other way, and intelligence in our cowmen is the power that will force advancement in the right direction.

Dairying has come to be one of the most important factors in Kansas agriculture, and, rightly conducted, is one of the surest money-makers of our varied industries. It is incomparably more rational than any one-crop system, or even general farming, as its practice tends to rotation of crops, maintains or increases the fertility of land, and affords steady employment, with return remunerative according to the brains mixed with the business.

Ever since the issuance of this Board's publication entitled "Cow Culture" there has been an extraordinary demand for kindred literature, and editions of former reports on the subject of dairying have been early exhausted. The spirit of education is abroad in our state, and in order in a measure to meet the increasing urgency for light and literature concerning dairying, this volume is prepared. The information it contains covers the best modern thought of well known authorities upon the respective topics treated, and is intended to be of practical value to our farmers aud dairymen, as well as to promote the prosperity of our creameries and cheese factories—the interests of all these being inseparable.

As dairying in our state has assumed such immense proportions, a matter that has been given comparatively but little attention heretofore is also taken up, viz., the advisability of observing certain sanitary and other precautions in the production of milk, in order that the output, in whatever form, from cow to consumer, may be the most wholesome possible. This is not only prudent, but certainly

Test of the Scales

There is not a time in the life of a mature beef when Dr. Hess Stock Food cannot be fed with a decided profit, as the test of the scales will prove. Dr. Hess Stock Food causes every organ to perform its proper function, it furnishes the laxatives so liberally supplied in grass, improves digestion and assimilation, regulates the kidneys and liver, and in fact forces growth and development by compelling the system to appropriate to bone and muscle building the nutrition contained in the food eaten.

Dr. Hess STOCK FOOD

is the only scientific stock tonic on the market. It is formulated by Dr. Hess (M. D., D. V. S.). If the medical and veterinary colleges know of nothing better it must be good. No unprofessional manufacturer can equal it.

Our Information Bureau.—For any disease or condition for which Dr. Hess Stock Food is not recommended, a little yellow card enclosed in every package entitles you to a letter of advice and a special prescription from Dr. Hess (M.D., D.V.S.). In this manner you are provided with a universal treatment for all stock diseases, either in the Stock Food itself or in the special prescription to which the little yellow card entitles you. Indorsements from physicians, scientists and feeders furnished on application.

Dr. Hess Stock Food is sold on a written guarantee, 100 lbs. for $5.00 (except in Canada and Pacific Slope); **smaller quantities at slight advance. Fed in small dose.**

DR. HESS & CLARK, Ashland, Ohio.

Also Mfgrs. of Dr. Hess Poultry Pan-a-ce-a and Dr. Hess Healing Powder.

Dr. Hess Stock Book Free.—A complete treatise on stock and poultry disease, written by Dr. Hess (M. D., D. V. S.), and sent free, postage paid, if you will write Dr. Hess & Clark, Ashland, Ohio, and say what stock you have—how many head of each kind; what stock food you have fed, and mention this paper. Prof. W. S. Goss, Dean of Talladega (Ala.) College, says of it: "I think Dr. Hess' Book a little gem. I shall keep it near me for reference."

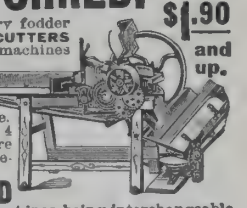
Instant Louse Killer Kills Lice.

ARMOUR'S BLOOD MEAL

Cures Scours in Calves.

First proved by the Kansas Agricultural Experiment Station, and since corroborated by thousands of leading stockmen who have used it without a single failure. Equally effective for the diarrhea of all animals.

PREVENTS weak bones, paralysis of the hind legs and "thumps" in pigs; "big head" of foals; "rickets" of all young animals; abortion due to incomplete nutrition, and a host of other troubles.



A Potent Food for Work Horses, Dairy Cows, Poultry.

Write us for booklet giving valuable information about **Blood Meal** and our other feeding products. Consult us free of charge regarding stock diseases.

THE ARMOUR FERTILIZER WORKS,

Chicago. Omaha. Baltimore. Atlanta. Jacksonville.

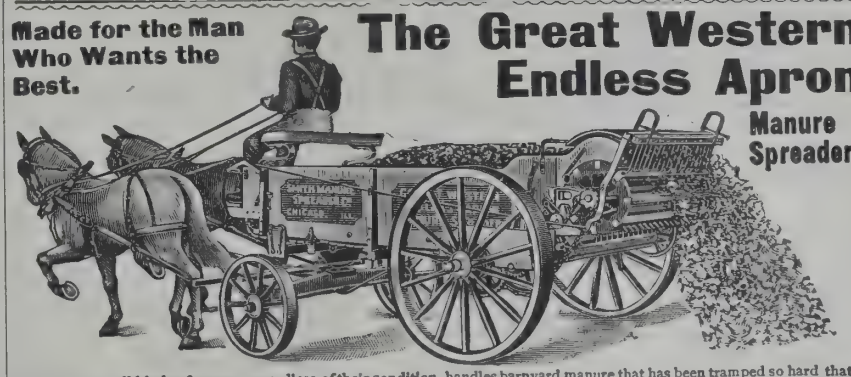
CUT AND SHRED. PRICE $1.90 and up.

all kinds of green and dry fodder with the **WOLVERINE CUTTERS AND SHREDDERS.** No machines of this kind have ever been made which will do more good work with less power than these. They have knives with 4 cutting edges—a measure of economy. We have devised a special

SHREDDER HEAD

which fits any of these machines, being interchangeable with the same size of knife head. It makes two complete machines out of one. Each machine is equipped with a safety fly-wheel which insures the machine against breakage. Equipped with safety stop feed lever which insures the feeder against accident.

SWIVEL CARRIERS which will deliver the feed straight away or to right or left, can be supplied with these cutters in any length desired. Our large sized machines are made with or without traveling feed tables. Cuts ¾ to 1½ inches long.



58 STYLES AND SIZES. We have these machines in all these styles and sizes and can supply anything which anybody could possibly want. They range in price from $1.90 up. Our largest machine will cut a ton of feed in 5 minutes. Every machine is guaranteed as to quality of material, workmanship, capacity and quality of work.

CUT THIS AD OUT and send it to us and we will mail you our **free** feed cutter and farm machinery catalogue. It gives lowest prices on all kinds of improved machinery.

MARVIN SMITH CO. CHICAGO.

Made for the Man Who Wants the Best.

The Great Western Endless Apron Manure Spreader.

SPREADS all kinds of manure regardless of their condition, handles barnyard manure that has been tramped so hard that it is necessary to loosen with pick, fresh stable manure, containing wet or dry straw, corn stalks, etc. Old straw stack bottoms, whether rotted or not. Cow manure fresh from the gutter, sheep manure, lime, salt, ashes, and in fact all kinds of manure and fertilizers and does it quicker, better and more evenly than by hand. Spreads as much manure in one day as 15 men can by hand. Spreads the largest load in 2 to 4 minutes. Makes the same amount of manure go three times as far and produce better results. **NON-BUNCHABLE RAKE** which forms a hopper and holds all hard chunks of manure in contact with beater until thoroughly pulverized before discharging, therefore no bunching or uneven work. The **ENDLESS APRON** is one continuous apron (Not a ½ apron) and therefore is always ready to load, no turning back into position with crank or reverse gears to cause breakage. Apron does not extend below axle. The Combined **HOOD AND END GATE** keeps manure away from beater while loading, prevents choking of beater when starting and acts as a hood and wind shield in spreading. Starts the manure in the right direction, therefore spreads more evenly. **It has a graduating lever and can be regulated to spread thick or thin 8 to 25 loads per acre while in motion. It catches the poor spots with a double dose. LIGHT DRAFT** 1st. Because the load is nearly equally balanced on front and rear wheels. 2nd. The team is as near load as it can work. 3rd. Front and rear axles are same length and wheels track. 4th. Beater shaft runs **in a ball and socket bearing,** therefore no friction. **Beater** is 23 inches in diameter. Has a shipper that **positively** throws machine into and out of gear and holds it there. Our machine is **STRENGTH AND DURABILITY.** Seat turns over when loading. Machine turns in its own length. made so strong that it is almost impossible to break it. Every piece is made extra strong regardless of cost. Every gear and sprocket wheel is keyed on. We use no pins or cheap contrivance to come loose, get out of order, break and cause trouble. **GUARANTEE.** Should any part break, wear out, or get out of order within one year, we replace free of charge. **LARGE CATALOGUE.** 10 by 13 inches, with 8 large cuts shows spreader perfectly and describes it fully. Gives 34 reasons why the **Great Western Endless Apron Manure Spreader** is the best and most complete machine made and why you should have one. Also tells how to apply manure to secure best results. **Mailed free.**

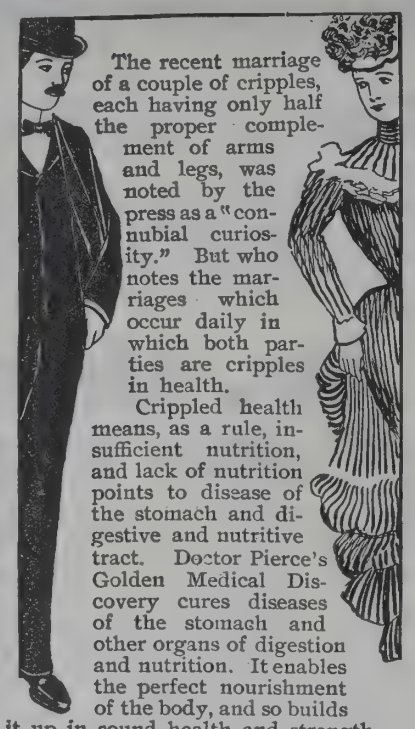
profitable, as it will do much to assist in placing our standard of production on the same high plane as, or above, that of older competitors.

Indisputably, Kansas affords unexcelled advantages and possibilities in the dairy business to those who most intelligently respond to opportunity's invitation. Cows of higher grade, if not pure-bloods, educated, practical dairymen and creamerymen, co-operating, applying skill and modern methods to their undertaking, with the aid of new and impoved machinery, will serve to create within her borders a dairy industry that will long survive and permanently prosper.

It is to be regretted that we are behind the more progressive states in having no dairy commissioner, inspectors, or adequate pure-food laws. There is need for these, and the industry is of a magnitude to entitle it to such recognition. Favorable environments make the dairy conditions here, on the whole, as nearly perfect as are to be found, but human nature is the same everywhere; there is always room for improvement, and Kansas in this respect, as in others, wishes to lead and not follow. In many of the older, successful dairy states the inauguration of such supervision, assuring careful inspection of farm dairies and creameries, with their methods and products, has proven of inestimable value, and has had a most wholesome effect.

Abortion in the Dairy.

ED. HOARD'S DAIRYMAN:—For quite a good many years this disease has prevailed to a greater or less extent in my own county, Franklin, Vt., as well as in some other parts of the state. It has been the source of a good deal of annoyance and loss to the farmers in whose herds it has from time to time made its appearance.



It has acted strangely in its conduct—that is, when it gets into a dairy, it seems as if it were contagious and will usually go through the herd; while when once in the neighborhood it does not show an epidemic character, or that it can be easily transmitted from one farm to another, and that perhaps adjoining. Years ago, this disease first made its appearance in a herd in an adjoining town, had its run and then became extinct. After an interval of perhaps ten years, it has again broken out on this farm and is running a second course. This is the first case I know where the disease has thus made a second appearance after the lapse of several years. Perhaps in other places this may have been the case.

During the long time since it has been showing its presence and effects in my immediate neighborhood, it has not taken the herds as they came, but here and there one, leaving others immediately adjoining, free. This would seem to indicate that it can be easily transmitted from one herd to another without actual contact.

But the isolated cases are growing less in number, and it is possible that in time the herds will be rare where there have been no cases. A herd near-by that had hitherto remained immune, has, during the past year, suffered terribly from this disease, more than one-half being affected by it, while just across the road there is another farm where there has not as yet been any trouble. In another town, a farmer with a herd of 50 to 60 cows had 35 cases in one season. He had a lot of heifers off in a pasture by themselves, and quite a number of these lost their first calves. Heifers are quite subject to the disease.

It used to be generally supposed that in two or three years the disease would run its course in a herd and then disappear. In some instances this appears to be the case, while in others it will remain for several years, perhaps because in large dairies there are heifers being continually raised for the needs of the farm. It has been in my own herd for two or three years, not so generally as on some farms, but quite sufficient to show its character and effects.

I think its run is about over, for which

The recent marriage of a couple of cripples, each having only half the proper complement of arms and legs, was noted by the press as a "connubial curiosity." But who notes the marriages which occur daily in which both parties are cripples in health.

Crippled health means, as a rule, insufficient nutrition, and lack of nutrition points to disease of the stomach and digestive and nutritive tract. Doctor Pierce's Golden Medical Discovery cures diseases of the stomach and other organs of digestion and nutrition. It enables the perfect nourishment of the body, and so builds it up in sound health and strength.

"I had been a great sufferer from indigestion for the last nine years," writes Mrs. Margaret Stingle, of Owings Mills, Baltimore Co., Md "I was such a wreck it seemed death was near, but to-day can say I feel like another woman. I have received much and lasting good from Dr. Pierce's Golden Medical Discovery and 'Favorite Pescription.' I have taken twenty-five bottles in all, and followed the advice of Dr. R. V. Pierce, and am happy to say that life is worth living now. A thousand thanks for your treatment."

Do not be cajoled into trading a substance for a shadow. Any substitute offered as "just as good" as "Golden Medical Discovery" is a shadow of that medicine. There are cures behind every claim made for the "Discovery."

The Common Sense Medical Adviser, 1008 large pages, in paper covers, is sent *free* on receipt of twenty-one one-cent stamps to pay expense of mailing *only*. Address Dr. R. V. Pierce, Buffalo, N. Y.

The Polk County Land & Loan Company
For Choice Red River Valley Farms. They pay railroad expenses if you buy from them. A few good bargains.

360 acre farm, 4½ miles from Crookston, Minn., a city of 7,000 inhabitants, and 2½ miles from the State Experimental Farm. This is a photograph of the buildings as they are today: House is 16x24 1½ stories with an L 14x22, and a wood shed in connection 20 feet square, all on a brick foundation. Barn 28x48, with a lean to 16x48, sheeted both inside and out. Two granaries, one 14x80, and the other 14x42. The buildings are all well painted and in very good repair, and has a fine artesian well. Every acre of this farm is under a high state of cultivation, and is well drained by a slight ravine running through the farm merely sufficient for self drainage. The soil is a rich, deep black loam with a clay sub-soil, and in every respect is considered to be one of the best farms in that vicinity. Our price on this farm is $35.00 per acre.

This is a **320** acre farm about 2½ miles south of the city, this farm is quite well improved, has a very good house of about seven rooms, 1½ stories, barn large enough for ten head of horses, also a good granary, pasture and an artesian well, also has a good well at the house, good grove around the building. This is a very choice piece of land for the price $32.50.

160 acres north-east of the city; this is all hay land, and located in a German settlement, the surrounding country is nearly all under cultivation; we consider this a good piece of land for an investment, this could all be put under the plow, if desired. Price $19.00 per acre.

GROOM YOUR CATTLE BY POWER

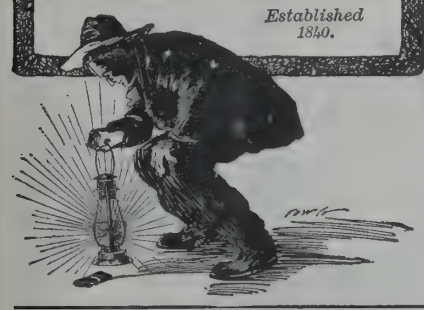
You Will Find



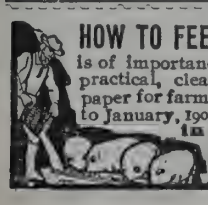
for every character of night work when you are moving about no light so satisfactory as

Dietz Cold Blast Lanterns.

They don't blow out. They give you a strong, clear, steady, white light. They are absolutely safe. They are models of convenience. Don't confound them with the common lanterns you can buy. No other approaches the Dietz. Most dealers sell them. Write for our lantern book and make your choice from it before you go to buy.

R. E. DIETZ COMPANY, 94 Laight St., New York

Established 1840.



MOST HEAT=LEAST FUEL

Largest firebox. Least expense and trouble. Burns wood, cobs, straw, etc. Jacket and bottom of heavy galvanized iron (double rivited.) Two heavy cast iron plates 8 inches apart compose the double top (our patent.) This double top space connects with manhole and smoke-stack, forming dead air compartment and keeping fire below water surface which saves the heat.

We have a valuable book called "Warm the Water and Save the Feed," which we will send you FREE. It's worth $1.00.

WINONA TANK HEATER
is unconditionally the best heater made. Price $6.50. We pay the freight. Address
WINONA TANK HEATER CO., 82-2ND ST. WINONA, MINN.

HOW TO FEED AND BREED HOGS
is of importance to swine growers. A practical, clean, common-sense swine paper for farmers can be had from now to January, 1905, by sending **10 Cents in Silver** at once to

BLOODED STOCK, Oxford, Pa.

we shall feel greatly relieved. Its effects in a dairy are very bad indeed according to our own and other's experience in the matter.

A small portion of the cows or heifers aborting are a total loss to the dairy as they cannot be brought to the successful stage for milking, and quite a per cent more do not amount to more than an ordinary farrow cow. Now and then one will do very well, and the nearer they come to their full time before calving, usually the better they will do, but the larger part are much injured for milking purposes or ruined entirely for the dairy.

Another serious difficulty we find is getting these cows in calf again, one-half I think proving a failure in this respect.

And in connection with this matter, I would add that we also have considerable difficulty in breeding some of the cows that are apparently all right, not having miscarried. This is a serious matter, as these cows are among our best and the value of the dairy suffers in consequence. The cows are Jerseys or grades, and we have always, since using this breed, had more or less difficulty in this direction. Some think this failure to breed in such cases as I have stated, is in some way connected in its characteristics with abortion, but we were troubled in this way to some extent before we knew anything about abortion as a disease.

One spring we tried a remedy for non-breeding cows, and it worked well with two, but the next year it had no effect on such cows or those that had lost their calves.

It has been said that the same cows would not suffer from this disease a second time, but that is not always the case, as has been found. It would be a relief certainly if something more of the nature of this disease so afflicting to our dairies, could be made plain to our farmers, and if there could be found an effective remedy for the same. Perhaps in time this will be the case.

In a visit to Grand Isle Co., this state, situated in Lake Champlain, I found on inquiry that there was no trouble of this kind as yet among their herds. This is a little singular, but possibly the immunity may be owing in a measure to the isolated condition of these islands, being surrounded by water. At any rate, the farmers should consider themselves fortunate in thus far escaping this infliction, which has been and still continues to be, such a serious drawback to the dairy interests of our country. E. R. TOWLE.

Franklin Co., Vt.

New Hampshire Dairy School.

The Ninth Annual Dairy School of the New Hampshire College of Agriculture and the Mechanic Arts will open on Tuesday, January 5th, and continue ten weeks, closing on March 15th.

The object of this school will be to furnish a broad and substantial foundation for those who would become successful as creamery managers or dairy farmers. In other words, it offers a short route to a successful career which otherwise must require years of experience to attain. All available space in the Dairy Building will be occupied by the various forms of separators, and other dairy appliances, which will be for the use of dairy students.

The subjects considered are those which have a practical bearing on everyday affairs connected with the various branches of the dairy industry, and will include a study of the conditions covering the production of milk, and the manufacturing of milk into other products, milk testing, dairy bacteriology, the chemistry of milk and butter, and the use of dairy machinery. The subject of the dairy farm will also be considered, and will include the study of the breeds of dairy cattle, their care and management, and a discussion of the more common diseases, their causes and the methods of treatment. Especial attention will be given to the subject of feeds and feeding; a careful study will be made of the different dairy feeds and their value in a feeding ration. Practice will also be given in computing and compounding rations for dairy animals.

No entrance examination is required and there is no age limit for students. A tuition fee of five dollars is payable at the beginning of the term. Other expenses, including books, room and board for ten weeks, will amount to from between fifty to sixty dollars. For further information and description, address New Hampshire College of Agriculture and the Mechanic Arts, Durham, New Hampshire.

Hey! Santa, where's that

STEVENS

Don't disappoint the boy at Christmas-time—buy him a rifle or shotgun and teach him how to use it properly. Tempt him to a fresh-air life. Let him feel the wholesome influence of the finest sport in the world. Train his eye and steady his hand before a target or make his blood run faster in the hunt for game.

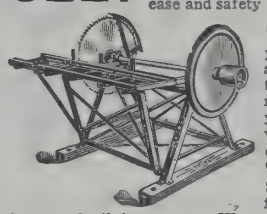
SEND FOR OUR FREE BOOK OF 128 PAGES

It tells about the "Stevens," gives pictures and prices. Contains articles on Hunting, Fishing, Canoeing, Target Shooting, etc.

Send 4c. in stamps for a teasing RIFLE PUZZLE. It is lots of fun—"easy when you know how," but everyone can't solve it. Can you? Address Puzzle Dept.

We make Rifles, Shotguns, Pistols, from $2.50 to $150.00. Most good dealers will sell you a "Stevens"—some will try to talk you into taking a poor kind because they can make more money on them. Look out! A gun is the safest thing in the world if *well made*, but a poor gun is a good thing to leave alone.

We make a specialty of these Rifles:



"Stevens-Maynard, Jr." $3.00
"Crack Shot" $4.00
"Favorite" No. 17, $6.00

We will sell to you direct (and pay the express charges) if your dealer won't supply the "Stevens"

T. PHILLIPS, Box 13. Pomeroy, Pa.

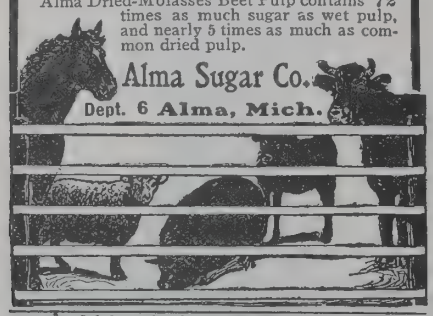
Time to Eat

finds your stock ready to eat if you feed them the genuine

Alma Dried-Molasses BEET PULP

It is not refuse matter but is a by-product food of greatest value, made with the same cleanliness and accuracy as the sugar itself.

We have a booklet telling how this food is made. Ask for one; it will interest you.



It is superior to the many patented "stock foods" as it is a natural product and contains no drugs or dangerous ingredients.

Better than bran and costs less. Keeps the animals in prime condition and when fed with grain is the best fattener known because it improves both appetite and digestion.

E. C. Cummings, Carson City, Mich., writes: "Send 2 tons first freight. Am feeding 35 steers to top the market. This is my 6th order."

It is the best food for milch cows; splendid for calves. All stock thrive on it.

Do not confuse this with wet beet pulp which freezes and ferments, or with common dried pulp containing no additional sugar. It takes 16 tons of wet pulp to make one ton of our Food, and it keeps indefinitely. The genuine Alma Dried-Molasses Beet Pulp contains 72 times as much sugar as wet pulp, and nearly 5 times as much as common dried pulp.

Alma Sugar Co.

Educate the Hired Man.

ED. HOARD'S DAIRYMAN:—How plainly the writer of the above lines, signing himself as "Ex Hired Man", shows his own failings. He says he gets $20 a month or at the most $25. What does that mean? At the very least from $30 to $40 when he counts in his board, and this does not count in the wear and tear to his employer, and I can assure him that 25 per cent of the average farm hands to be had to day are the gump heads, he so kindly calls them, and I am very much afraid he is one of them.

In almost every walk in life a man is snpposed to educate himself for the business he intends to follow, but there are a great many men who think a man does not need an education to be a farmer and as a result that class of men never get much farther than the man who styles himself a gump head.

There are a great many men in this world like a man we ran upon in a New York store, caught in a pouring rain, without an umbrella. We stepped into the first open door we came to, which happened to be a gentleman's furnishing store; hats, umbrellas, and such things. A dapper young fellow came up and asked our wants; we informed him we wanted the rain to stop more than anything else just then. During the few minutes we were standing there, he informed us that he was really the man who made the store a success. The firm was of course of no consequence. If he had not been the man he was they would not have amounted to anything. But the height of his ambition was to be a farmer, to manage some large farm. We simply inquired if he knew anything about farming? Why no, but that was nothing to learn, a man who had been the success he had, could certainly succeed. But we have never recommended him yet. We are very much afraid he could be classed with the gump head variety.

But as to the money end, there is no business that one can begin without capital, with good, sound common sense and a willingness to try, that will, properly cared for, put by more money than being a good hired man.

Three brothers came to this country in debt for their passage. Each one of them worked in turn eight years for the same farmer. Their average for the eight years was about $170 a year and board. Two of them, at the end of the eight years, had over $1,000 in capital, rented farms and are both doing well. The third worked ten years, invested in a farm at $80 per acre and is paying for it. These men when they came to Wisconsin, were totally ignorant of farm work as done in this country, but they knew they were ignorant and were ready to learn. It makes no difference if on a farm or store, railroad or shops, it makes no difference what his wages, whether great or small. If he wants to be out every night of the week he cannot do justice to his work, and he cannot save his wages, and he can blame no living man but himself for being a gump head.

ONE OF THE FARMERS.

Wis.

A simple and proper method of cleaning costly and easily-injured articles is to make a suds of hot water and Ivory Soap, and allow it to cool until lukewarm. This solution, while very effective, is perfectly harmless.

Ivory Soap contains no alkali. It will not destroy the surface or texture of any material, however delicate.

Ivory Soap differs from other soaps. It is more carefully made, and the materials used in its manufacture are the purest and best.

IT FLOATS.

PROFIT AND PROTECTION
THROUGH ELMCO FEED

Had you the time and facilities to analyze all the feed you use, it might be safe for you to buy in bulk. But you haven't and to buy bulk feed without applying chemical test, is like buying a horse on his looks.

Feed may look all right but be light in nutrition or heavily adulterated. Twenty-five per cent of seventy-eight samples of bulk feed analyzed by the Massachusetts Experiment Station showed serious adulteration. Ground corn cobs, coffee bean hulls and other purely fibrous substances were discovered.

The feeders protection against such fraud, is the purchase of feeds which have been analyzed by the Agricultural Experiment Station and are packed in sacks, bearing the trade mark of some responsible miller who guarantees the quality, strength and weight of the feeds contained in the sacks.

ELMCO Feeds have been analyzed by the Wisconsin Experiment Station and found to be pure, unadulterated and profitable feeds for milk or fattening. They are not patented or medicated stock foods, but hard Spring wheat feeds, carefully milled for best feeding results, packed in the ordinary sized sacks, branded with our copy-righted trade mark, "ELMCO" which guarantees weight, purity and uniform quality of the feeds.

We should like to correspond with a few more large feeders with a view to furnishing them ELMCO Feeds direct from the Mill. Prices and samples sent upon request. Ask your Banker as to our responsibility.

Twenty-five cents per line, (agate measure) 14 lines per inch, each insertion.

Entered at Fort Atkinson, Wisconsin, as second-class matter.

Erecting a Silo.

ED. HOARD'S DAIRYMAN:—Picture No. 1 shows our method of putting up a 2×6 stave silo. The door frames are made of 4×6, well bolted together with 2×6 cross pieces to hold them apart. It is put in place and thoroughly braced. And then a 4×6 is placed one-third of the way from the door and it is braced also, and then a hoop of the right length is put in the top holes as shown in cut. And now every thing is ready for the staves, one man on the ladder at top and one on the ground. The staves are braced from the back side at times.

Picture No. 2 shows silo one-third up, also the other 4×6 in place with rod. Mr. F. M. Parsons is on top of post.

Picture No. 3 shows the way the silo looked at six o'clock the first day. The rest of the hoops were put on the second day.

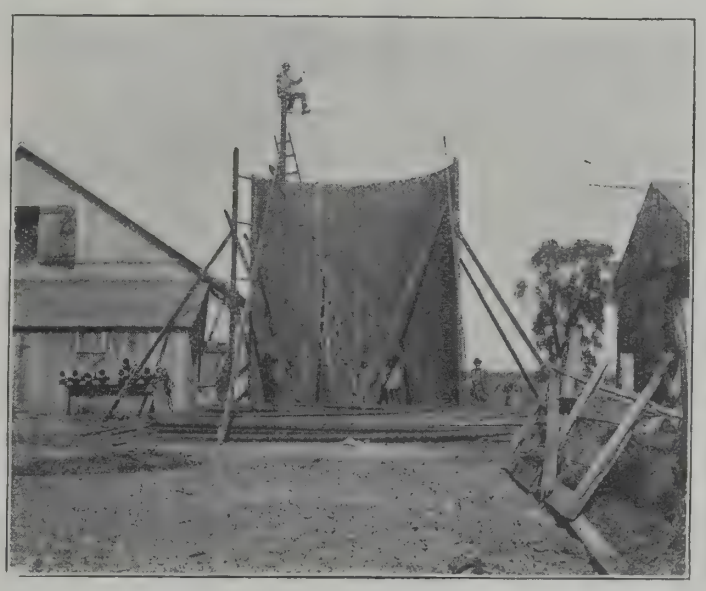
We had 1,100 tons of ensilage to cut this fall in the neighborhood. We used a Ross ensilage cutter. N. H. C.

Burlington, Ia.

The Farm Help Problem.

ED. HOARD'S DAIRYMAN:—One cause for the scarcity of farm help has recently come to my notice. This is the uncertainty of the pay. It is very discouraging for a man to work hard and then find at the end of a month or season that his employer either cannot or will not pay him his wages. After several such experiences is it strange if the smartest and most intelligent farm hands go into some other kind of work where the pay is sure?

This state of affairs makes it difficult for farmers who do pay their bills to get help. The innocent suffer for the guilty.



There are some farmers who want to pay their men and try hard to do it, but their crops fail, or they are not good managers, so the men have to wait.

There is also a class of dead-beats, and these are more often the ones who take advantage of the unfortunate or aged. I know of one man who runs a large city milk route and does not calculate to pay any of his men if he can possibly help it. He holds them off with promises and excuses till they are utterly discouraged and leave him—perhaps to be cheated the same way at the next place. One old man I know of worked all one winter on the understanding that he was to get twenty-five cents a week in addition to his board, and did not even get that small sum. He was old and deaf, but he was temperate and moral and a good worker. Another younger man, an exceptionally honest and faithful hand, was cheated in a similar way. I know of other such cases. These men are not perhaps the most intelligent class of farm help, and would not command the highest wages, but are honest and trustworthy, and a farmer would feel safe in taking them into his family.

It seems to me that if farmers would plan more carefully and make it a rule to pay their men promptly at the end of every week, they would more easily obtain good help. Most men would be satisfied with smaller wages if the money came surely and promptly.

Abington, Mass. S. B. R.

Erecting a Silo on the Farm of H. N. COBB, Burlington, Ia.

The Farmer as a Factor in Creamery Butter Production.

This is the farmer's part in the production of good creamery butter:

1. Keeping a sufficient number of cows to make it well worth while to provide for them the kind of feeds and give them the care they should have.

2. The cows must be of a recognized milk-producing type. A cow that does not yield 200 pounds of butter fat during one year's period of lactation can seldom be kept at a profit. The best dairy herds now produce over 300 pounds per cow per year, and already some have set even a much higher mark.

3. The cows must have an ample supply of nourishing and palatable food both summer and winter, and of course plenty of pure water. For a palatable and nourishing food for winter use, there is nothing better than corn ensilage.

4. Fully as important as any other of the many requirements in profitable dairy farming is the care given the milk.

Good milk—good buttermaker—good butter. Here is a trinity that stands all powerful between the dairy farmer and his profit—the willing dollars of the butter consumer. Good butter—good buttermaker—good milk—a trinity one and inseparable, and the farmer is the beginning and the ending. His part is to furnish the good milk—the alpha and omega of getting a fancy butter product, which again means a good market demand and price and a goodly share of honest profit dollars in the pocket of the owners of the cows.

The necessity for producing good milk cannot be too strongly impressed on all who have the handling of it. Though many suggestions may be found of great practical utility by the patron, such as prompt removal from the milking stalls, rapid cooling in tanks of water to drive out quickly the animal heat, clean washing of cans followed by exposure of them to sun and air, etc., one general law, well observed, will suffice.

Aim to deliver the milk at the weighing room of the creamery as clean, as pure and as sweet as though every drop of it was to be used on your own table!

Can dirty milk, unstrained, turning sour, smothered, tainted from stable exposure or otherwise, or carried in ill-smelling cans, ever reach the weigh-can of the creamery under that rule?

Whether operated by an association of farmer shareholders, by a stock company, by a corporation located in a distant city, or by a locally resident owner, the creamery is ever a co-operative institution. No one patron can deliver milk below grade and flatter himself that because it passed the receiver he is thereby the gainer. It is true he has gained temporarily what is lost by his more careful neighbors, for he has lowered the quality of their product to his own level, but it is not written that a man shall continue to prosper at the expense of others indefinitely.

Let every milk can stand on its own bottom. Let every patron feel that in the chain of association for the production of good butter he forms no weak link, but equally with his neighbors stand steadfast and true, giving his best and asking equal worth of every other. The organization is not perfect if any part is weak or wanting, and thus the milk producer must do his full share toward the attainment of that perfect result—a market for the highest grade butter, through a well managed creamery well patronized by well satisfied, intelligent patrons.

Do what the buttermaker may, the purity of the butter will never rise above the purity of its source, therefore the better the milk the better the butter. Every hour, every minute the milk is exposed in stables, barns, or other surroundings laden with flavor-destroying taints or exposed at temperatures above 60 degrees, its quality is impaired for the making of the best grade of butter. Every time it is closed tightly into the creamery can while warm, or the warm morning's milk is poured into the cold milk of the evening before, it means a loss of butter quality because of "smothered" milk. Every exposure of the cans to the hot sun of summer, while the milk is on the way to the creamery, means a lessening of that fine delicate taste that is to butter what the fine edge produced by honing is to the axe or other sharp cutting tool. It is not in nature that the stream shall rise above its source—neither may it be that butter shall be better than the milk that it is made from.

Something can be done, it is true, in the creamery to overcome provious neglect of the milk, through the cleaning process of centrifugal cream separation and through the use of heat to stop further deterioration, as cooking will check for a time the spoiling of food. But neither of these processes will restore a tenth part of the fine flavor the milk has lost through neglect of the simplest precautions against absorption of taints and the keeping of it at a properly low temperature.

There can be no good butter if the farmer has not done his part to produce good milk and if the butter maker has not done his part to handle that milk in a skillful manner to concentrate its good qualities into the finished product.—JOSEPH KOLARIK, in *Creamery Patrons' Handbook.*

A Banner Potato Crop.

ED. HOARD'S DAIRYMAN:—Knowing that nearly all dairymen are somewhat interested in potato culture, I thought I would give a synopsis of what we call in this country, a banner potato crop.

My neighbor, P. B. Daley, has harvested this season from seventy acres of land, 15,200 bushels of market potatoes. They were loaded on three canal boats, holding a little over 5,000 bushels each—the boats being used for transportation to New York and as storehouses after the arrival.

Mr. Daley says the system of produc-

ing such a wonderful crop on so large an area is no secret. The first great requsite was a favorable season. The next was fertile soil, but he lay no great stress on intensive culture.

Thirty-five acres of this land have been planted to potatoes for 40 years consectively, and some of it longer, and on that land he got the largest yields.

The kinds of potatoes planted were Early Rose, Hebrons, and Peerless or Sixes. The Early Rose, as a rule, is considered a light yielder, but Mr. Daley harvested 1,000 bushels from one three-acre piece, and from another three-acre plat, 1,050 bushels of Peerless, and from ten acres of the same, 3,150 bushels. The potatoes are all weighed and 65 pounds allowed per bushel.

The natural soil was a cold, sour, swamp land that in its natural state will produce nothing but white birch and tag alder bushes of a feeble growth, but when cleared up and drained and fertilized, seems almost inexhaustible for potato culture. The system followed is to cover a piece one year with stable manure (horse manure being preferable), and the next year use a high-grade potato fertilizer at the average of about 500 pounds per acre. Plant in rows 2 feet, 10 inches each way and do as little cultivating as possible and keep the weeds and grass down. That must be done at all hazards, and when the tops nearly or quite shade the ground, hill them in good shape with the hoe and wait developments.

We open our boats about the middle of January and wholesale them from the boat. The early varieties are sold to the Long Island farmers for seed and the late varieties are shipped to Cuba. They all go for seed as they are not first-class for table use, but have excellent keeping qualities and always sell a little above the market. F. S.

Sandy Hill, New York.

The Oleo Question in Washington.

Arguments This Week Before Supreme Court of United States on National Oleo Law—Validity of Rulings at Stake.

WASHINGTON, D. C., Nov. 30—The oleomargarine forces are here in Washington with six of the leading attorneys of the country in an effort to overthrow the National Oleomargarine Law Four cases involving the validity of this act are before the Supreme Court of the United States and were set for argument to-day, but the court will probably not reach them before late tomorrow or Wednesday. The decision may be handed down in a month or may hang fire for a year.

The oleomargarine interests are represented by Wm. D. Guthrie of income tax fame, New York city; Miller Outcalt and Chas. E. Prior of Cincinnati, law partner of United States Senator Foraker, Francis J. Kearful, Delovan B. Cole and Chas. C. Carahan, six in all and in addition Kingman & Company of Indianapolis, have sent ex-Attorney General Miller to look after their interests.

The government is represented by the Solictor General whose brief is one of the most able and complete ever filed with the court, and he has been ably assisted in the preparation of the case by Commissioner of Internal Revenue J. W. Yerkes, who is also an able attorney. The Internal Revenue Department will not permit outside counsel in the cases involving taxation, and it is plain from the thoroughness of the government brief, which covers 180 pages, that no assistance is needed. This is considered by the Internal Revenue Department to be a most important case, as it involves the right of the Commissioner to rule regarding the collection of all commodities which Congress has taxed internally. CHAS. Y. KNIGHT

Profit of the Dairy Cow.

Very few farmers realize the income to be had from a good cow. The farmer who keeps a cow a year to raise a $15 or $20 calf usually thinks he has done as well as anyone, but his profits do not compare with those of the dairyman. Except with high-priced registered cattle, as a rule, the milk, not the calf, is the most valuable product of the cow.

The milk produced by the average Missouri cow will sell for about $30 at the creamery or when made into first-class butter. A good cow of the dairy breeds will make at least $50 cash income every year.

I have a list of about fifty Missouri farmers who report a cash income of from $50 to $100 per cow every year, and these figures do not include the income from the calves and pigs fed on the skim milk. But, says one, milking is a tremendous task. As a matter of fact, it takes only sixty hours' time, worth about $6 to milk a cow ten months.

Now, a few facts and figures from our experience on the state farm. Last year the cash income from the herd was $82.50 per cow for butter sold and $12.50 per cow for milk, skim milk and calves, making a total income from each cow of $95. This year the average income from the same source will be over $100 for the entire herd of twenty-eight.

These incomes do not come from feeding expensive feeds or excessive feeding. They are not due to fine barns or unusual treatment of any kind. But they are the result of doing the right thing at the right time in the proper way.—C. H. ECKLES, Professor of Dairy Husbandry, Columbia, Mo.

An Ohio Guernsey Sale.

ED. HOARD'S DAIRYMAN:—The sale of J. R. Austen's small herd of Guernseys was most successful in point of attendance. Many prominent breeders of Ohio were present, including A. R. Potts representing H. B. Van Cleve, Cleveland; Wm. Conley, Cedarville; Joe Defrees, Piqua; Albert French, Levanna; Andrew Sill, Middletown; G. R. Griffin, Lodi; E. L. Benedict, Stantentown; A. R. Collins, Xenia; Earl Stormant, Cedarville; W. Voorhees and Mr. Warder, North Bend.

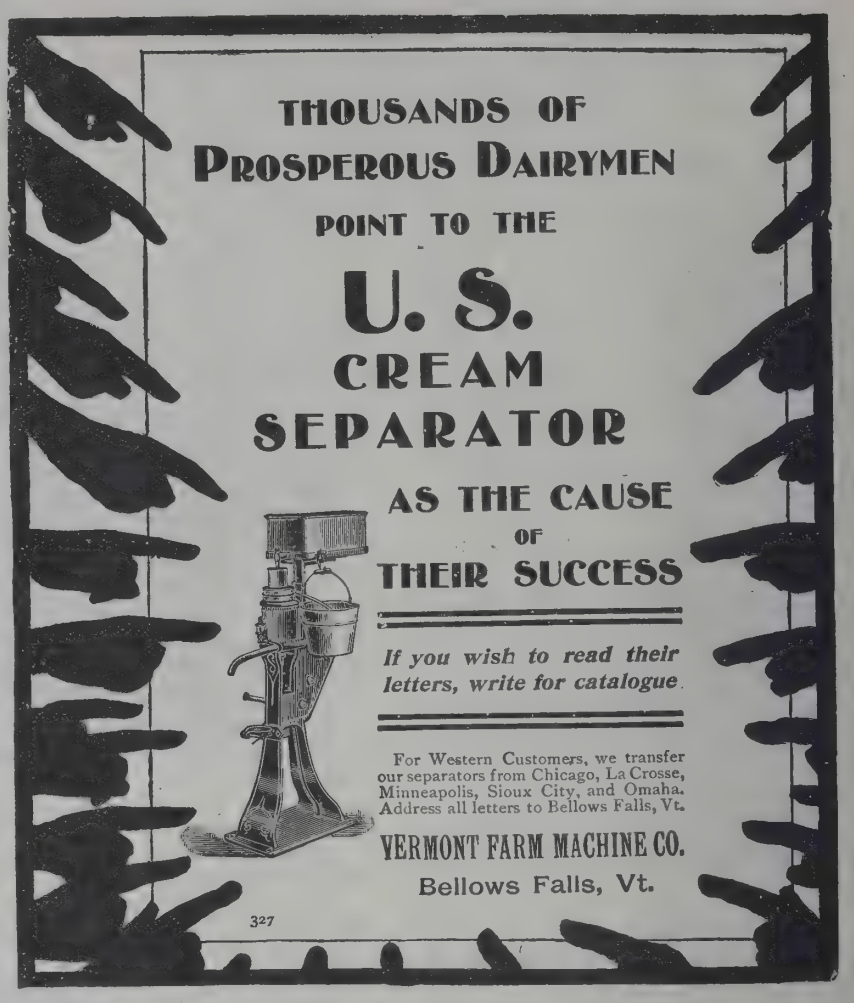
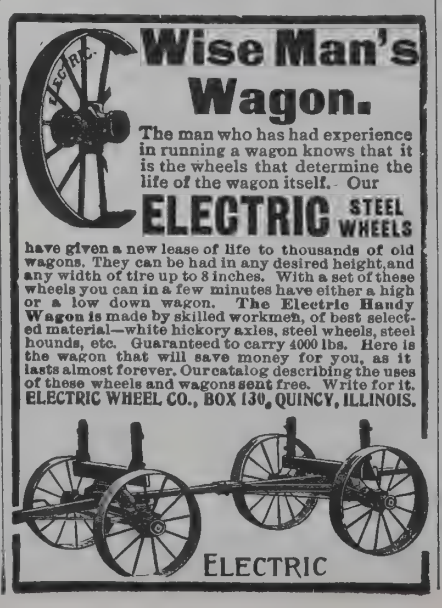
Beet Pulp.



Please advise in your next issue how to feed beet pulp, and which is the most profitable, bran and shorts mixed, say at $13 per ton or beet pulp at $ 2 per ton both delivered at R. R. Station ½ half mile distant.

Beet pulp is being introduced and can be had in abundance at above prices. Publish in your next issue everything that is of interest in the matter as it is a new thing with us. Do so and you will oblige many of your subscribers as well as myself, as I have stated in a gathering that I would write the DAIRYMAN for information and they will be anxiously awating an answer from you. R. L. R.

Spokane Bridge.



If these anxious inquirers will refer to page 772 in the issue of HOARD'S DAIRYMAN for October 9, 1903 they will find a table giving the average amount of digestible nutrients in all the more common American feeding stuffs, including beet pulp.

Beet pulp as it comes from the sugar factory contains practically ninety per cent of water and only ten per cent of dry matter. In one hundred pounds of this pulp there are only 7.9 lbs. of digestible nutrients. In one hundred lbs. of bran there are 58 lbs. or a little more than seven times as much. In one hundred lbs. of middlings there are 82 lbs. or more than 10 times as much as the pulp carries. Under ordinary conditions beet pulp is accounted to have about half the feeding value of good silage, and can be fed up to 50 to 75 lbs. per day.

WHEN YOU SEND IN YOUR RENEWAL speak to a few of your neighbors and have them join you.

Pure Milk in Binghamton, N. Y.

ED. HOARD'S DAIRYMAN:—Binghampton, N. Y., although a city of only about half the size of Albany, is making a more determined effort for the purpose of securing a pure milk supply than do most cities of fifty thousand inhabitants. It so happens that the surrounding country, being decidedly a dairy section, produces practically the amount of milk that is needed for the use of the city. No milk is shipped away, nor is any brought in except by teams. Some butter is made at times when there is a surplus of milk, but not enough to meet the demands of consumers. Consequently, a considerable quantity of butter is purchased from outside.

So long as the supply is so near the place where used, it becomes an easier matter to procure milk of good quality; at least, inspection is easier, as well as enforcement of requirements. Besides, public sentiment appears to demand proper conditions for producing and handling milk, and in reality it is that which determines what the conditions shall be. From what I could learn, the dairymen are, as a rule, as much in favor of right conditions and good milk as are the purchasers, not but what there are many cases of indifference, however, among both classes.

Up to a dozen or fifteen years ago, the milk trade was in the hands of any number of farmers that might happen to care trying the retail business, and even now there are a good many farmers who are engaged both in producing and in retailing.

A few years ago Mr. S. Mills Ely, a prominent wholesale grocer in the city, became interested in a large farm just outside the city limits. He came to the conclusion that an improvement in the milk supply of the city would be welcomed by many purchasers, and might prove profitable as an investment.

He secured the services of an experienced farmer as foreman, Mr. W. Haney, and put the whole matter into his hands. The foreman was instructed to procure cows and equip the farm and the dairy with such an outfit as would best serve the purposes of the business, consistent with economy.

The price of milk was fixed slightly above that charged by the other dealers, it being kept at six cents per quart throughout the year. People were invited to come and see the premises and inspect the methods. The demand for milk from "Honey Bee Farm," as it was called, kept on the increase till finally it was necessary to refuse any additional customers. Upon visiting this farm I found a fine herd of cows. Many are Jersey or Guernsey, though some Holstein and Ayrshire cows are kept there.

The stables are light and airy and are kept clean. Every cow is brushed, and before milking a damp cloth is used in cleaning off dust and dirt. The stable is kept free from manure at milking time, and planer shavings are scattered over the floor and in the gutters.

Each cow has a stall and is kept in by a chain across just behind her. The milk is at once removed from the stable after milking and it is passed through three strainers into cans. A truck conveys it to the milk house. Here it is pasteurized and immediately cooled, and kept in the refrigerator till put on board the delivery wagon.

The milk is liked by customers, is wholesome and keeps, when well cared for, as long as one could wish to keep it.

A few years later Judge Lyon, who is interested in the farm of his boyhood, and in one or two other farms, opened a creamery on one of the principal streets of the city, and in conjunction with a few other people commenced to buy and sell milk, in addition to what they furnish from their own farms. "Clover Dale Creamery" is the name it goes by, and it is one of the prettiest little concerns that I have visited. It has sanitary conditions that are first-class, and exceptional care is taken to keep everything neat and attractive. The milk is carefully inspected when taken in. No pasteurizing is done for the manager says it is better to cool milk than to heat it.

It is clarified by the centrifugal process, bottled and cooled. This concern now handles a greater quantity of milk than any other in the city. There are three or four smaller creameries that are doing fairly well, and a number of farmers who sell a carefully prepared article. A few farmers might improve their stables to the advantage of themselves and their customers, but the number of those open to any considerable criticism is continually becoming smaller.

Some public meetings have been held in the city under the auspices of the Board of Health, where the subject of a pure milk supply, and its bearings upon life and health, have been calmly discussed. Local papers gave full accounts of these meetings, and the public have had excellent opportunities to become informed both as to proper conditions and the conditions which prevail.

Health Officer Hix is entitled to no small credit for the earnest efforts which he has put forth to bring about what appears, at least on the surface, to be a desirable conditions of affairs. It may not be out of order to suggest that the efforts and accomplishments in this particular direction may have been largely instrumental in teaching the citizens of the place to demand a pure water supply, which is now furnished by the use of a fine filter plant. Binghamton appears to be fortunate respecting supplies of healthful drinkables. H. H. LYON.

Chenango Co., N. Y.

Filling Silo With Shredder.

ED. HOARD'S DAIRYMAN:—I wish to build a silo for next year and wish to know whether I can fill it successfully with my Plano shredder and husker, provided I can put corn and all through the machine. H. S. J.

Anamosa, Ia.

Although we have never tried it, or seen it tried, we feel quite certain that it would not be practicable to attempt to silo shredded fodder. In the first place, it would be difficult to get such material into the silo, unless it was cut as well as shredded, and if this difficulty could be overcome we should fear the shredded fodder would not pack close enough to exclude the air.

A FRENCH chemist has discovered that the purity of milk can be tested by electricity, and the irreverent newspaper man of Chicago sees things as follows:

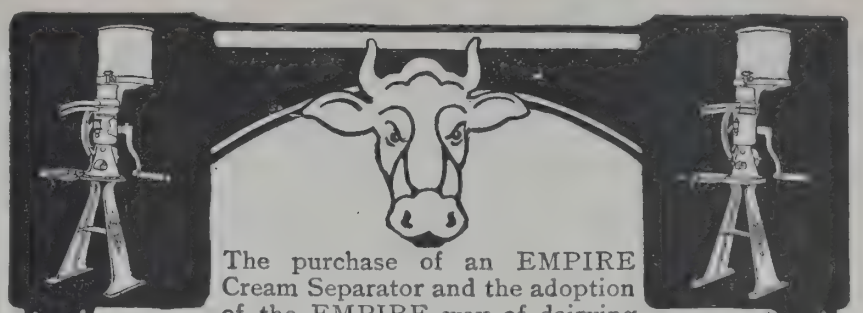
There are always new ways finding
Testing milk.
Each his business busy minding
Testing milk.
Thus we hear from far-off France
That the lightning gets a chance
Human skill there to enhance
Testing milk.
If it's watered they can tell it,
Testing milk,
For the pure stuff they can't sell it,
If the current flows too easy,
It has lost the casein cheesy
And the Paris air gets breezy
Testing milk.
—*Chicago "Daily Produce."*

"ADVERTISEMENT."

ABOUT FEAR

Often Comes From Lack of Right Food.

Napoleon said that the best fed soldiers were his best soldiers, for fear and nervousness come quickly when the stomach is not nourished. Nervous fear is a sure sign that the body is not supplied with the right food.

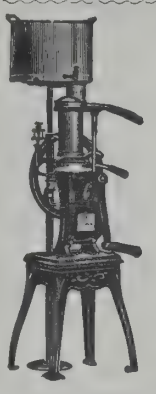


A Connecticut lady says: "For many years I had been a sufferer from indigestion and heart trouble and in almost constant fear of sudden death, the most acute suffering possible. Dieting brought on weakness, emaciation and nervous exhaustion and I was a complete wreck physically and almost a wreck mentally.

"I tried many foods but could not avoid the terrible nausea followed by vomiting that came after eating until I tried Grape-Nuts. This food agreed with my palate and stomach from the start. This was about a year ago. Steadily and surely a change from sickness to health came until now I have no symptoms of dyspepsia and can walk ten miles a day without being greatly fatigued. I have not taken a drop of medicine since I began Grape-Nuts and people say I look many years younger than I really am.

"My poor old sick body has been made over and I feel as though my head has been too. Life is worth living now and I expect to enjoy it for many years to come if I can keep away from bad foods and have Grape-Nuts." Name given by Postum Co., Battle Creek, Mich.

There's a reason.



Look in each package for a copy of the famous little book, "The Road to Wellville."

The purchase of an EMPIRE Cream Separator and the adoption of the EMPIRE way of dairying have marked the turning point with thousands of cow owners. It has shown them in many instances how to make profit from a branch of their business which had hitherto been tolerated as a necessary evil. There are other cream separators, but only one EMPIRE. There are other cream separators with features of advantage, but there are none which possess so many features of advantage as the EMPIRE. There are none from which the features of disadvantage have been so thoroughly eliminated as in the EMPIRE. There are other ways of dairying, but none so profitable as the EMPIRE way. You can learn all about the EMPIRE machine and the EMPIRE way by reading our book. It's free for the asking.

Empire Cream Separator Co.
Bloomfield, New Jersey.
Western Office,
Chicago, Illinois.

EMPIRE

THE
Iowa Dairy Separator.
AN UP-TO-DATE MACHINE
REPLETE WITH PRACTICAL IDEAS

It is built in the following sizes:
250, 350, 450, 600, 750 POUNDS PER HOUR

Our 750 pound per hour machine is a practical Hand Separator. It is as easily run as most separators of 450 pounds and 500 pounds capacity.

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of them read dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own light who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

A NEW BOOK BY DECKER.

The latest claimant for public favor in the form of a book on dairying is from the well known author, teacher and lecturer, Prof. John W. Decker, Professor of Dairying in the Ohio State University. It is a modest volume of 115 pages, and bears the significant title, "Elements of Dairying." In his preface the author tells us that the book is written for the "two-fold purpose; first for those in the class room, and second for the public."

This is a good idea, for the student wishes to have the latest and best expression of what has been learned in dairy truth, and the public wants the same.

We like the book and its simple, clear expression and arrangement of the subject matter.

The following is the division into chapters:

Introductory; The Secretion of Milk; Water and Solids in Milk; Milk Fat; Milk Solids Not Fat; The Physical Properties of Milk; Butter and Cheese; Contamination of Milk; Testing Cows; Market Milk; Dairy Refrigeration; Experiment Station Bulletins; Dairy Literature.

In these several chapters the author has condensed in various sub-heads what he considers the latest and most valuable essentials of dairy information.

The book should be read by every dairy farmer who is striving to secure a compact as well as comprehensive understanding of what this thing we call "dairying" means as a whole, and particularly what it means to him. Price, $1.00, and may be obtained by writing to HOARD'S DAIRYMAN.

EXTRACTS FROM "ELEMENTS OF DAIRYING" BY PROF. JOHN DECKER.

DIFFERENCE BETWEEN MEAN AND AVERAGE.

"Sometimes patrons at creameries take samples from the milk of each of their cows to have them tested. The percentage will be added and the sum divided by the number of cows. The result quite often shows a higher percentage than the average weekly test, and there is trouble ahead for the buttermaker. The result so obtained is not an average, but an arithmetical mean. In securing an average, the weights of milk given by the cows must be taken into consideration, as well as the fat tests.

The following example will explain this. A man has two cows which give milk and test as follows:

	Pounds milk.	*Per cent fat.*	*Pounds fat.*
No. 1	50	3.0	1.50
No. 2	20	5.0	1.00
Total	70		2.50

The arithmetical mean is obtained by adding the percentages and dividing by 2, which gives 4 as the mean.

The average is obtained by dividing 2.5 by 70 and multiplying by 100, which gives 3.57 per cent as the average.

VALUE OF PEDIGREE.

"As an illustration of the value of registered full blood cows over common stock, a record of official tests of Guernsey cows in Wisconsin 1898-1899, published in the Wisconsin Experiment Station Report XVII, is given below:

NAME.	*Registry number.*	*Age.*	*Pounds milk in 1 year.*	*Pounds fat.*	*Per cent fat.*
Lilly Ella	7240	5	12282.68	782.16	6.42
Lillyita	7241	5	12812.73	710 53	5.69
Countess Bishop	7869	4	7387.3	452.23	6.42
Madame Trickesy	6519	6	7024.6	405 19	5.85
Lady Bishop	6518	7	6608.9	381.1	5.40
Pristoun	6570	7	6868.3	355.68	5.19
Nounon	6569	9	6338.0	351.7	5.51

A year's record established in this way may have points for criticism, but is more valuable in estimating the value of an animal than a test for a short period under pressure, as in a seven days' test.

PROF. FARRINGTON'S EXPERIMENTS ON AVERAGES.

"Prof. Farrington has for several years conducted careful tests of cows in the herds of patrons of the creamery at the University of Wisconsin.

Composite samples of all the milk given in a year by the cows were tested once a week.

Samples for single days (two milkings) were taken at different lengths of time apart to determine, as compared with the record of samples of all the milk given by the cows, the accuracy of computing averages when testing and weighing once in seven, ten, fifteen and thirty days. Averaging the results from seven of the most variable cows, the results were as follows:

Once in seven days, gave 98 per cent of the total milk and 98 per cent of total butter fat.

Once in ten days gave 98 per cent of the total milk and 99.4 per cent of the total butter fat.

Once in fifteen days, gave 97.6 per cent of the total milk and 98.5 per cent of the total butter fat.

Once in thirty days gave 96.4 per cent of the total milk and 97 per cent of the total butter fat.

HOW BACTERIA ARE PRODUCED BY UNCLEAN COWS.

"Milk from four dirty cows in a clean barn with clean milkers, gave an average of 90,000 bacteria in each cubic centimeter of milk, while clean cows under the same conditions gave only 2,000, or only one-forty-fifth as many.

In a case where there were twelve cows in a stable, a bacterial count showed the milk of eleven to contain a few bacteria, but the milk of the twelfth one standing next to a pile of dry feed, contained 100,000 per cubic centimeter. Dry feed handled just previous to, or during the time of, milking may furnish bacteria-laden dust.

Raising Alfalfa Seed.—Alfalfa Bacteria.

ED. HOARD'S DAIRYMAN:—The latest reports of the results of the experiments with alfalfa have created a desire to learn how alfalfa seed can be grown on a small plat with a view to get seed for larger experiments. Will you give us your experience in that direction in the DAIRYMAN.

Geo. E. McEathron of Beadle county, South Dakota, gives his experience in the *Record-Herald* as follows:

A tract of land was selected that sloped from what is known as the first rise from the river, or, more properly, it was the top of the river bank, but it never overflows, nor does water stand on it as the drainage is good. The sod was broken deep and twenty pounds of alfalfa seed was sown broadcast, without a nurse crop and harrowed in. The stand was good. It was not cut the first season, but pastured close which did not appear to damage it any. It was protected during the winter with a heavy coat of snow. This season it was cut June 17th with the followfng results:

The lowest part of the tract, which was near the edge of the water, had a heavy growth, estimated at 2½ tons to the acre. This gradually decreased as the distance from the water increased, until on the highest point of land and farthest from the water the yield decreased to an estimated yield of one ton to the acre. Later in the season the yield became more uniform.

In the November number of the monthly journal, *Success*, is an article by Herbert Wallace about extracting nitrogen from the air. In referring to the bacteria the article says:

It has been found that the bacteria common to certain families of legumes will not make their homes on the roots of legumes of other families. For instance, the bacteria that subsist on the roots of alfalfa, will not live on the roots of red clover. The bacteria on red clover, however will inoculate white clover, crimson clover, alsike, buffalo clover and all the rest of the trifolium clovers. The bacteria of bird clover, which is common in some parts of the country, will inoculate alfalfa. The bacteria of soy beans will work on cow peas and similar members of the bean family. CHARLES W. GROTE.

Mauston, Wis.

The editors have never attempted to harvest alfalfa for seed, but they cannot conceive that this would be particularly difficult. Their observation leads to the conviction that it is dangerous, at least in Wisconsin, to pasture alfalfa fields to any considerable extent. Instead of that, the first year's growth should be clipped with a mower, but not close to the ground, and a good growth should be left standing in the fall to protect the plants during our winter and spring, when there is frequently no snow to serve that purpose.

The second year cut the first crop for hay and let the second mature seed, which it will do if there are plenty of bees to effect polinization.

A Pennsylvania Ration.

ED. HOARD'S DAIRYMAN:—Please give give a balanced, economical ration from the following: I have a limited supply of mixed hay (timothy and clover, mostly timothy), oat straw and a liberal supply of corn silage, cut in the early roasting stage. The feed stuffs I have to buy at prices enclosed, adding $1.70 per ton for freight. R. H. D.

Corydon, Pa.

Adding freight, feeds will cost this inquirer as follows: Corn meal, $22.70; gluten, $26.95; corn, $22.45; cracked corn, $22.70; ground oats, $30.70; buckwheat middlings, $26.70; middlings, $26.70; bran, $22.70; oil meal, $29.20; cotton seed meal, $30.70. At these prices and considering the character of the roughage available we should be disposed to select the buckwheat middlings and wheat bran, and use equal amounts (by weight) of each.

For cows weighing in the neighborhood of 1,000 lbs. and yielding 20 to 30 lbs. of 4 per cent milk or better, we recommend for trial as follows:

FORMULA FOR RATION.	*Dry Matter*	*Digestible Nutrients* Protein	Carbohydrates	Ether Extract
40 lbs. silage	8.36	.36	4.52	.28
5 lbs. hay	4.34	.14	2.17	.07
5 lbs. straw	4.54	.06	1.93	.04
4 lbs. buckwheat middlings	3.49	.88	1.34	.22
4 lbs. bran	3 52	.50	1 54	.12
Totals	24.25	1.94	11.50	.73

The silage from such immature corn is not likely to be of highest feeding value, but will likely come up to the figures given, and if it does we can see no reason why cows given proper care should not prove such a ration to be economic. In order to be quite sure on this point we strongly urge the weighing of each cow's milk at every milking and occasional testing of it for butter fat. A record made up in this way will probably disclose a wide variation in the productive capacity of the several cows and indicate that there should be more or less of a corresponding variation in the amount of feed given them. The chances are that there will be few or no cows in the herd requiring more than is specified in the formula, but it will be a very exceptional herd if there are not some cows in it where the grain allowance should be cut down 50 per cent or more. There can be no economical feeding where there is not a regular system of apportioning feed according to the ability of the cow to make profitable use of it from day to day.

Charmante of the Gron's Record.

ED. HOARD'S DAIRYMAN:—Enclosed you will find one dollar for renewal of my subscriptlon to your valuable paper.

I should like to take a few minutes of your time in regard to a statement in issue of Nov. 13th about Guernsey cow, Charmante of the Gron. You said her record is the best of any cow of any breed in the world. I don't intend to dispute it, only a couple of years ago I bought a book called "Dairy Fortunes," and the author claimed to have a cow named Carmena that produced 869½ lbs. of butter in a year. Now was it a real live cow, or did he imagine it, if so, what breed was it? J. F. H.

Buskirks, N. Y.

It always gives us pleasure to receive evidence that whatever is published in HOARD'S DAIRYMAN finds attentive and critical readers. Of course, there is a great difference between the honest, inquisitive critic and the mere quibbling fault-finder, but either one, in any reasonable degree, may be sure of a welcome.

As to the record of this famous Guernsey cow, Charmante of the Gron, and the accompanying statement, it may be noted that the claim was not put quite so broadly as stated by this correspondent, but rather that it was the best officially authenticated, yearly record. What other cows may have done without any official supervision, is not called in question. The public is growing to be more particular and discriminating in the matter of milk and butter records than it was before the invention of the Babcock test, and seems indisposed to yield full credence to claims not accompanied by the corroborating testimony of the test, and at least an occasional checking up by a competent and disinterested witness in extraordinary cases.

We have no other comment to make on the case reported in the book referred to, but it is only fair to state that the claim made for Charmante of the Gron is contested by Mr. Hoxie on page 562, and the record of the Holstein cow, Belle Sarcastic, at the Michigan Agricultural College, is cited as coming practically within the demand for official authentication.

A Letter from Hawaii.

Young Men Anxious to Come to the "States."

ED. HOARD'S DAIRYMAN:—I am a subscriber for your paper. I am not working on a farm, but I am coachman for the manager who owns a little farm. I have been studying the little things about the farm.

There are some very nice young fellows out here that were born and raised on the farm. They can ride, lasso, kill, or take care of well bred cows or wild cows. Some are full blooded natives, some are half white. They have asked me to write to you when I showed them the jobs in your paper and how cheap they could buy a farm on easy payment. They want to know if there are some big dairymen out there that would pay their fare out in that country and give them a job and take it out of their wages. They all talk good English. If there is any such a chance for them, put the answer in your HOARD'S DAIRYMAN and oblige.

L. J. SANBORN.

Olaa Plantation, Hawaii.

In the interest of these young Hawaiians, who are ambitious to learn something of the methods of American dairymen and are willing to work their way up, we publish the above letter and affix the name and address of the writer. It would seem quite possible that some of the dairymen in this country, particularly those on the Pacific Slope, might be disposed to avail themselves of this opportunity to get help on their farms and at the same time give help to some of the young men whose destiny, for better or for worse, is so closely interwoven with our own.

Central Guernsey Breeders' Association.

ED. HOARD'S DAIRYMAN:—The annual meeting of the Central Guernsey Breeders' Association will be held at the Vanderbilt Hotel, Syracuse, New York, Wednesday, Dec. 16, at 2 p. m.

Secretary Wm. H. Caldwell will give an address on "The Guernsey Interests on the Island of Guernsey."

Perry, N. Y G. B. TALLMAN, Secretary.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain sepecific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

Preservatives for Composite Samples.

I would like to know how to keep the milk of each week for a composite test once a month.

Amity, Ore. G. M.

The easiest way to keep composite samples is to use a preservative of some kind. This may be bi-chloride of mercury tablets such as may be obtained from dealers in dairy supplies, or bi-chromate of potash in powdered form, which can be obtained from any drug store. As much bi-chromate as can be held in an empty 22 cartridge case is enough to keep a pint of milk.

What Should Heifer Do?—Relation of Feed to Yield.

How many pounds of milk a day ought a heifer with her first calf give to show promise of becoming a good cow.

How do you apportion a ration to the milk flow? I know how to balance a ration but have no rule for reduction as the cow advances in lactation. Is it practical and wise to make the reduction? Upon what would you feed cows two months before calving? J. L. C.

Elmer, N. J.

This inquirer appears to be asking for specific, mathematical rules, that shall in large measure take the place of personal care and judgment in the management of a dairy herd. It is impossible to give such rules. For example, it happens quite frequently that a very promising heifer will do poorly with first calf, and no satisfactory explanation can be given. Sometimes a heifer will do remarkably well with first calf and fall down completely with second calf. In either case one must take all the circumstances into consideration and not simply the daily yield of milk. If the heifer has a good dairy ancestry behind her, and does not show too much tendency to fatten at the expense of her udder, she should be given a second year's trial, without much regard to how poorly she may have done with first calf. Then again, it should not be forgotten that quantity is not the sole measure of profitable milk giving. Quality is an equally important factor.

Much the same style of answer must be returned to the second inquiry. One cannot feed by set rules, but must be guided by careful observation of results. Cows vary in their ability to make proper use of feed and the personal equation is always present. The only rule that can be given, and this is more a maxim than a rule, is to feed at all times up to the limit of profitable return, prospective as well as present. When the animal begins to convert feed into surplus body fat, the time has arrived to reduce the daily allowance.

The third inquiry may be answered in a general way by saying, give them any kind of wholesome feed and in such amount as to keep them in good condition, being especially careful to see that the bowels move normally free. We are not in favor of starvation rations, unless it be in extreme cases, where the cow has shown some tendency to milk fever.

Poor Churning.

What is the cause of butter not gathering? Am having all kinds of trouble with it, and what the remedy? R. C. S.

Warsaw, Mo.

It is difficult to prescribe for a case of poor churning, when nothing is known regarding conditions, and consequently the most that can be done is to state the conditions that may cause poor churning and allow our correspondent to select the one that seems to apply to his case.

Some of these conditions are the advance of lactation, improper ripening of cream, and low temperature.

The lactation period influences the churning by making the fat globules of higher melting point, and also by increasing the viscosity of the milk serum. Both of these changes influence the churning very decidedly by increasing the resistance offered to the uniting of the fat globules. When cows come fresh in the spring these conditions are observed in the winter months, especially when the food is largely dry, and when large amounts of hay and straw are fed. In such cases much may be done by feeding silage or roots, and in extreme cases diluting the cream with warm water, or sometimes adding dilute salt brine, or perhaps a handful of salt to the cream before churning.

Thin cream is another cause of poor churning; the butter does not separate well, and there is an additional loss from the fat in the extra amount of butter milk. Cream containing 35 per cent fat is easy to work with less loss in the buttermilk.

Low temperature is responsible more than any one thing for poor results in churning. Cold cream froths and swells and there is no separation of butter fat. Under these conditions it is best to allow the cream to stand several hours, and then warm up slowly to the proper churning point before trying to churn again. When the churning stops just short of the breaking point, the trouble may be overcome by adding a little dry salt or a little warm water at 85 to 90° F.

Feeding Corn Stover and Fodder—Stacked Silage—Ground Peas.

I have corn stalks and also considerable sweet corn, ears and all, to feed this winter. My plan is to run them through the cutting box together to get them thoroughly mixed. Is it better to feed this mixture fresh cut to milch cows, or to cut a quantity and allow it to stand a few days and ferment before feeding it?

Would it be a good plan to feed my clover and alfalfa hay alone or to cut and mix it with the corn fodder?

I attempted to stack some sweet corn by putting on a layer of wheat straw between each layer of corn to keep it from heating. The entire stack is now a steaming mass. Will it make good cow feed? At present they seem to relish it.

Do ground peas make a good feed for milch cows, mixed with wheat bran and corn meal? I find the peas give the meal a strong taste.

I should be pleased if you can answer the above questions through the DAIRYMAN. I hope to be able to renew all the subscriptions I sent you a year ago and get some new ones.

Tuscarora, N. Y. S. E. McN.

We prefer to have corn stover and corn fodder cut some days in advance of feeding, and leaving it in a pile to heat and soften.

Feed the hay by itself, otherwise the cows will "nose" over the mixture, select out the clover and alfalfa, and "muss" the corn fodder to such an extent that it will become unpalatable.

Unless the stacked sweet corn gets to a stage where it moulds and decays, there would seem to be no reason why it should not be good feed for cows.

A limited amount of pea meal is considered a valuable addition to a ration, but both it and corn meal are highly concentrated, heavy feeds and should be mixed with something much lighter, such as bran or some quite finely cut or chaffed fodder.

Stable too Warm (?)—Lumber for Silo.

Have bought me a farm and have 10 cows to start with. My cow barn is a lean-to on the north side of the hay barn which is 24x96 ft, and the lean-to is 20x40 ft. Alley in front of the cows is 7 feet; the barn is too warm if the doors are all shut. Can you give me plans to ventilate my barn so it will carry off the foul air?

Have a wall built for a silo next spring; do you think that one thickness of rough boards and two thickness of tar paper and another thickness of rough boards and wooden hoops out side, will be all right? Want to build as cheap as can, or could you suggest a better way?

Bloomer, Wis, C. W. B.

The air in the stable may be foul and oppressive, and thus create the sensations which are attributed to excessive warmth, but is extremely doubtful whether a thermometer hung up in the stable would confirm such a conclusion. But no matter about this, the thing to do without delay is to construct a tight flue, (not less than 17 inches square on the inside, for 10 cows) running from the stable floor to a point higher than the ridge of the barn. Build this flue on the same plan one would build a chimney in order to secure a good draft. That is, avoid sharp turns and angles as much as possible, and see that it is practically air tight from start to finish, except for one full size opening at the bottom, and another at the ceiling of the stable; the latter provided with a slide so that it may be opened or closed at will.

Then, if the stable is too close to admit fresh air, some provision must be made to secure this, for which see page 773.

The plan proposed for constructing the silo would probably prove satisfactory, but the inner course of boards would better be not more than six inches wide and should be planed on the side so as to give a smooth surface next to the silage to facilitate settling. So too, in filling the silo, the settling next to the wall is much aided by keeping the wall wet.

For Some Michigan Jerseys.

Please formulate a ration from the following feeds for Jersey cows, fresh and of average size: silage composed of well eared corn and medium green soy beans (3½ qts. corn, 5 of beans per acre drilled) beans well filled but dropped part of foliage, Shredded corn stover, clover hay, $8 per ton; buckwheat bran and middlings, mixed, $12.50; wheat bran, $20. We have the silage and stover, the others we will have to buy.

Paw Paw, Mich. (MRS.) T. F. P.

Unfortunately there is no satisfactory analysis of mixed corn and soy bean silage. All who have tried it, pronounce it a most satisfactory fodder. Pure soy bean silage is estimated to be nearly twice as valuable as silage from corn, but we incline to the opinion that this is too low an estimate. If the mixed buckwheat bran and middlings is to be fed to these Jersey cows, we should want the bran part re-ground, as the sharp, cutting angles of the hulls would otherwise prove too irritating to the stomach and intestines. If this cannot be done, we should prefer to sift the mixture, feed only the middlings and use the hulls for bedding, where they would prove a valuable addition to the manure. This however would necessitate mixing some wheat bran with the buckwheat middlings.

It follows, from what is said above, that we do not feel competent to give a specific formula, but by way of experiment would suggest trying about 30 lbs. of the silage, 5 to 8 lbs. clover hay, corn stover *ad libitum* and 4 lbs. of pure buckwheat middlings mixed with enough bran, of one or the other kind, to make them palatable, with salt twice daily.

An Illinois Ration.

Kindly formulate us the most economical ration from following feeds: Part of herd are high grade Holsteins and the other part pure bred and grade Jerseys, all fresh in September and October. Bran, $16 per ton; ear corn, 40 cents per bu.; old process linseed meal, $23 per ton, Buffalo gluten feed, $25; for roughage have to limit, cut clover hay and oat straw good, half and half, to 8 lbs. per day; fair corn stover, shredded, to 6 lbs. per day; wheat straw, *ad libitum*. Have the bran and old process linseed meal on hand, but have to buy the other feeds, corn and gluten feed. J. T. D.

Carlye, Ill.

If the price stated for corn means 40 cents for 70 lbs., corn is the cheapest of the feeds named and it would be advisable to use as much of it as each cow will use to good advantage, that is, as much as she could eat without putting on too much body fat. We therefore suggest as follows for an average:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
4 lbs. clover hay	3.39	.27	1.43	.07
4 lbs. oat straw	3 63	.05	1.54	.03
6 lbs. corn stover	2.38	.07	1.30	.03
3 lbs. oil meal	2.72	.88	.98	.21
4 lbs. bran	3.52	.50	1.54	.12
3 lbs. ground corn	2.67	.24	2.00	.13
Totals	18.31	2,01	8.78	.59

Add, of course, wheat straw *ad libitum* and a liberal allowance of salt every day.

Buckwheat Bran and Middlings.

Will you please tell me what effect buckwheat shorts or middlings will have on dairy cows? We can buy this feed much cheaper than wheat bran and shorts. Also please formulate me a ration for our Jerseys. They are all fresh and giving a good flow of milk. We have good clover hay and corn stover for rough feed and can buy buckwheat shorts for $15; wheat bran, $18; wheat shorts, $22; corn and oat chop, $22. We have oats and corn. Would it pay to sell and buy mill feed? J. H. B.

Steamboat Rock, Iowa.

Buckwheat middlings make an excellent feed for milch cows, but on account of pastiness cannot well be used unless mixed with wheat bran or something similar. We speak now of the pure middlings, unmixed with the black, outer covering (bran) of the grain. Buckwheat hulls are about on a par with cotton seed hulls; if anything, inferior. The mixture of the middlings with the hulls is known commercially as buckwheat bran. See table of analyses on page 772.

We should expect very satisfactory results from the following as the average daily allowance:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
12 lbs clover hay	10 12	.82	4.30	.20
8 lbs. corn stover	4.76	.14	2.59	.06
4 lbs. buckwheat middlings	3.49	.88	1.34	.22
2 lbs. wheat bran	1.66	.25	.77	.06
2 lbs. corn and cob meal	1 78	.13	1.26	.07
Totals	21 81	2.22	10.26	.61

A New York Ration.

Please give me a ration from the following feeds: Ensilage, from corn not quite mature, New York dairy feed, dried distillers grains, $23; buckwheat middlings, $15.50; wheat bran, $19; and hay, mostly timothy, a little clover in it, $10. Also a ration of the above without the wheat bran. What is your opinion of this feed and do you think that we can feed winter wheat bran at $19 per ton at a profit selling milk at 2⅝ net. What difference in the feeding value is there between winter wheat bran and spring wheat bran?

Avon, N. Y. M. & P.

If the cows in this herd are now giving but a half mess or less of milk, preparatory to freshening in the spring, as is the case on too many farms in New York, it will not be profitable to feed very much of that high priced grain. On the contrary, if they are winter milkers, not expected to freshen until next fall or early winter, the milk flow must be kept up almost regardless of expense, so that when the cows go to pasture in the spring, they will be in a condition to make good use of the luxuriant grasses of late spring and early summer.

To the latter class of cows, varying amounts to conform to the varying milk giving capacity of the several animals, we recommend a trial of the following:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
40 lbs. silage	8.36	.36	4.52	.28
10 lbs. hay	8.68	.38	4.34	.15
4 lbs. buckwheat middlings	3.49	.88	1.34	.22
4 lbs. bran	3.52	.50	1 54	.12
Totals	24.05	2.16	11.74	.77

Or in lieu of the bran as above, substitute 3 pounds of the dried distillers grains or use some of both.

There is no material difference in the feeding value of bran, whether from spring or winter wheat. As a rule, the lighter the bran, the more valuable it is. Because the corn for silage was not quite as mature as desirable, we have estimated its feeding value much below the customary figures.

A Vermont Feeding Problem.

Please give me the cheapest ration which can be made from the following feeds:

Wheat bran and mixed feed, $1.15; corn meal, $1.15; cotton seed meal, 40% protein, $1.40. I can feed my cows about 25 lbs. of silage (not eared) and all the early cut timothy they will clean up. R. E. B.

Bethel, Vt.

Please read answer to M & P. Avon, N. Y. in this issue. If, as explained there, the cows are expected to freshen in the spring a very different system should be followed from what would be advisable if they are not to freshen again until next fall and winter.

According to a Vermont bulletin, mixed wheat feed, as found in that state in 1900, contains about 12 per cent more available nutriment than average wheat bran, but nothing is said as to its palatability. We therefore specify bran, subject however, to substituting the mixed feed, if our correspondent prefers. In addition to the 25 lbs. of silage, we should expect cows to eat daily 12 to 15 lbs. hay and to keep up the flow of milk, say, 2 lbs. cotton seed meal, 2 lbs. ground corn and 3 to 4 lbs. bran.

Feeding a Milkman's Cows.

I am in the retail milk business with cows coming fresh at all times of the year.

Please formulate me a ration of the following feeds: Corn meal, $22 per ton, wheat bran, $22, gluten feed, $25, oil meal. $28, cotton seed meal, $28, distillers dried grain $28, middlings wheat, 25, middlings buckwheat $22, oats, 35 cents per bushel.

I have clover and timothy hay, corn fodder and a few roots; also oat straw,

Please give me the name of a good book on the care and feeding of dairy cows.

I have been at this business only one year and I wish to learn all I can in regard to it.

Westfield. C. H. S.

No one formula could be given that would be applicable as a guide for feeding a herd of cows coming fresh at all seasons of the year. In fact, feeding by rule is not so much in vogue as it was a few years ago, when almost everybody, who gave the matter thought, was rather blindly following the Wolff standards. Those standards served a good purpose. They set students to thinking and experimenting. The editors of this paper, in the absence of any better light, followed them for some time, but always with a protest and an appeal to our American Experiment Stations for "more light." This has been coming as rapidly as could be expected, but the proper feeding of milch cows is yet very far from being an exact science, and probably never will become such, largely because of the individual equation in each animal.

The cow has been, not inaptly in many respects, compared to the steam boiler, and concerning the latter it is known that a careful, intelligent and attentive fireman will get much more and better service from a given amount of fuel than an indifferent and inattentive one can get, although he may use—or shall we say, waste—fifty per cent more fuel.

If such differences occur with an insensate, man-made, iron apparatus, what may not be expected from the delicately sensitive and intelligent, warm-blooded milch cow. She must have kindly sympathetic care and attention, must be fed with reason and judgment brought into requisition every day, with amounts graduated according to her health and the amount and quality of the work expected of her.

For these and other reasons which might be given, a satisfactory book on the care and feeding of dairy cows—and especially the feeding—remains to be written. Possibly as satisfying a publication as any, at the present time, is Mr. N. B. White's "Thirty Years Among Cows" to be had from this office for $.50. Professor Henry's book, "Feeds and Feeding" price $2.00 is still a standard work and without a rival.

From the feeds named, we should be inclined to choose buckwheat middlings, distillers dried grains (if of prime quality) and gluten feeds. Give the cows what hay and corn fodder they will eat without waste, and supplement this with a mixture of any two or all three of the above feeds in such amount to each cow as she will eat and use for making milk, instead of adding to her live weight. For some cows this amount may reach 8 lbs. or more, and for others 4 lbs. or less will be all sufficient.

Oil Meal for Swine.

How is old process oil meal for fatting hogs and pigs? Our milk goes to milk station, so we have no whey or skim milk. We feed 10 pigs 3 months old, 3 lbs. of oil meal a day. Mix it thin with cold water from one feeding time to next, then turn on boiling water to thin it thin enough to drink. We give ground oats and corn meal equal parts by weight all they will eat. They are growing fine apparently.

Oil meal costs $26.35 per ton delivered, and corn meal $25. Oats same as corn.

What we want to know is if this is the most economical way to feed.

Would ask a few questions in regard to my ration for cows, but will wait till some other time for fear this will use too much of your valuable space. W. H. J.

So. Hammond, N. Y.

At the present (Chicago) prices for hogs it is very doubtful if there can be much profit in feeding them, even in the best portions of the corn belt. These 3-months-old pigs should weigh now approximately 50 lbs., and it will require nearly 4 lbs. of grain to make one pound of gain in live weight. These 4 lbs. of grain will cost five cents at the prices named. The method of feeding described is as good as anything we could suggest under the conditions set forth.

A Maine Feeding Problem.

Please advise me as to the best rations to feed my cows from the following feeds at the prices stated. I am selling milk at wholesale and want all the milk I can, and still have it good. My cows are in all stages of lactation. Corn meal $24; Biles distillery grains, $29; wheat middlings, $27; bran, $24; gluten meal, $30.40, cotton seed meal, $30; linseed meal, $30. My hay is very poor, being late cut June grass; some oat and pea hay that I will feed later on; have no ensilage; have about 300 bushels of carrots and potatoes that I intended to feed my hogs. Will it pay to feed them to the cows and buy grain for the hogs? J. T. M.

La Grange, Me.

We incline to the opinion that it would be advisable to reserve the carrots and potatoes for the cows and especially for the fresh milkers, feeding very moderately of the potatoes, certainly not more than 10 to 15 lbs. per day. In cases of this kind particular attention must be given to the cows that have recently freshened to insure against abnormal shrinkage, and to this end, if possible do not put off using that oat and pea hay for them. One cannot expect to increase the flow of milk after a shrinkage is well established. Neither can the quality of milk be varied by feed.

As it is manifestly impossible to give a formula that will fit cows in all stages of lactation, the best we can do is to suggest that each individual cow be given what hay she will eat with relish and not any more. Compel her to eat practically every spear of the hay that is in any way fit to be eaten. In other words, do not put more hay before her than she will eat, no matter what may be its quality.

For concentrates, the distillers grains are probably as good and as cheap as any of the feeds named, although it may be advisable to use something else to give variety, and possibly some of the linseed oil meal to keep the bowels in good condition.

We should expect a daily allowance of 4 lbs. distillers grains, 2 lbs. ground corn and 2 lbs. bran in connection with hay as above, would be ample for the fresh cows, and for others the rule should be, feed no more than the cow will use for milk. Laying on flesh brings no profit in milk production.

A Missouri Ration.

Please give to me the best balanced ration for profitable feeding for my 15 cows, weighing 8 or 9 hundred pounds. Bran, $20; middlings, $23; oil meal, $28; corn 40 cents per bushel; oats 30 cents. We have mixed timothy and clover hay and a small amount of clover. We do not raise alfalfa in this section. At what price do you think we could ship it in at, to feed?

While I have only been reading your paper a short time, I have realized a great deal of good from it and never tire of reading its items. The dairy business is practically new in this section. We ship our cream about 60 miles. Very few people around here ever heard of a silo. We are much interested in your articles concerning them and we think of having one another season. W. C. C.

Grant City, Mo.

Abating nothing of our estimate of the value of alfalfa hay, we should consider it questionable whether it would pay to ship in alfalfa hay where one has clover and timothy in abundance. On the contrary, if hay is scarce and must be shipped in and alfalfa of good quality could be delivered at $10 to $12 per ton, it would prove an economical feed stuff, especially if parties have had the good judgment to save some of the corn stover. Otherwise, from the feeds named, we suggest for trial as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. mixed hay	17.06	.96	7.92	.32
4 lbs. ground oats	3.56	.37	1.89	.17
3 lbs. ground corn	2.67	.24	2.00	.13
1 lb. oil meal	.91	.29	.33	.07
Totals	24.20	1.86	12.15	.69

The probabilities are, we think, that the amount of hay specified may be more than most of the cows will eat without considerable waste and that for cows that have already commenced to shrink considerably in milk flow, the allowance of grain could be reduced. There is no rule for feeding that can be blindly followed, or supplant the exercise of good judgment by the feeder.

Abundant Feed but Poor Returns.

My cows freshened in August and September. They had fine pasture, and were fed three pounds of bran. After threshing, I began mixing oats with the bran, am now feeding three pounds bran and four pounds oats with all the alfalfa hay they will eat. They have never done so poorly. They have shrunk fully half their yield in two months; some tell me it is the oats. I have plenty of oats and corn; bran is $15 per ton. I am completely discouraged. Can you tell me the cause and remedy for my trouble? Have a young son of "Hart's King" to breed to now, but if cows won't give milk, I don't want any more.

A KANSAS DAIRYMAN.

We are quite positive the oats were not concerned with the shrinkage, and also quite positive that we are unable to say what was its cause. It may have been poor milkers, or leaving the cows out in the cold, or irregularities in the time and order of milking and feeding; or, if the cows have not been on the place for a year or more, it may have been homesickness. Possibly the cows got started on the wrong road, and are laying on flesh instead of making milk. It may be too late now to recover from this shrinkage, but it is worth while trying to do so. Try a pretty thorough change of feed. Get some linseed oil meal, and feed a half-pound per day at first, and increase to a full pound or more; grind some corn, cob and grain together, very fine and mix with bran 4 to 7 lbs. per day, with a large teaspoonful of salt, night and morning. Be absolutely regular in the hours and order of milking and feeding, and give plenty of time between meals for remastication (chewing the cud). Weigh the milk, night and morning, so as to know positively what changes take place. And, quite as important as anything else, get into a more hopeful and courageous state of mind. Other men make cows pay handsomely, and so may you. The young bull may be depended upon to give you profitable dairy stock, if it is handled with reasonably good judgment.

New York State Normal Farmers' Institute at Geneva.

ED. HOARD'S DAIRYMAN:—Director of Farmers' Institutes, F. E. Dawley, Com. of Agriculture, C. A. Wieting, Ass't Com. George L. Flanders, with Directors W. H. Jordan, of Geneva State Experiment Station, and L. H. Bailey, of the Agricultural College at Cornell University, are the originators of a new movement in institute work in this state, from which excellent results are expected.

This is the holding of Normal Institutes, one at the Geneva Experiment Station Nov. 23 to 25, the other at Cornell University State Agricultural College Nov. 30 to Dec. 3, inclusive. These institutes are intended not for the general public, but rather to increase the efficiency of the Institute lecturers in their regular work.

It is hoped to accomplish this by better posting them on all that is new in agricultural work and investigation, to bring them in closer touch with the Experiment Station and the Agricultural College, to compare notes and experiences and to secure greater uniformity in Institute work.

Dr. Jordan, Director, and Dr. L. L. VanSlyke, Chemist, on Animal Nutrition, Fertilizer and Feed Questions and other dairy topics, and Prof. S. A. Beach, Horticulturist, Prof. F. C. Stewart, Botanist, Prof. H. J. Eustace, Ass't Botanist, and Prof. Parrott on Horticultural topics, and Prof. H. A. Harding, Dairy Bacteriologist on Germ Life, Sources and Control and Cheese Biology and Diseases were the lecturers of the Station staff who had been selected to address the classes on the various subjects under discussion.

Each of these speakers had prepared a syllabus of his lecture, copies of which with blank pages for notes of the same were furnished to each speaker, thus furnishing valuable references for use in their work during the coming Institute season.

To advance the work of the Farmers' Institutes and raise them to a higher plane educationally, is the aim of Director Dawley and his associates, and the attendance at this meeting and the interest manifested are a good guaranty of benefits to be derived from this innovation in the opening of the season's institute work.

Dr. Jordan's first address on Animal

The Best Cooling Process

It has no peer for cream gathering, quick cooling and ventilation. Milk and water are not mixed. Undiluted sweet skim milk to feed to calves and pigs. Soon pays cost of separator. More butter, richer flavored, easier to keep clean.

Nutrition was given at the Monday forenoon session, and was considered of great value to the class of students in attendance.

Under the heading of Feeding Stuffs, he said in part: "All feeding stuffs (a few by-products excepted) contain essentially similar compounds, differing chiefly in proportions of compounds present.

These compounds may be classified into groups as follows: 1st, water; 2nd, mineral compounds, the principal substances aiding in nutrition being phosphorus, sulphur, lime, potash, chlorine, magnesia and soda; 3rd, protein as found in all the nitrogen compounds of the plant, such as albumens, globulins, amides, etc., differing greatly in composition; 4th, crude fiber, the woody part of the plant; 5th, nitrogen-free-extracts which include sugars, starches, gums, waxes, etc., containing no nitrogen; and 6th, ether extract (fats), various fats, coloring matter, waxes, etc.

The water of plants contains no element of special nutritive value above that of water drank by the animal. Its presence affects only the physical condition and palatableness of the food.

The mineral compounds enumerated are as important in their functions as any other food elements, all being required to a greater or less extent, in the growth and healthy development of the animal economy. The proteids, divided into albuminoids and collagena or gelatinoids, are of special value and importance, the albuminoids being the flesh-forming elements in the food while other compounds are not regarded as such. The proportion of protein in the form of albuminoids is much greater in grains than in coarse fodders and are also more readily assimilated. Crude fiber, the woody portion of the plant, is very abundant in coarse fodders and increases with ripeness of plants. This is found in very small proportion in grains. Its presence greatly affects the digestibility and value of the food.

The nitrogen-free-extracts, sometimes called carbohydrates, but which are not wholly such, vary greatly in different foods. In tubers and grains these are found chiefly in the form of starch, while in hays and other fodders, gums are abundant with but a very small proportion of starch; sugar is abundant in sugar beets, corn and sorghum. Ether extract (fats), as determined by chemical analysis, is a mixture of several fats and fatty acids with the impurities removed by a solvent. The per cents of these more nearly represent pure fats in grains than in coarse fodders, the coarse fodder extract being very impure.

The purposes served by feeding stuffs are to supply the animal's needs in providing body substance, energy for internal and external work and keeping up animal heat.

All groups of substances contribute to body tissues. Water is deposited, mineral compounds build up bone and are found in other tissues, albuminoids are the source of red tissue, hair, horn, etc., and possibly of fats; carbohydrates are a source of fats, and fats are directly deposited as such. Digested fiber probably may serve the same purpose as other carbohydrates. Digested protein, nitrogen-free extract, fiber and fats all supply energy and heat when consumed in the animal. Protein, fibre and nitrogen-free-extract have about the same heat value, fat 2¼ to 2½ times greater.

The energy function of food is one of great importance. The animal is a machine, performing work internally, as in the circulation of blood, digestion of food and the manufacture of new compounds; and externally, as in walking, drawing, trotting, etc., besides the warming of the body. All this requires energy, and such energy has its source wholly in the food, when the animal is not losing substance in its production. Whenever food is insufficient for these demands upon the animal, body substance is being used.

With a full producing cow, not over ⅓ of the food digested is used for milk, the remainder being used for work and heat; nd in a fattening animal not more than ⅙ of the same is used to increase body substance, the rest is converted into heat and work. It will thus be seen that energy function is very important, requiring, as it does, the larger part of food consumed by the animal.

The total energy of food is found by burning it and measuring the amount of heat evolved. This is not all available to the animal, there being a loss in the feces, urine and gases, and the remainder only being available. A portion of the available energy is used in masticating and digesting the food, and the larger the work of mastication the less is the proportion of net energy.

Digestible matter from all sources has not the same energy value per unit. The dry matter of coarse foods has a lower per cent of available energy than the dry matter of grains because less digestible and because of a greater loss of gases. Less of the available energy of the former is net because, also, the work of mastication and digestion is greater than with the grains.

This is an important consideration with an animal that is working hard or producing intensively, as is practically recognized by feeders who supply to highly-fed, hard-working animals a small proportion of coarse-fodder and a correspondingly larger proportion of grain. The same rule, too, holds good in compounding a ration of maximum efficiency for cows.

The factors that determine the nutritive value of a feeding stuff are: The dry matter it contains, the proportions of nutrients and its digestibility. Other things being the same, cattle foods are valuable in proportion to their dry matter. The proportions of nutrients determine in part the value of feed for a particular purpose. All vegetable foods are only partially dissolved and taken into the circulation, the feces being the indigestible portion. Their digestibility varies greatly and in comparing feeds of the same class digestibility is the nearest measure of value. E. J. BROWNELL.

Delhi, N. Y.

A Poorly Balanced Ration.

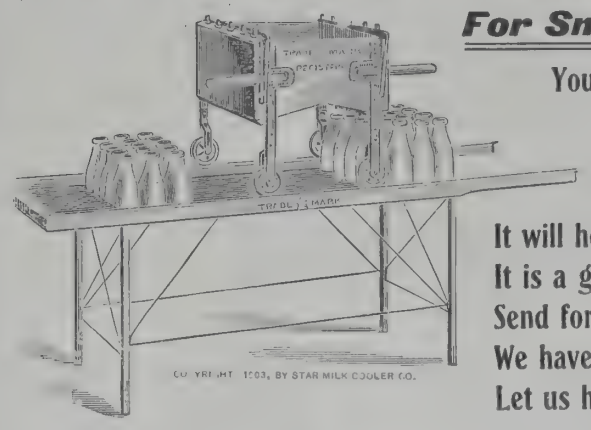
DEAR SIR:—In what respect is the ration I am now feeding deficient? My cows are giving a good flow of milk; but are too thin in flesh to look well. I would like them to look a little fatter. A fat cow seems to take the fancy of a prospective purchaser much better than a good milker, even when they are looking for a milch cow.

I feed as follows:

One bushel bran and two bushels fresh brewers grains, well mixed. Each cow gets ½ bushel to a feed of this. Some of the very large cows get a little more. This is given twice per day after milking.

They get all the mixed hay they can consume, clover and timothy. I have no silo, get warmed water twice per day. Do not go out of the barn.

I also have a quantity of Japanese millet hay; but owing to the extremely wet season it was put into the barn too damp and in consequence it moulded badly. Will this injure the pregnant cows if allowed to pick it over? I do not force them to eat it all. They also get of the mixed hay, as the milking cows.



Marshfield Wis. F. F. V.

The inclosed letter is an excellent illustration of how cows can be fed for good milk production and yet remain thin in flesh. The ration which these cows get is probably ample for them from a strictly milk-producing point. It is rich in protein but low in carbohydrates; hence the animals keep thin in flesh while giving a good flow of milk. These results, coming as they do, should be a good lesson to one who is trying to post himself on the best manner of feeding dairy cows. It stands in strong contrast with the operations of some dairymen who feed their cows excessively on corn meal, corn stalks, timothy hay, etc., in which case there is a tendency with the cows not to produce a large quantity of milk, but rather to dry up in milk flow and at the same time to lay on fat. Let one bear these two extremes in mind, and guide himself according to the desired results. If our correspondent wishes his cows to fatten toward the last of their lactation period, when he may wish to dispose of them, then let him make free use of Indian corn for such purpose. If our correspondent can secure shock corn, he can feed some of this unhusked, thereby affording grain in most palatable form, provided the ears are not too large, or corn meal may be fed. To fatten a cow as much as six or eight pounds, of corn or corn meal may be fed daily along with a reasonable allowance of other concentrates. W. A. HENRY.

Strangles.

ED. HOARD'S DAIRYMAN:—Is the disease contagious? The general conclusion which appears to be most consonant with the evidence at hand, is that the discharge from the nose of a horse affected with strangles, or the matter from the abscess which is one of the common features of the disease, is capable, under favorable conditions, of causing catarrh of the mucous membrane of the respiratory passages, swelling of the submaxillary glands and the formation of abscesses.

It is also in evidence that a microbe, the streptococcus of strangles, has, in a state of pure cultivation, caused the same form of disease, and further, it has been shown that the organism of ordinary pus has, by inoculation, induced abscesses. Under all the circumstances, horse owners are advised that the evidence of contagion is sufficiently strong to justify the use of proper precaution against the spreading of catarrhal affections, whether they are classed as common colds, influenza or strangles.

An epizootic of strangles, such as sometimes occurs among animals, which are leading a half-wild existence, may be dealt with by the employment of severe repressive measures. But generally, the idea of stamping out strangles would not be entertained for a moment, as, with common care, the disease is expected to end, and generally does end, in restoration to health.

Symptoms of strangles, in the first instance, are those of a mild attack of catarrh, and in an adult animal it would not be suspected that strangles existed until the special indications of the disease declared themselves.

One of the most characteristic signs of strangles is the pointing the nose in a forward direction, as the result of a feeling of stiffness at the bend of the neck. Swelling of the throat soon follows, and one or more small, hard nodules may be felt in the submaxillary space. Up to this time there may not have been anything beyond the ordinary watery discharge from the eyes and nostrils, which indicates the beginning of an attack of catarrh, but it may be remarked that symptoms of catarrh in young animals are naturally looked upon with suspicion which becomes certainty as soon as signs of the formation of an abscess under the jaw are apparent.

As strangles advances, the discharge from eyes and nostrils becomes thicker and assumes a purulent character. The swelling under the jaw increases, the head is thrust out in a more pronounced manner than at first and the fact of the disease being strangles is established.

Swelling of the throat in some cases leads to some difficulty in breathing, which is carried on with a peculiar noise suggesting strangulation, hence the name given to the disease.

Maturation, ripening and pointing of the abscess under the jaw are preceded and attended by a certain amount of fever, but in the common or mild form of the disorder it is not so severe as to give rise to any apprehension.

Presuming that the course of the disease is favorable, the pointing or softening of the abscess is followed by the diminution of the febrile symptoms, and, as soon as the abscess bursts, or is opened, the animal is considered to be on the road to recovery.

Sometimes the favorable progress is arrested from no assignable cause, the swelling does not take on the character of an abscess, but remains hard, and it is said by the attendant that "there are no signs of ripening." Such a state of things is always deemed to be serious, and it usually happens that the animal makes a slow recovery and does not improve in condition, but remains for a long time in an unthrifty state.

Cases in which the swelling under the jaw does not suppurate, occasionally terminate fatally from the supervention of disease of the lungs on the formation of abscesses in the internal organs. The old writers affirmed that such cases commonly ended in glanders, and in recent times this result has been repeatedly observed, but with the knowledge now possessed of the true character of glanders, it can only be concluded that the disease already existed in the animal's system in a chronic and obscure form, as it often does, and was roused to an active state by the general derangement of the organism, due to the presence of febrile disease.

Treatment of strangles may be summed up in the words "good nursing."

Fomentations and poulticing are necessary to encourage the pointing of the abscess. Attention to the diet is particularly demanded in the state of the throat, which prevents the horse from eating the usual provender. Gruel, linseed tea and soft mashes, milk with eggs, and, in cases of great weakness, good meat soup are all available, and in the selection of the diet the sick animal's taste must be consulted, so that the food may be taken voluntarily.

In all cases the risk of damage done by forcing liquid nutriment down the sore throat, should by all means be avoided.

Puncturing the abscess at the proper time is much to be preferred to leaving it to break, but premature lancing has been the cause of many disastrous terminations to cases which were going on satisfactorily. A bungling operator may cut into a vein or artery, and so carry some of the pus into the blood stream, with the almost certain result of inducing pyemia, or in other words distributing abscesses all over the body, and destroying the patient by a painful process of blood poisoning.

The foals of a common class, animals which are not worth special or luxurious care, and are accordingly left to the maternal protective instinct, strangles may run its course through the stages of febrile catarrh and formation of abscesses, which may point, burst and heal without anyone offering help or even knowing what is going on. When animals are running loose in droves, an outbreak of strangles left unchecked by sanitary measures, or medical aid, doubtless may, indeed does, assume a fatal form, and the killing, instead of the curing system, may be the most economical one to adopt.

An alternative plan of treatment, which may fitly be called the repressive method, was at one time advocated, under the belief that the disease was in no way specific in its nature, but merely an acute form of common catarrh, which could be cured by the employment of the antiphlogistic plan of treatment, or to employ a more intelligible term, a depletive system. Instead of fomentations and poultices to encourage the formation of the abscess, cold lotions were used to the throat, or a blister was applied as soon as the slightest swelling was seen, with the idea of dispersing it. Bleeding and purging were also advocated as the best means of lessening the fever.

It was claimed for the repressive system of treatment that strangles was now properly cured, or, at any rate arrested under its action, and also that the animal's recovery of its condition was more rapid and complete than when the milder methods of cure were used. Whether or not this was really the case was never determined, that I have heard of, owing to the strong prejudice among breeders against any attempt to check the natural course. It was considered better to let the malady "come to a head," and clear itself out of the system, than to stop it by heroic measures, an alternative which was, perhaps, rightly estimated rather as a device for putting off the evil day, than as a reasonable method of cure. In support of this conviction it might be urged that strangles left entirely to itself would naturally run a well defined course to a satisfactory termination, while to check the natural course of the disease would be attended with risk, and at the best could not be more satisfactory than the old-fashioned plan had proved.

Montreal, Canada. W. R. GILBERT.

Is it Practicable to Keep Cows Continuously on Dry Feed?

ED. HOARD'S DAIRYMAN:—I have been a reader of HOARD'S DAIRYMAN for five years and would not think of getting along without it, as it is brimful of information for every dairyman, and many an issue is worth double the price of a year's subscription. And still I am not a graduate, as there is always something to learn, and now may I bother you with a few questions?

I am now thinking of moving into the city and would like to know if cows can be successfully kept on dry feed the year round, as we will have no pasture and will be obliged to depend on the market for feed. If it is practicable to keep cows under such conditions, please give me a formula for a balanced ration from the following feed stuffs: Bran, $18; shorts, $19; rolled barley, $23; corn meal, $27; oil meal, $30; alfalfa hay, $16; wheat hay, $17; timothy and clover hay, $16.

I expect to sell milk to private families and shall cater to a high class trade. Milk is now worth from 7 to 8 cents per quart. My cows are Jerseys and will weigh from 800 to 900 lbs. M. B.

Portage, Wash.

It is practicable to keep cows continuously on dry feed, but it cannot be expected that they will do as well or remain in profit as long as they would if given succulent feed a part of the time, or could have at least a few weeks each year at pasture. They should have a yard in which to take more or less exercise and opportunity to get the benefit of perfectly fresh air, and the stable should be well ventilated, well lighted and kept scrupulously clean.

The feeds mentioned afford a wide margin for choice and it would be wise to change more or less from time to time. We should, however, place main dependence upon the alfalfa hay, bran and shorts, with a little oil meal most of the time to keep the digestive tract in good order and the bowels free.

We suggest as a basic daily allowance as follows:

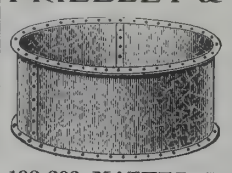
FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
18 lbs. alfalfa hay	16.49	1.98	7.13	.21
2 lbs. bran	1.76	.25	.77	.06
4 lbs. middlings	3.52	.51	2.12	.14
1 lb. oil meal	.91	.29	.33	.07
Totals	22.68	3.03	10.35	.48

There is really one pound more protein in such a ration than is necessary, but the protein in the alfalfa hay is as cheap as carbohydrates in other feeds, and the surplus protein is available by the animal for the same purposes as carbohydrates

It would be well, as before indicated to change, in whole or in part and from time to time, from the middlings to ground corn or barley, and have salt where the cows can help themselves at will, or give them a good teaspoonful night and morning.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN;—On Monday's Elgin Board of Trade there were no offerings of butter and consequently no sales. The Quotation Committee reported the official market firm at 25 cents, the same price as last week.



The output for the district aggregated 459,200 pounds.

The former markets were;

ILLUSTRATION

GIANT KILLER FEED GRINDER.

If the time ever was when Iowans felt they could be wasteful of the corn crop, that time has passed. That state not only takes the lead in the growing of that great crop, but produces some of the best patterned machinery for its provident use. A single instance of this is shown in the illustration herewith, the Giant Killer Triple Geared Feed Grinder, manufactured by the Cascadan Manufacturing Company at Waterloo. It

may be a surprise to some to know that this mill has been on the market for twenty-seven years, though not in its present perfected form. By many it is now accounted a leader amoung sweep mills. Though primarily intended as an ear and shelled corn grinder, it does equally satisfactory work in wheat, oats, rye, etc. The capacity, which runs from 20 to 40 bushels of ground feed per hour, is not marked by a corresponding increase in draft. For the great amount of work done the draft is exceedingly light. A special feature of this mill is its fitting with the Cascadan patent self-sharpening grinding buhrs. This mill appears in an advertisement elsewhere with the Northwestern Return Draft Steam Cooker, another excellent appliance for the feeder manufactured by the same company. Together they administer perfectly to the wants of every feeder, large or small. Circular fully describing may be had free by consulting the advertisement and directing to the Company at Waterloo, Ia.

DAIRY MARKETS.

ELGIN, Ill., Dec. 7—Butter ruled firm on the Board of Trade today, selling at 25c a pound, the same as last week. Sales in the region for the week were 459,000 pounds.

NEW YORK MARKET.

NEW YORK, Dec. 5—Butter—Receipts for the week, 29,145 packages. Exports for the week, 1,400 packages.

The quality of the fresh butter arriving has been so ordinary and poor that many retailers in town and out of town have taken finest freezer goods to take its place. High scoring extra butter however, is scarce and wanted at full prices, and is the correct goods for best grocers to use. The market for freezer creamery butter is dull, only very top qualities selling in small way at 22½c to 23c, and holders are growing anxious about the disposition to be made of the immense stock of June and summer butter held throughout the country.

Low grades are in full supply and prices favor buyers. We quote:

Creamery, fresh, extra, 25c; medium, 21@24c; poor, 18@20c; creamery, freezer, extra, 22@23c; medium, 20@21c; poor, 15@19c. New York Dairy, extra, 22@23c; medium, 18@20c; poor, 14@17c.

Cheese—Receipts for the week, 27,323 boxes. Exports for the week, 5,693 boxes.

Receipts were largely made up of western full cream, late made state and skimmed cheese. These styles were freely offered at all kinds of prices at 3 to 9c. Finest Sept. makes are in few hands and firmly held at quotations. We quote:

Full cream, extra, 12@12½c; medium, 10@11½c; poor, 6@9c.

Eggs—Receipts for the week, 30,447 cases.

Prices were forced too high for free consumption, and with lessened demand, prices dropped off 3 to 4c per dozen and are easy at the close. We quote:

New York & Pennsylvania, fresh laid per doz., 31@32c; Northern & Western, fresh per doz., 30@31c; all sections, poor to good, 20@28c. refrigerator poor to good, 20@28c.

177 Chambers St. DAVID W. LEWIS & CO.

BALTIMORE MARKET.

BALTIMORE, Dec 3.—Butter—With a continued scarcity of grades suitable for table purposes, there has been a further advance in prices and the market for the time being is quite favorable to the selling interest, Owing to the shrinkage in the current receipts of creamery, there is a brisk demand for all choice to fancy held creamery. Imitation creamery—There are no fancy lots arriving at all. Fresh ladles, when free from objectionable features, meet ready sale at quotations. while June and other held ladles are in ample supply and slow sale. Choice to fancy rolls meet quick sale. Packing stock is in moderate supply and demand. Blocks and Prints—There is a prompt sale awaiting all arrivals of choice to fancy stock. The general market closes firm, particularly on attractive qualities.

Creamery separator, extras, 26@26½c; firsts, 23½@25c; seconds, 19@23c: June creamery, extra, 24@24½c; firsts, 22@23c; seconds, 18@21; imitation creamery, extras, 20c; firsts, 18@19c; seconds, 14@16c, Iowa & N. W, Ladle, extras 16½c., firsts, 15@15½c; seconds; 13@14c; Roll Ohio, extras, 16c; firsts, 14@15c; seconds, 13c. Ohio Storepacked, firsts, 13@13½c; seconds, 12½c. creamery blocks (2 lbs.) extras, 26½c; firsts, 25@25½c; seconds, 21@23c. Creamery prints, (½ lbs.), extra, 27c; first, 25@26c; seconds, 21@23c; Md, Va. & Penna. prints, extras, 25@26c; firsts, 22@23c; seconds, 19@21c. Renovated butter, extras, 19c; firsts, 17@18c; seconds, 15@16c.

Eggs—Although stock good enough for strictly fancy trade continues in light receipt, the supply is about equal to the requirements. as the prevailing prices have been the means of retarding the demand no little; consequently there has been a big demand for choice to fancy storage, which in many instances has proven more desirable than the so-called fresh. Judging from present appearance, eggs have reached the high water mark, and it would not be at all surprising to see lower prices at no distant day. The market today on fresh eggs closes quiet and barely steady at 30 cents.

301 Exchange Place. G. M. LAMB & BROS.

SAN FRANCISCO MARKET.

SAN FRANCISCO, Dec. 7—While general supplies of butter were heavy yesterday, they included but a small percentage of really fancy offerings and with the principal buying interest centered in this grade the market maintained a steady tone at the recently revised figures. The special brands of Creamery were held well in hand at the top quotation and despite the cautious buying of operators, offerings were well absorbed. In small ways as high as 31c was still paid for the more favored marks, but this price was too exceptional to be justified as a quotation. The demand for the medium and undergrade butter was sluggish and despite the inducements offered, sellers reported an unsatisfactory market. The day closed with a heavy surplus uncared for and prices leaning strongly toward easiness. Prices for Ranch eggs eased off slightly under a less brisk demand and larger offerings. Supplies were well cared for at the revised figures and the market ruled steady, with the best grades of Ranch easily bringing the outside price. Storage eggs were in good demand, and the ruling rates were firmly held. Cheese was in good supply and prices remained the same as for some time past.

Receipts yesterday aggregated 26,200 pounds butter. 611 cases eggs and 4,300 pounds cheese.

Butter—Creamery, extras, 30c; good to fancy, 25@29c; dairy, extras, 23@24c; dairy, choice, 21@22c; store, 18@20c; California storage, 24@27c, eastern creamery, 23@25c.

Eggs—Ranch, selected large, 52½@53c; good to choice, 45@50c; store, nominal; California storage, 28@32½c; eastern, 25@30.

Cheese—California creamery, mild, new, extra, 14@15c; mild, new, choice, 13½@14c: Young America, 14@15½c; eastern, New York, Cream, Cheddars and Flats, new, 14½@16c.

Wanted—An energetic single man to work on stock farm, with fine herd of pure bred Holstein cattle. Must be good feeder and milker or one anxious to excel in this line of work. State experience, references, and wages in first letter. Address W. J. YOUNG, White Bear Lake, Minn. 43-2

Milk Business For Sale—A 70 gallon milk business for sale at a bargain if taken within the next six weeks. No cows, all milk bought. Address W. M. T., care Hoard's Dairyman. 44-2

Wanted—Practical dairyman of experience. One who thoroughly understands feeds and feeding and can feed for profit. Must be sober, good milker, active, and willing to work. State wages and experience and give references. Address CHAS. E. POLLEY, Van Tassel Farm, DuBois, Pa. 44-2

Wanted—Carload fresh or close springers. Information and price F. O. B. to any one accepting order. W. J. HYSHAM, 2565 Ames Ave., Omaha, Neb.

Wanted—Position as superintendent by practical farmer, dairyman and breeder, or will take farm on shares. E. R. AUSTIN, Three Rivers, Mich. R. F. D., No. 2. 44-2

Dairy Questions Answered by Prof. Farrington.

HEATING the CREAMERY.

"I must soon put in steam pipes in order to be ready to warm the creamery in preparation for cold weather and I want to know the best way to arrange these pipes. I am of the opinion that if the steam pipes were hung up near the ceiling and one end connected to the main steam pipe with the other end draining back to the blow-off pipe or feed water pipe, that the condensed steam will drain back into the boiler. I want to know if the steam pressure in the top of the boiler will force the condensed water from the heating pipes back into the bottom of the boiler? If this can be done I will save all the condensed steam. If this will not work please tell me how to arrange the steam heating of my creamery from the boiler. In other factories where I have worked, the condensed steam from the heating pipes was allowed to flow into the drain. This it seems to me is an unnecessary waste of good, soft water. If you will suggest some good method for heating my creamery by way of the high pressure boiler I shall be much obliged to you."
West De Pere, Wis. * * *

As the boiler used in the creamery is run under high pressure, it will be necessary to adopt one of two systems for heating the various rooms in your creamery.

The first one of these is to place all the pipes in the different rooms so that they will be higher than the boiler and the condensed steam will drain back to the boiler by gravity.

The second one is to place the heating pipes in the rooms below the water level of the boiler, and if the condensed steam is collected and saved by means of a steam trap and hot well, this water may be pumped back into the boiler.

The principle objections to the first system of heating, that is, placing the heating pipes all higher than the boiler, is that you will be obliged to leave the steam supply valve always open in the heating coils in order to give a free passage of the condensed steam back to the boiler. You can only shut off the heat from them by closing the valve that connects all the heating pipes with the boiler. By this arrangement you cannot regulate the heat, you will be obliged to have either the pipes all full of steam or all empty. Another objection to this system is the waste of heat which will be caused by making it necessary to put all the pipes so high up in the different rooms, as will probably be the case if they are all placed at a height which will enable the water to drain back into the boiler. If you have only a small room to heat and will need it heated most of the time when you are running the boiler, you can make such an arrangement as this very easily and it will not need much attention, but with any great amount of space to heat you will not be able to regulate the temperature at will.

If you wish the heating pipes in the different rooms at places where they will be below the water level of the boiler, you can invest about $25.00 in a steam trap and collect the condensed steam in a hot well from which it can be pumped back in the boiler. With this arrangement you can put in valves and shut off the heating coils in different rooms as you wish. You will at the same time save the steam which condenses and can use it in the boiler, over and over again.

I think you will like the latter system much better than the former and if your factory is heated it will pay you to make an effort to have this work well done.

PASTEURIZING SOUR CREAM.

"As a former Wisconsin buttermaker I beg to ask your advice on pasteurizing hand separator cream of high acidity. I want to know if the machines now in use are adapted to the pasteurization of ripe, heavy cream containing from thirty to forty per cent fat. I have just begun work in a new plant and find that the pasteurizing of the cream will be a necessity if we hope to turn out a high scoring butter. I am well acquainted with the use of commercial starters, but I have had no practical experience in pasteurizing and I am anxious to start right so have written you.
Wisheth, N. D. * * *

We have done some work in the pasteurization of sour cream and find that it can be very successfully done in the Farrington pasteurizer. I am making some experiments on this point at the present time, but so far as I have gone I feel safe in saying that success will attend the introduction of this practice into creamery work.

The extensive use of hand separators by farmers has changed the creamery business in certain lines to a great extent and new methods and machinery must be designed and used for adapting ourselves to these changed conditions.

The hand separator cream which comes from farms is received at creameries or central churning stations in all conditions from sweet to ripe and over-ripe. Butter makers who have had experience in creamery butter making will realize that if the lots of sweet cream may be separated from those which are somewhat tainted, an extra quality of butter may be made from the sweet cream, even if it has been separated on the farm. The making of fancy butter, however, from the tainted and sour cream which is received from hand separators is a problem which will tax the ingenuity and experience of the most expert butter maker.

In so far as my experiments have gone they seem to show that rich, sour cream, even if it contains, as you suggest, thirty to forty per cent fat, will be improved and a good quality of butter made from it if such cream is pasteurized as soon as it is received at the factory. I think as a rule that it is not advisable to attempt to ripen such sour cream with a starter. This is especially true when the cream on arrival contains in the neighborhood of .5 of one per cent acid. Such cream will not develop much more acidity than this and if a starter is added to it, the acidity of the starter will simply exaggerate the defective flavors already present in the milk or cream. I once thought that a well selected starter would cover up the defects in tainted sour cream, but some experiments which I made at a gathered cream factory, have led me to believe that this is a very difficult thing to do and that more satisfactory results will be obtained with such cream if it is pasteurized at the earliest possible moment after receiving it and then churn as soon as pasteurized, than will be the case if this cream is pasteurized and an attempt is made to ripen it after pasteurizing.

These suggestions only apply to the very sour, small lots of cream that are received from many sources at one factory. When the hand separator cream is in good condition, that is, perfectly sweet and contains no fermentations which may cause defects in the general flavor, such cream may be pasteurized and ripened with a well selected starter to good advantage. Pasteurization I am sure will prove to be very beneficial in the handling of this new product which is being received from the farms in many sections at the present time.

SAVING COMPOSITE SAMPLES OF CREAM.

This creamery for which I do the testing has about 2,300 patrons. The cream which is received averages 17 per cent fat and each month the composite samples amount to nearly seventy gallons of cream. We use bi-chromate of potash for a preservative. All this cream goes to waste. Now, can you tell me of a preservative that is "just as good" and not poisonous; one that will color the cream and still allow it to be churned and made into pure butter? It hurts me to see so much value going into the sewer. * * *
Auburn, Me,

The only suggestion I have to make that will help you in saving the seventy gallons of cream you throw down the sewer every month, is to churn this cream drain off the butter milk; wash the granular butter thoroughly in the churn, and then use it, either as it is when taken out of the churn, or, after melting it, for soap grease. I think you will find that in this way the fat may be safely utilized, and it ought to make a good soap.

If you do not care to make soap from it, the grease can be used for lubricating purposes, although it will hardly be ad-

A SURE TEST

Of Whether Coffee Really Hurts or Not.

Some folks drink coffee and suffer day after day but console themselves by saying "I don't believe it hurts me or at any rate I am not sure that it does."

"The sensible thing to do is to make sure by leaving off coffee and using Postum for a week or so. The trial is pleasant and you may learn something worth more than money to you in the way of health and strength.

An intelligent woman who valued her health and comfort made sure. She says: "I have proved positively that when I used coffee I had kidney and bladder trouble, palpitation of the heart, stomach trouble, insomnia and my complexion was sallow and muddy, but I got rid of all these troubles when I quit coffee and took on Postum Food Coffee. All my troubles disappeared quickly, almost as if by magic, and in their place I became strong and well.

"I soon learned to like Postum as well as I ever liked coffee and I would not exchange my delicious cup of Postum for coffee and sickness for anything in the world." Name given by Postum Co., Battle Creek, Mich.

visable to attempt to use it in any kind of food.

I do not know of any preservative that it will be safe to use in your composite samples with the expectation of making butter from the samples after they have been tested. All the preservatives that are capable of keeping cream sweet, so far as I know, are injurious when used in any kind of food. I would not therefore attempt to use the fat left in these composite samples for any other purpose than as grease, either for lubricating machinery or for making soap.

The loss which you mention, of seventy gallons of cream per month, containing 17 per cent fat, is not such a very heavy one when yon consider the advantage which this testing is to the factory and to the patrons; 70 gallons at 8 lbs. per gallon, is equal to 560 lbs; if this tests 17 per cent fat, it contains 17 × 560 or 95.2 lbs. fat. Assuming then, that you lose on an average about 100 lbs. of butter a month by throwing away the composite samples, this, at 25 cents per lb. is only $25, which sum is worth saving if it is possible to save it, but at the same time it is not a very great loss compared with the benefit the large number of patrons derive from the testing. I think that probably you and all the patrons would be willing to pay even more than this rather than to run the business without testing the cream.

Your letter does not state how you take these composite samples, but the amount used in sampling may be reduced to a minimum if the drivers on the different routes will take with them a box of sample bottles and add a sample of the cream at each farm to a bottle labled with the name of the patron. This box of sample bottles ought to be well protected from heat in summer and cold in winter, so that when it arrives at the creamery, the manager, or the man who receives the samples, may examine them as they first come in, and find out which ones of the patrons are responsible for the good and for the bad cream, which may have been collected by each driver every time he makes a cream-gathering trip. Such samples as these give the butter-maker a fine opportunity for inspecting the cream that was delivered to the driver at the farms, and he may be able to locate the cause of any defects which may be noticed in his butter at the factory.

When these samples arrive at the factory it is not necessary to use all of each sample for the composite test, but after each bottle of cream is inspected, a small quantity of it, if in good condition (perhaps 10 c. c.) may be added to each patron's composite sample jar at the factory. This sort of an arrangement may help to reduce to a minimum the amount of cream used for the composite samples and reduce your loss of fat from these samples to its lowest terms.

Cultivating Corn with Smoothing Harrow.

ED. HOARD'S DAIRYMAN:--I would like to ask through the columns of your paper regarding cultivating corn Is it safe and good farming to run a smoothing harrow over the corn as a weeder when the corn is ½ to 1 inch high, that is, with the teeth turned partly down and the horses going lengthwise of the rows? Is the corn injured by the use of the smoothing harrow or will it spring up as good as ever if knocked over? A gentleman of farming experience informs me the smoothing harrow adjusted as above is much better than the wire weeders and that the same being used twice a week on corn until it gets 4 to 6 inches high will keep the corn free from weeds; that no hoe will be required and that no injury is done, notwithstanding it may so appear on the day of use. Have any of the readers of HOARD'S DAIRYMAN had experience in the above method, which would seem rather rough to me? T. R. W.

St. Albans, Vt.

As this inquiry invites answers from our readers, it is respectfully referred to them without editorial comment.

Carbolic Acid for Abortion.

Some Satisfactory Practical Experience.

ED. HOARD'S DAIRYMAN:—I see you think carbolic acid is not a specific for abortion unless applied to the affected parts. You may be correct, but from my experience, I question the correctness of it. Carbolic acid taken into the stomach enters the circulation, and tells upon the entire system. But let me give my experience with abortion in a herd of 50 cows.

A few years ago I got several Jersey heifers from a herd in western Massachusetts. Soon after their arrival, I noticed one only a few months in calf, making bag unnaturally, with other maternal developments. Soon a less than a half grown calf appeared and soon others followed. From that time on I have been troubled with it both in stable and pasture. I applied remedies as recommended to the stables, but could not do it away from home, at pasture. In the fall of 1902, I brought several from pasture and six of them showed unnatural, maternal development, prominent bags and other sexual parts. From previous observation, I was satisfied abortion was on the road at a rapid pace. I determined to make a faithful test of carbolic acid. I commenced in November to give each one twenty drops in a little water every two days. I continued the treatment until spring and kept the abnormal development in check so that at the due time they each brought healthy calves. Also gave the acid occasionally to several others which had previously aborted. You can say that I might be mistaken about the six heifers, but I am satisfied my judgment was not at fault, for I have had a large experience, with close observation in this matter. GEO. W. HUMPHREY.

Plymouth Co., Mass.

GIVE YOUR STOMACH A NICE VACATION.

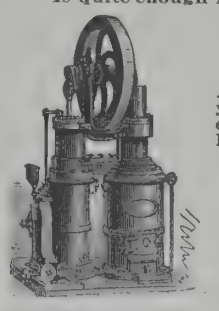
Don't Do It By Starving it Either—Let a Substitute Do the Work.

The old adage, "All work and no play makes Jack a dull boy," applies just as well to the stomach, one of the most important organs of the human system, as it does to the man himself.

If your stomach is worn out and rebels against being further taxed beyond its limit, the only sensible thing you can do is to give it a rest. Employ a substitute for a short time and see if it will not more than repay you in results.

Stuart's Dyspepsia Tablets are a willing and most efficient substitute. They themselves digest every bit of food in the stomach in just the same way that the stomach itself would, were it well. They contain all the essential elements that the gastric juice and other digestive fluids of the stomach contain and actually act just the same and do just the same work as the natural fluids would do, were the stomach well and sound. They, therefore, relieve the stomach, just as one workman relieves another, and permit it to rest and recuperate and regain its normal health and strength.

This "vacation" idea was suggested by the letter of a prominent lawyer in Chicago. Read what he says: "I was engaged in the most momentous undertaking of my life in bringing about the coalition of certain great interests that meant much to me as well as my clients. It was not the work of days, but of months. I was working night and day almost, when at a very critical time my stomach went clear back on me. The undue mental strain brought it about and hurried up what would have happened later on.



"What I ate I had to literally force down and that was a source of misery as I had a sour stomach much of the time. My head ached, I was sluggish and began to lose my ambition to carry out my undertaking. It looked pretty gloomy for me and I confided my plight to one of my clients. He had been cured by Stuart's Dyspepsia Tablets and at once went down to a drug store and brought a box up to the office.

"I had not taken a quarter of that box before I found that they would do all the work my stomach ever did; and as a rest or vacation was out of the question for me, I determined to give my stomach a vacation. I kept right on taking the tablets and braced up and went ahead with my work with renewed vigor, ate just as much as I ever did and carried out that undertaking to a successful issue. I feel that I have Stuart's Dyspepsia Tablets to thank for saving me the handsomest fee I ever received as well as my reputation and last but not least my stomach."

Stuart's Dyspepsia Tablets are for sale by all druggists at 50 cts. a box.

Constructing an Ice House.

From my experience in building ice houses, there are two or three weak points in the general construction of this class of buildings. The first is in making a poor foundation, thus securing a lack of drainage. The second is a roof, on which the sun generates such intense heat that the inside of the house is more like an oven than a place for keeping ice. Sometime ago I desired to build a house that would hold over forty tons of ice, and it was built on the following plan: I give you herewith only the general directions, for those who are differently located may

want to change the plans somewhat. While little scope is usually given in the selection of a site, there are certain precautions to be taken in order to secure a good bed of ice.

If the site chosen be on a little rise above the adjacent ground level, surface drainage will give no trouble; otherwise provision for it as well as the water from the melting ice, must be made. For preparation for the foundation of the house, which can be placed on stone or cement walls, or on cedar posts set in the ground two feet at least, excavate at least one foot below sills, and fill with cobble stones or very coarse gravel the whole of the inside between sills, smoothing off the surface with fine gravel or cinders. If the digging shows a clay soil, a drain should be put in to carry off surplus moisture, carrying drain well under the gravel. Scantlings can be bedded in the fine gravel on which to place a floor of cheap lumber, placed one inch apart to permit the water to pass through readily. It takes on an average from 40 to 45 cubic feet to hold a ton of ice, consequently a building 12 by 16 feet by 12 feet high, would hold about 45 tons of ice well packed. I use 3×12 sound pine plank for sills and for uprights 2×6 scantling 12 feet long, placed two feet apart, at each corner, putting in an extra piece to catch lining on the inside. On the top I spiked 2×6 scantling doubled for plates. On

END VIEW OF INTERIOR

the outside of house. I nailed sheeting of common lumber, on which I tacked a double thickness of building paper, then strips 1×2×12 feet long. Over this a double thickness of building paper and finished with matched siding. This gives a hollow space of dead air of one inch to prevent heat of the sun penetrating to inside lining, care being used to see that

GEORGIA LANDS are as well adapted to wheat and diversified crops as to cotton and sugar cane; as well adapted to wheat as any state in north or west. There's everything in Georgia, from gold mines to fat hogs. It is the largest state east of the Mississippi river; has varied altitude, from ocean to mile-high mountains, and climate to suit all. Here are health, happiness, homes, wealth for your industry. Don't guess wrong about Georgia. Get figures and facts. We send them free.
GREATER GEORGIA ASSOCIATION, - Atlanta, Georgia.

the space is well cut off at top and bottom. On the inside I nailed sheeting, filling the six-inch space with cinders, shavings or sawdust, as is most convenient, (I used cinders). Over this sheeting I nailed a double thickness of paper, on which was nailed one-half inch strips again, and on these, sheeting, thus making two hollow spaces of dead air one inch each and one space of six inches filled; six thicknesses of building paper, three of sheeting and one of good siding.

For the roof I used 2×4 for rafters, lining the under side and filling between the rafters with dry shavings; under the shingles I placed two thicknesses of building paper, placing a ventilator in the center of the roof, made so that it can be closed inside if desirable. The door should be made in two halves, and a door in the gable over the plate to put in and take out the ice for two top layers. The gables should be built the same as the walls. If the outside of the building is painted white it will help to keep the building cool. At the time of writing (July 22) there has been no waste of ice around the outer edge. I believe I have secured a good house at the cost of $65 and my own time in building. Any

farmer should be able to do this work himself in slack times. In filling the house I placed the ice on its edge, placing every alternate layer crossways. Ice will keep better and come out easier packed this way. Opposite the doors I laid short pieces of boards and filled the door space with shavings. When the house was filled I placed two feet of straw over the ice, tramping it well. Marsh hay would answer the purpose better.

We are using the hay and straw for our cold storage house and all of the large ice-houses are doing the same. I can keep my ice through the summer with the loss of only one ton.

—ROBERT THOMPSON, in *Prairie Farmer.*

A South Dakota Ration.

Please make out a ration for my cows for profit and health. I have five now and will have five more. They consist of half cows and half heifers having their first calves. My herd consists of grade Holsteins, Short-horns and Red Polls. They give 100 lbs. milk a day. I get 20 cents a pound for butter, from which 5 cents a pound has been taken off for hauling, shipping and manufacturing the cream, by the Hanford-Haselwood Cream Co., Sioux City, Ia. I feed them as follows:

Eight pounds of millet hay, containing the millet seeds; 6 lbs. of hay, consisting of ⅓ green foxtail, ⅓ yellow foxtail, ⅓ slough grass; 6 lbs. of soft, immature corn, containing cob and husks, about 3 lbs. of this is corn; 2 lbs. bran. They get all the corn stover they want to eat; little salt twice a day. I have all the feed of my own, except bran, middlings and oil meal. Bran, $14; middlings, 16; oil meal, $30. J. B. S.
Perkins, S. D.

If these cows are fresh in milk, or nearly so, and are not expected to freshen again for 10 or 12 months, we think it would be profitable to increase the allowance of grain by, say, 2 lbs. of bran and 1 lb. of oil meal, making in all 8 lbs. of grain daily. A dairyman should remember that his entire profit comes from that part of the daily feed which is not required for the cow's bodily maintenance. The cow, by the very law of her nature, looks out for herself first, and only after the demands of her own body are satisfied, does she commence to transform feed into milk—and some cows make a poor showing, no matter how much they eat. It therefore behooves every dairyman, who is keeping cows for profit, rather than for show, to watch results carefully and feed accordingly.

HOLSTEIN-FRIESIAN ASSOCIATION OF AMERICA.

STAR FARM

REGISTERED HOLSTEIN-FRIESIAN CATTLE

CORTLAND, NEW YORK

HOME OF
MERCEDES JULIP'S PIETERTJE PAUL
No. 29830

CHAMPION BULL OF THE WORLD

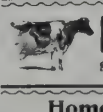
"STAR FARM" offers special opportunities to intending purchasers. Registered Holstein Cattle of choice breeding and individual excellence. The actual sale of nearly one hundred head from this herd within a comparatively recent date is strong evidence. In view of the growing demands on this herd I have determined to publish from time to time some of the many testimonials which I receive from my many customers. Your attention is respectfully called to the following:

'Mr. H. L. Bronson, Cortland, N. Y. Dear Sir: I take great pleasure in writing to you as all of the Holsteins that you shipped me have turned out better than I expected. I realized before purchasing that it was important for me to get the right kind of foundation stock, but confessed that I was a little in doubt as to how this result could be obtained. However, you have solved the problem to my perfect satisfaction. I hope to be able to visit "Star Farm" again this fall and make more liberal purchases from you than before. In the meantime let me wish you the best of success. Very cordially yours, H. WILLIS GAZLAY, Accord, N. Y., 1903.

Phoenix, Arizona, Nov., 1903
Mr. H. L. Bronson, Cortland, N. Y.
Dear Sir: Before starting for the east to purchase Holstein cattle I was informed by local buyers that eastern breeders held their cattle at such long prices that it would be impracticable for me to get a carload for this market. However, I visited "Star Farm" and had no difficulty in obtaining just what I wanted and at very reasonable prices. I can cheerfully recommend all intending purchasers to you and assure them your stock is right and your prices moderate. Expect to visit "Star Farm" again next spring and shall call on you probably for two carloads. Yours truly, A. STARKWEATHER.

Oneida, N. Y., 1903.
Mr. H. L. Bronson, Cortland, N. Y.
Dear Sir: The four Heifer Calves arrived in splendid condition and I am very much pleased with them. Their superior individuality and breeding has already been recognized by the leading breeders of this community. As evidence of more substantial nature of my appreciation of your method of transacting business will state you may book my order for a bull calf from Mercedes Julip's Pietertje's Paul and an A. R. O. cow: Thanking you for the many courtesies bestowed upon me while at "Star Farm", I am, very truly, FRED H. RIVENBURGH.

Hollyrood, Middletown, N. Y., Nov., 1903.
Mr. H. L. Bronson, Cortland, N. Y.
Dear Sir: I trusted to your intregrity as a man and your judgment as an expert to select for Hollyrood fifty registered Holstein Cattle of choice breeding and individuality. The cattle have arrived and after careful inspection I congratulate you upon doing better than you promised and better than I expected.
Very truly yours, JAS. H. WALLICK.



I solicit correspondence of all intending purchasers. I have at the present time about one hundred registered Holsteins to select from and am offering special bargains in cows, service bulls, calves of both sexes. I can save you money, write and get prices and description of cattle before purchasing elsewhere.

H. L. BRONSON, Cortland, N. Y.

LOOK HERE

34 cows and heifers in the **McGEOCH HERD** have been **officially tested** with the following results: 10 cows average 20.26 lbs. butter in seven days; average per cent of fat 4.06. 7 four-year-olds average 16.82 lbs. butter in seven days; average per cent of butter fat 3.93. 9 three-year-olds average 15.06 lbs. of butter in seven days; average per cent of fat 3.50. 8 two-year-olds average 12.16 lbs. of butter in seven days; average per cent of fat 3.60. We have a few young bulls out of some of these cows, and sired by **Gem Pietertje Hengerveld Paul De Kol,** or **Sir Ormsby De Kol** for sale. One of these is out of a cow that made official record of 24.88 lbs. of butter in seven days; average per cent of fat 4.47. Are these the kind of **Holstein-Friesians** you wish? If so, can we not interest you in putting a bull from this class of stock at the head of your herd?

For particulars address **H. B. Daggett, Mgr., Station A, Milwaukee, Wis.** Residence: National Ave., near 40th. Phone, South 1601.

"Breeding and Rearing a Profitable Dairy Worker."

ED. HOARD'S DAIRYMAN:—It is good to see an article by a woman in the DAIRYMAN now and again. An article by a woman more particularly interests the women folks on the dairy farm; and if this writer is to be heeded—and she surely ought to be—we want more women in the dairy so that the work of attending to the matrons of the dairy be not left entirely to the sterner sex. On this farm, women take a very important part in the dairy, and it is only simple justice to state that whatever success has been achieved in our dairy practice, the credit should be given to the women on our farm, few as their numbers are.

It is our privilege to have a little business acquaintance with Mrs. Howie, and on this account perhaps our folks are more interested in the lady's article than some others might be. The article in question was read with much interest by "our women", and commented on freely in the household. When it was stated that the calf should be left with the cow for three days, "That's me" asserted "our women." "I never go for taking a calf away from the cow, as some writers advise. I always leave the little calf three days with the cow, and after that time place the little calf in a pen where the cow can see and fondle it. What sympathy can you expect men to have for cows?"

A second proposition laid down by Mrs. Howie is sound, in that the cow, at least when fresh, should be milked three times a day, and be repaid for the extra trouble, not only in the charity toward the cow, but as the mere dollars and cents man would have it, in more milk. I do not, however, think it necessary to milk three times a day for more than two months after freshening, though, with a heavy milker, I am sure it will pay good interest to milk three times a day right along.

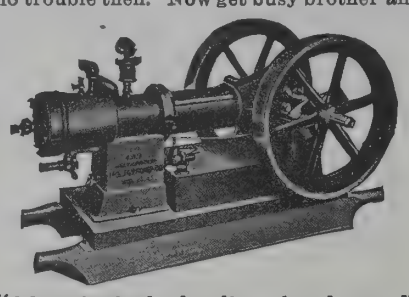
A third proposition laid down by Mrs. Howie, did not receive general approbation in our house, viz; to stop feeding grain after six months of age. My father who has some good ideas of live stock management, when this was read, would not agree to this proposition, asserting "That is something that I would not agree with, and think a little strange. Our heifers would not be what they are, if grain was withheld after six months of age. They received grain till they were 12 months of age.

Be this as it may, there may be local conditions which prompt the lady in withholding grain after six months of age; but we do not understand what they can be, or upon what physiological reasoning this practice is arrived at. We have a heifer now milking fifteen pounds per day, after some five months in lactation, having freshened when twenty-three months old; received grain right along, until almost fourteen months of age, and was only six months in her life time that she did not receive any grain, and we have never seen a heifer that would make more and better use of roughage. Another heifer now due to calve at twenty months of age, much larger and robust, never was a day in her life but she received a small grain ration. We are sorry we cannot agree with Mrs. Howie in this instance.

A fourth proposition, to milk the heifer right along until she freshens is certainly sound, and of course feed must accompany this persistent milking. When she says also, that three months before calving the heifer should receive particular attention in both feed and manipulation of the udder, etc., we are with her, only that we would go a little farther, and not wait until three months, but begin six months instead of three, handling and caring for the young mother to be. We are sure that handling and manipulating and massaging of the udder, abdomen, and milk veins for some considerable time before freshening is the most important point of all; at least we have found it so with our native cattle. Probably with high bred Jerseys this may not be so important, but we never had any experience with pure breds, not even grades. Probably in this we are not living up to our privileges, but we are working out original problems of our own in sticking only to native or scrub cattle, and we rather like it. We are under no obligations to the people in the European countries for giving us a dairy cow ready made.

Not for our own interest alone, therefore, are we glad to see this article of by a woman, but from the fact that such articles will more likely interest the women on the farm to take greater interest in the cows. Women beat men as milkers, and we believe if only women milked, there would be more and better milk, and better cows, and more money from the dairy. There is too much arithmetical dairying—too much dairying by figures and intellectual deduction, and not enough of sentiment and emotion. Milk giving is an emotive act, an act of affection, sympathy or love, as you will. It is not at all the matter of finding the value of x in an algebraical calculation. Talking about labor saving devices, indeed, why! what is wanted is conditions which keep the dairyman and the cow almost continually in each other's company. This is well put by Mrs. Howie. We advise the dairyman with the modern conveniences and the labor saving devices, to read this article of Mrs. Howie's over and over again, and commit it to memory. We believe it will materially change his practice, if heeded, and also change his bank account.

J. A. M's. OCTAGON SILO.



A correspondent doubts that the silo mentioned can be built by a farmer handy with tools and with good help, for the sum of $25. In the silo referred to it was

FOOL-PROOF

BECAUSE IT'S SO SIMPLE

THE ELI GASOLENE ENGINE } Is the BEST because it has no gears, cams, levers or valve mechanism. Don't Be Jollied into buying a complicated engine that's always out of order—get the ELI—no trouble then. Now get busy brother and write for booklet to-day.

Eagle 4 H. P. Stationary Engine

1904 MODEL

THIS ENGINE is of the four Cycle type and is especially designed and adapted for use on the farm—for separators, churning, pumping, elevating, hoisting, cutting ensilage, etc. No Expert or Engineer required to operate it—very simple in design and compact in construction. This engine is built so it can be easily moved from place to place. We can supply a special belt driven pumping jack to be used in connection with any pump having a wind mill head. Write for prices and description to

EAGLE BICYCLE MANUFACTURING CO.,

Engine Department. TORRINGTON, CONN.

stated that the owner drew logs to the mill and considerable of the lumber required sawing. When one has his own lumber, the cost is greatly reduced, but that is not all, for in getting material sawn to order, one can get a first rate job done, while lumber purchased in the ordinary city lumber yard is not always right for use unless made so by running through a planer.

Admitting that 1,800 ft., inch or seven-eighths boards are required for the lining of this silo, why should it cost $75 to $80? We never knew rough boards to cost one-third of thirty dollars per thousand. I can go this minute to our saw mill, a mile away, and purchase 1,800 feet of ⅞ inch boards for $14.40. Finding the logs, I could get the joists sawed for $3.00. I can buy a keg of spikes for $2.70, and enough paper for $2.30 and a barrel of cement for $2.50, and begin erecting this silo myself, with our ordinary help, and have it ready for silage in less than three days. That means a total outlay of about $25. In the silo mentioned in November 6th issue, the owner found the scantling, that is the 2x7 stuff, and there is no charge for it. With regard to the hemlock boards, I would go to a saw mill for them if possible, and not to a city lumber yard, where they might be all thicknesses, and would have to be run through a planer to make even thickness. They do not need to be planed on one side at all, nor do they need to be of equal widths to break joints if the boards are sawed reasonably well, and any mill man who takes any pride in his work will turn them out. Spruce is usually dearer than hemlock, but it is on spruce I have figured above. A full seven-eighths, (which means 15-16), is plenty thick for this silo, and these boards do not need to be even widths, but are butted square at say twelve feet. Such boards are the cheapest sold on any market, and I never knew them to go as high as $10 per thousand here. The market price of such boards, no feather edge, no dry rot, is $8 to $9 per thousand at the mills.

If I were building the silo under consideration, I would not have to make a cash outlay of as much as $25. I would go to my own woods, cut the logs for both boards and joists and bring them to the mill and have them sawed to the size required. I would either pay the miller in cash or logs. Our miller will now saw three logs for two. It used to be one for one, so that my lumber bill would not amount to eight or nine dollars, or nothing at all. In the article refered to it was especially stated that the party "drew a couple loads of logs to a nearby sawmill." Of course when one has to go to a lumber yard and pick out material, if rough material is wanted, one cannot always get what is wanted in the rough. And these parties want to keep their machinery agoing, and insist on running the rough boards through a planing machine, and in fact the rough boards are no doubt obtained of uneven thickness, so that this extra work is required before they become serviceable.

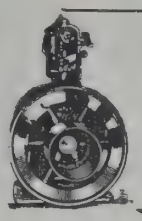
This ocatagon style of silo is certainly the cheapest method of building known so far. It is also easily erected, as all the angles are alike, being of 45 degrees, or half the square. All of the corner boards, on the eight corners, have the same bevel, so that they may be all bevelled at the same time and at leisure, and the bevel which fits one corner fits the other seven. The joists or "hoops" are also all of the same size, and may be cut from the pattern of one short one. They are not nailed together, and have to be raised with great trouble, as has the wooden round hoop. They are nailed at the corners as they are raised.

The octagon has every advantage that the circle has, in practically avoiding corners. The octagon is really a circle divided into eight parts. The construction of an octagon hoop is much simpler than that of a circle, and very much stronger. There is no danger of the octagon joist hoop spalling and bursting out at the ends as the built round hoop must certainly do unless fixed immovable by bands of thin iron on the ends where they meet. Then with the built wooden hoop, only narrow lumber can be used, not more than three or three and one half inches for a silo of 12 feet diameter, while with the octagon style of this size a double tier of rough boards with paper between, and of any widths can be used. An octagon silo of the kind here described can also be erected in half the time the circle can. The octagon style of silo only needs to be seen and seen building, to be appreciated. Everybody is welcome to build on whatever style he pleases, but the octagon style of silo is the cheapest and simplest style of silo that can be built today.

PAYING PATRONS OF CHEESE FACTORY.

That the straight butter fat method of paying patrons of cheese factories leads to conflict even in Missouri, there is no room for doubt. The plan of apportioning the dividends, as given by J. N. P., is certainly ingenious. Such a scale is just what is required to justly and fairly apportion dividends to the different patrons. This scale may not be just right, but no doubt it is proportional. By this scale the man supplying the 4 per cent milk does not receive one-third more than the man supplying the 3 per cent milk, which the straight fat method would do, and which Prof. Farrington would do if he were apportioning the dividends instead of J. N. P.

According to Prof. Farrington, the man supplying the 4 per cent milk would be paid for 12.2 lb. cheese, instead of 10.8, or one-third more than the 3 per cent man whose milk is supposed to have made 9.2 pounds cheese. An ascending scale of this kind is a very ingenious method of apportioning the dividends at the cheese factory with the Babcock test, and I heartily congratulate J. N. P. on his ingenuity in getting up and employing such a scale. The scale is truly proportionate, and will give justice to all kinds and qualities of milk. J. A. M.



P. E. I.

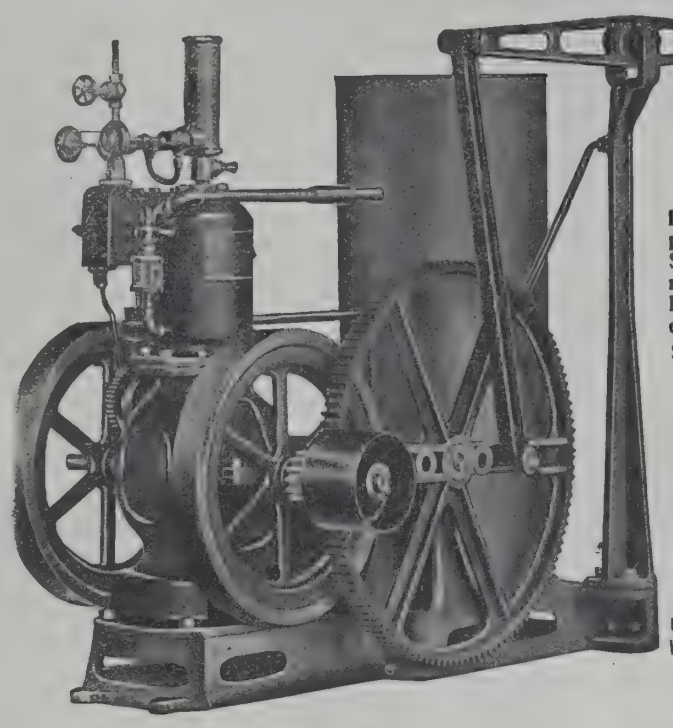
The Village Cow.

Many readers of the *Tribune Farmer* are residents of villages and are able to keep only a single cow, yet their garden, chickens and cow form a large portion of the support of the family. Hence, these villagers have an interest in the dairy.

Milk is a most important food, especially valuable where there are children. It can be used in many ways in cooking. If purchased it is expensive. It varies greatly in quality. Hence, when it can be produced it is an economy to produce it.

There are eight in our family. The children have never found much difficulty in disposing of all the milk one cow would give. At times we have kept two, but usually only one. With a good cow, this gives all the milk the family really seems to need. When the cow is fresh, a little can be sold to neighbors, which

The "Penny Wise and Pound Foolish"



Policy has an apt illustration in the man who buys a CHEAP gas or gasoline engine. Unreliable service, frequent and expensive repairs, wastefulness in fuel and short life offset many times over, the small saving in first cost. The "OTTO" is the original and BEST. Suppose it does cost a little more money, the extra dollars are well invested. 70000 users throughout the civilized world support us in this claim.

MILWAUKEE MACHINERY COMPANY, 290 East Water Street. Milwaukee, Wis.

nearly balances the cost of the milk purchased when the cow is dry.

After a number of years' experience, we are able to state our expense and income from the cow quite accurately. The last year she has done exceptionally well, and the expenses have been at a minimum. The following is the account:

Milk produced in eight months, 2,658 qts.	
at 6 cents	$159.48
Calf sold	9.80
Total receipts	$169.28
Cost for nine months' hay and fodder	20.00
Bran	10 00
Total expenditure	$30.00
Total profit	139.28

Some explanation as to feed is necessary. We rent a pasture, and then sublet a portion of it, reserving feed for our animal. This transaction brings our bill for rough feed to $20. For bedding we are able to get forest leaves without cost. We have an orchard, which furnishes all the apples the cow can safely eat from August to April, and some pasture in addition. The boys in the family do the work, as one means to keep them out of mischief. We have figured the milk at exactly what we would have paid for it. Except a very few days, we could have used more than we had. The excess, if any, has been fed to the chickens and returned as eggs.

In case there were not members of the family to do the work, it would be more convenient to buy the milk needed; yet there would still be the question of quality and purity, always to be considered when one wishes to care for health.

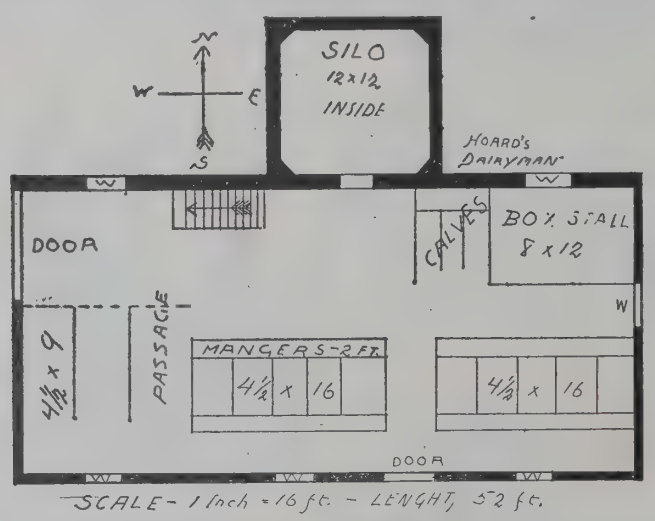
DR. GEORGE G. GROFF.

Lewisburg. Penn.

A Ten Cow Stable.

ED. HOARD'S DAIRYMAN:—I should like a little advice from you in regard to a dairy barn. I have a barn, 25x35 feet outside. What I want is to raise it up and put in a basemeut with wood bent on the south side. The barn will face the west and the cows face the south. How much room will I have to allow for 10 cows, 2 horses, and 2 calf stalls, and feed, stairs, etc? I will build on the east end as much room as needed. I don't care anything about driving through as I will have manure shed near and run the manure out in wheelbarrow. Please give me the proper width and length of stall for common Jersey cattle. My idea was to have cattle on the south side and have a door in the middle of same side so as not to carry manure the whole length. Where would be the best place for my silo, chutes for hay, etc? Also what about allowing for ventilation? The floor above basement will be, (or rather is) all open.

Earlville, N. Y. H. B. C.



We are always glad to answer as best we can all inquiries, and especially such as may be of more than personal interest. There are doubtless many 10-cow dairymen among our readers who may be contemplating a re-arrangement of their stables, and the suggestions submitted in reply to H. B. C. may be of some help to them. It is not to be expected that we can cover every phase of convenience without knowing something of the relation of the barn to other buildings and the multitude of little things which differentiate one situation from all others.

H. B. C. says his barn will face the west, which means, we suppose, that he will habitually enter and leave the barn at its west end, and probably take in his hay at that end. If this is the case, he should arrange to take out the hay from that end first, through a chute or trap door not far from the northwest corner, or just beyond the landing at the top of the stairway. Later on, as the hay is fed out, another opening further back could be used which would deliver the hay in front of the silo.

Under the conditions named, we would face the cows towards the north, in the center of the stable. Such an arrangement will be more convenient both for feeding and removing the manure, as well as giving the cows more direct access to their stalls and keeping the main part of the stable much cleaner. For similar reasons we locate the horses in the southwest corner, with a passage way from the center, which may also be used for a third horse in case of emergency. A door leads from the rear of the horse stalls into the cow stable, for facilitating the removal of litter or manure.

We also specify a box stall, as no stable for 10 cows can otherwise be considered complete.

There should be a tight floor above the stable, no matter what other things are omitted, as in no other way can the stable be kept comfortably warm in winter. The matter of ventilation has been so fully discussed recently that it does not seem necessary to go over that subject again.

Seeing your friends and having them join in for a good club of subscribers.

New York Bulletins on Cheese Ripening.

The problems which confront the cheese maker are among the most perplexing of any relating to agricultural practice. He must not only provide against various contingencies and defects which affect the curd before it is placed on the curing shelves, but must also, in the manufacture, lay the foundation for a series of complex chemical and physical transformations, from which arise the perfect texture, the nutty flavor and the easy digestibility of well-made and well cured cheese. In these processes both inanimate and animate forces are at work, and their character, amounts and interactions materially influence the character of the cheese. It is, consequently, upon knowledge of these agencies and their relations that scientific explanations of the processes of cheese making and cheese ripening depend; and this knowledge can only come through long, careful and deep study.

Such investigations have been in progress for many months at the New York Agricultural Experiment Station (Gene-

$13.75 buys Sweep Grinder. We have 7 styles and sizes. Crushes and grinds ear corn coarse or fine, shelled corn, wheat, rye, barley, kaffir corn, etc. singly or mixed. **Special Inducements Now.** Write for circular, "Feeding Experiments."

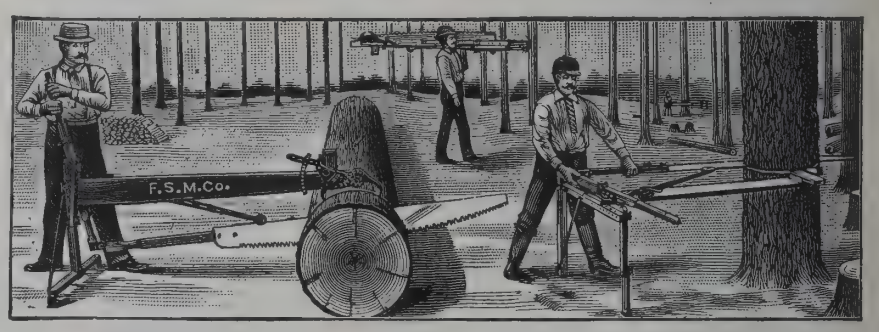
ILLUSTRATION

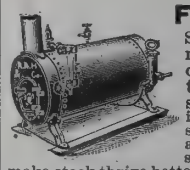
A FEED MILL GUARANTEE.

The subject of this illustration is the New Holland Cob and Feed Mill, manufactured by the New Holland Machine Works, New Holland, Pa. It is one of the mills that depends on its own work to sell it, and is therefore, freely sent forth to responsible parties on trial. With the opportunity to make test of its worth at the buyers own home goes a remarkable guarantee of the manufacturers, which shows the faith they have in its adaptability and superior working qualities. This guarantee says that it may be tested freely on ear corn, shelled corn, small grains and all feed stuffs, and that it must establish the fact to the proposed buyer's satisfaction that it will do the work "easier, better and faster than any other mill." Failing to sustain such a broad challenge, it is no sale, and the mill can be returned at the Company's expense.



This broad guarantee covers most satisfactorily just those things required in a feed mill. It does not seem possible for one to go wrong with the added opportunity to put it to the test. It is made in three sizes, and is adapted to the use of any kind of power.

Anyone contemplating the purchase of a feed mill, should at least send for this Company's catalog and make investigation before placing an order.



ILLUSTRATION

THE WOOD CUTTER'S MACHINE.

The man who follows the time-honored custom of sawing wood will find a piece of machinery that will save him great labor in the Folding Sawing Machine pictured here. It is manufactured by a company of the same name in Chicago and is regularly advertised in our columns. This

machine takes the place of the old time cross-cut saw. It can be used in any situation where the cross cut can be used, and its great value is seen in this, that one man can saw more wood with it than two men can with the old cross cut saw. It has a record of nine cords of wood in a single working day by one man. It is not only adapted to sawing felled trees, but to sawing down trees. It is so adjusted that the operator is not at all discommoded whether working on the fallen log, the standing tree, on the hillside, etc. By a spring adjustment it is made to suit the strength of a boy as well as a man. Sawing with it is not a back-breaking performance, for the operator always stands straight. Easy and fast sawing by one man alone in all locations are strong inducements to its use, but it has others. When through with one job it can be folded up in compact form, "like a jack knife," placed on the shoulder and carried off to other work. It is perfectly adapted to the needs of the tie chopper, cordwood and saw log man, cutting posts, rail timber, etc. The blade is of the best saw steel. The whole machine, though small and light, is staunch and well made out of select materials. Any one interested should consult the advertisement elsewhere for correct address and write the company for catalog and full information.

FEED COOKERS Steam can be got up in ten minutes, and will cook a kerosene barrel of meal, or potatoes in 20 minutes. Will steam quicker with less fuel, is better built, more durable, safer, easier to operate than any other on the market. Will save one-third of feed, and make stock thrive better. To introduce, one at wholesale price where we have no agents. Prices and catalog free. R. R. HOWELL & CO., Minneapolis, Minn.

$1800.00
MADE IN FOUR DAYS.

ONE of our agents, a Baraboo man, made $1800.00 in four days; an Oshkosh man made $600.00 in two days. We can furnish a few parties a very paying business; choice locality.

We have an article of interest and value to every farmer. Investigation invited. Best bank reference. Write at once for particulars. BUTLER BROS., U. S. Agents. Beaver Dam, Wis.

va), and the results, as announced in various bulletins of the station, have excited great scientific interest.

These various bulletins have now been condensed in a "Popular Edition," in which the principal points of general interest developed in the study are stated in simple terms. This bulletin should be carefully studied by every cheese maker; for while it may not indicate new or revolutionary methods in cheese making, it gives the first satisfactory "Reasons Why" of many points in cheese manufacture and curing.

The bulletin, "Some Changes in a Ripening Cheese," will be sent free to all applicants.

Freezing the Test.

Please inform me what effect the freezing of the test bottles will have on the test of the butter fat. I saw in our co-operative creamery at Fennimore that the test bottles were frozen solid.
Fennimore, Wis. R. D.

Freezing the milk in the bottles should have no influence on the test, if the milk is thawed out before the test is made.

CONCERNING OUR ADVERTISERS.

PREPARE FOR THE ICE HARVEST.

The appearance in our columns of advertisement of ice harvesting machinery, suggests the propriety of a timely warning. The ice crop must be taken care of in its prime. Frequently there are but a few days in which to harvest it. With this crop, more than any other, perhaps, there is necessity of having all things in readiness. Happily there are modern machinery and appliances which now make rapid harvesting an easy matter. A copy of the catalog of ice harvesting and handling machinery of the Ames Plow Company of Boston, is before us. One cannot escape the conclusion that it shows machinery and devices that are especially well adapted to every branch of the ice business. The famous Red, White and Blue Ice Plows are a central figure. Prominent mention is made of these in the advertisement. But every other contrivance, it would seem, that pertains to the ice handling business, is shown in this book. There is nothing better made or more perfectly adapted to the work than the tools of this company. We urge readers, who will be harvesting and handling ice, to send now for this catalog, before the ice making weather sets in. It is mailed free. It will show plainly the best, fastest and most economical means of handling ice. It may put you in the way of saving a valuable crop you have heretofore neglected, and one for which every year sees more demand, either in the sale of the product itself, or for use in the preservation of other more valuable products.

FARM TELEPHONES.

The day is not far distant when the rural districts of this country will be as completely covered with telephone systems as are the cities today. Progressive farmers, ranchmen, and fruit growers are taking an active interest in telephones and they are eagerly seeking knowledge on the subject. The Julius Andrae & Sons Co., of Milwaukee, Wis,, one of the largest manufacturers of telephones in the world have just issued a book containing full and complete information on telephones. They advise us that a copy of this book will be sent free of any charge to those of our readers who are interested in the subject. The book can be secured by addressing the Julius Andrae & Sons Co., at their Milwaukee Office, 450 West Water St.

VETERINARY.

Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

Heaves.

Do you know of any cure for heaves in a horse, or a remedy? State whether it is a cure or only a releief. Also tell me a good way to fatten a horse? W. A, O'M.
St. Paul, Minn,

ANSWER.

If heaves are not of longer standing than two or three weeks, they can be permanently cured by abstaining from hay and straw as much as possible, thereby giving the lungs more room. A horse with heaves is always inclined to overload his stomach which diminishes the lung capacity, therefore this must be avoided. Give the horse ½ oz. Fowler's Solution of Arsenic in food twice daily and slightly increase the dose each week up to a full ounce; keep this up until relieved.

No. 2 To fatten a horse you must first of all see that his teeth are right, then look after the digestive organs and when these are in good order, begin to increase your grain ration and see that you do not overtax the digestive organs, always keep the bowels open by giving an occasional bran mash and salt.

Obstructed Quarter.

I have a Jersey cow, in calving some time ago got a very bad gathered udder, and I had a veterinary to lance same near one of the back teats, and since then have been unable to get any milk out of this teat. Do you think a teat bistoury would be of any assistance? If so, please advise, and I will remit for one.
Frederick, Maryland. J. R. McS.

ANSWER.

If you can induce the milk to flow with a long milking tube the bistuory will emedy your case, otherwise the obtruction is too high to reach.

Retention of Placenta.

For the benefit of a Massachusetts subscriber, please give a brief, but comprehensive description of the methods to be pursued in removing the afterbirth in cows, which do not expel it normally. B.

ANSWER.

When a cow retains her placenta, it should not be allowed to remain so for more than forty-eight hours. There are within the uterus, attached to its walls, from thirty to forty cotyledons, commonly termed buttons, over which the placenta is attached. Introduce your hand into the uterus and manipulate each one of these cotyledons with your fingers, in such a manner as to separate the placental membranes from these cotyledons. Continue this operation until all have been separated. Then pull gently with the other hand, helping with the one inside. Never tear off any of the membranes nor any of the cotyledons. When all of the placenta has been removed, you may flush the uterus with a ½ per cent solution of permanganate of potash in warm water. The water should never be cooler than the body temperature.

Failure to Come in Heat.

How can I bring a cow in heat? She has not been that way for two years. Is about 10 years old; a fine full blood Jersey cow. H. C. A.
Maitland, Fla.

ANSWER.

Give the cow 1½ ozs. of powdered aloes dissolved in a quart of warm water. Drench at one dose. Repeat this in a week and continue your nux vomica. After this give the cow a chance to show when she comes in heat, by allowing her to be in company with other cows, or try her once a week by letting the bull coax her. Sometimes they come in heat and do not show it only for a short time. Watch her closely.

Warts.

Jersey heifer has got warts all over her (bag, ears, legs). They look like the inside of a cow's stomach. Do you think better to do away with the animal? Is this a contagious disease?
Florida. A. VANE.

ANSWER.

Clip off the warts with a sharp pair of scissors and touch up the parts with a stick of lunar caustic.

Bloody Stools.

Please inform why my cows have blood in their voidings. SUBSCRIBER.
Manchester, Vt.

ANSWER.

This is due to constipation. Keep the bowels open and this will be done away with.

Abortion.

1 have had four cows abort this season and am afraid my whole herd is infected; have seventy head and all will be in between now and March 1st. Two of the abortions were very small and two were about six or seven months along. Herd seems to be in good heath generally. R. F. H.
Ohio.

ANSWER.

See abortion, last issue.

Garget.

We have two cows with badly caked udders.
Howell, Mich. J M.

ANSWER.

Give the cows each an ounce of acetate of potash and ½ ounce of fluid extract of poke root in a quart of warm water twice daily as a drench, and rub the udder with the following ointment after milking, twice daily: Iodine resublimed, 1 oz.; lanolin, 16 ozs. and apply warm with plenty of hand rubbing.

Horse Owners! Use GOMBAULT'S Caustic Balsam

Program for the 12th Annual Meeting of the Wisconsin Cheese Makers' Association.

ED. HOARD'S DAIRYMAN:—I am pleased to report that the advanced sheets for the program of the 12th annual meeting of the Wisconsin Cheese Makers' Association to be held in Milwaukee, January 6th, 7th and 8th, 1904, have gone to the printer.

Headquarters will be at the Republican Hotel where club rooms for the daily sessions and for the cheese exhibits have been secured. Special accommodations are assured all visiting delegates. Transportation at reduced rates for the round trip to Milwaukee and return will apply to all points in the state.

The program includes addresses of great interest, not only to practical cheesemakers, but also to patrons and dairy farmers. The fancy or foreign cheese interests of the state will receive especial attention.

A part of the many good features in store for the cheesemaker is hereby announced:

Cheese Making in Ontario and Instruction in Cheese Factories in Western Ontario, Prof. G. H. Barr, Chief Instructor for Western Ontario, Strathroy, Ontario.

Address, Sidney C. Thompson, Maine State Dairy and Food Commissioner, Winterport, Maine.

Laws Relating to Clean and Sanitary Conditions in Cheese Factories, Professor. J. Q. Emery, Wisconsin State Dairy and Food Commissioner, Madison, Wis.

The Factory Operator an Organizer for the Betterment of Rural Communities, Prof. R. A. Moore, Agronomist, Wisconsin Agricultural Experiment Station, Madison, Wis.

United States Department of Agriculture, Represented by Mr. W. D. Collyer, Chicago, Ill.

The Cheese Maker and the Patron. C. H. Everett, Editor *Wisconsin Agriculturist*, Racine, Wis.

Some Things Outside the Cheese Factory, Prof. F. G. Short, Fort Atkinson, Wis.

Address, E. J. Piggott, Chicago.

A Few Stray Thoughts, W. C. Thomas, Sheboygan Falls, Wis.

Economy in Marketing Cheese, H. J. Bamford, Plymouth, Wis.

The Paraffining of Cheese, H. J. Noyes, Muscoda, Wisconsin.

Cheese Factory Accounting, Frank Dewhirst, Madison, Wis.

Benefits of Septic Tank, M. Michels, Garnet, Wis,

Benefits Derived From Using the Automatic Curd Agitators, H. M. Scott, Sheboygan Falls, Wisconsin.

The Cheese Makers' Association as an Educator, R. A. Murray, Yuba, Wisconsin.

Preparation and Propagation of the Pure Commercial Culture, W. A. Austin, Spring Green, Wis.

The Manufacture and Sale of Fancy Cheese in Wisconsin. Carl Marty, Brodhead, Wis.

Hints Upon the Construction of Cheese Factory Buildings, U. S. Baer. Madison, Wisconsin.

Discussion: What is a Fair Compensation for Making Cheese?

A number of speakers whose names do not appear in this announcement have been invited and will be heard during the various sessions. After the reading of each paper all persons present are requested to ask questions and discuss thoroughly the articles read.

Something entirely new as applied to cheese scoring in the way of a numerical and descriptive score card has been prepared. The services of an expert cheese instructor have been secured to follow the work of the judges, and take notes of the points criticised by them. From the data thus secured, in connection with the method of manufacture as reported on the entry blanks, he will point out in a personal letter to the exhibitor the faults and defects, if there be any, and offer suggestions and instructions whereby such defects may be overcome and avoided in the future.

This educational cheese contest is open to the world. Every exhibitor must be a member of the Association. One dollar secures a membership.

Following is a list of contributors to the premium fund; the list is not yet complete:

Colonial Salt Company, Akron, Ohio	$25.00
Creamery Package M'fg. Co , Chicago, Ill.	25.00
Wisconsin Dairy Supply Co., Whitewater, Wis	15.00
Chr. Hansen's Laboratory, Little Falls, N. Y.	10.00
Monarch Refrigerating Co., Chicago, Ill.	10.00
The Preservaline Manufacturing Co., Chicago, Ill	10.00
J. and M. Steiner, Milwaukee, Wis	10.00
Worcester Salt Co., New York, N. Y.	10.00
Sturges & Burn Manufacturing Co., Chicago, Ill	10.00
Francis D. Moulton & Co., Chicago, Ill	10.00
Republican Hotel, Milwaukee, Wis.	10.00
Sharples Separator Co., West Chester, Pa.	10.00
Wells & Richardson Co., Burlington, Vt.	10.09
Diamond Crystal Salt Co., St. Clair, Mich	$10.00
E. A. Roser & Co., Chicago, Ill.	10,00
A. H. Barber Supply Co., Chicago, Ill.	10.00
A. H. Barber Co., (Wholesale Cheese and Butter) Chicago, Ill	10,00
J. B. Ford Co., Wyandotte, Mich,	10.00
De Laval Separator Co., Chicago, Ill.	10.00
Dundas Wooden Ware Co., Dundas, Wis.	10.00
M. H. Fairchild and Brother, Chicago, Ill.	5.00
A. J. Decker, Fond du Lac, Wis.	5.00
John Muir, Chicago, Ill.	5.00

The program now in the printer's hands, will give complete instructions to exhibitors and also will give a complete list of premiums. Entry blanks and any information in regard to hotels, transportation, etc., will be gladly furnished upon application.

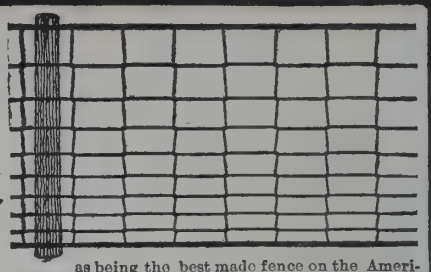
Is Barley a Good Feed for Milch Cows?

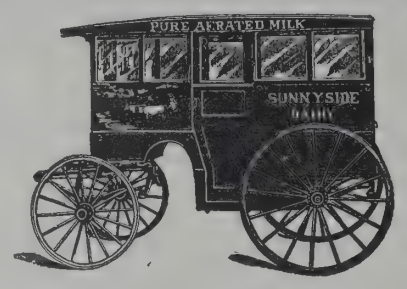


ED. HOARD'S DAIRYMAN:—I saw in your paper of Nov. 20, an answer to H. B. A., of California, to try ground barley with alfalfa hay. I am not an experienced dairyman, but have tried ground barley on six milk cows and they decreased about two quarts of milk to the cow at a milking and decreased ½ lb. of cream at each skimming, as I use a separator. I find the best results from bran and shorts mixed half and half and plenty of alfalfa. I feed this to my cows all the year round and get more from my cows than with ground barley, and the cream tests better at the creamery with shorts and bran than barley. E. F. A.

Payette, Idaho.

While we are much obliged to our Idaho correspondent for this report of his experience with barley we hardly feel justified in accepting it as a conclusive condemation of barley as a complement to alfalfa hay for milch cows. Doubtless other readers of HOARD'S DAIRYMAN in the sections where alfalfa has been fed for several years have had experience with barley and we should be much gratified if they would favor us with reports.

LET US POINT OUT A GOOD FENCE



If you are going to buy any fencing this season, it is important that you buy the best fence on the market, and that you buy it at the Right Price. WE POINT OUT OUR

Advance Fencing

as being the best made fence on the American market. It has a continuous stay wire which is woven into the top and bottom strands from one stay to the next without leaving any loose ends. The stay wire cannot slip or slide on the horizontal strands. We have a Free Fence Book, which tells all about our twenty-three different styles of ADVANCE FENCING, a fence for every need on the farm. This book also tells how we sell our ADVANCE FENCING direct to the farmer, giving him the advantage of the dealer's and jobber's profits. It also tells how we sell Advance Fencing on 30 Days' Free Trial which gives you ample opportunity to be absolutely satisfied that you are getting just what you want. We Pay the Freight. This enables you to know just what the fencing is going to cost laid down at your railroad station. It is the fairest fence offer ever made by anyone anywhere. Send for our FREE FENCE BOOK and find out all about ADVANCE FENCING and our liberal offer before purchasing. Write for it at once. DO IT NOW.

ADVANCE FENCE COMPANY, - 33 H Street, Peoria, Illinois.

Oleo Law and Butter.

The Effect on the Market as Observed by the Grocery World.

In an article, by the *Grocery World*, Philadelphia, on "What the Federal oleo law has done for the butter market," it states the situation as that paper observes it as follows:

The federal oleo act of 1901, under which colored oleo is taxed 10c per pound, has undoubtedly been a godsend to the butter market for the last year at least. For the practical elimination of oleo as a competitor of butter has enabled the butter people, in a year of tremendous production, to keep their prices up several cents above what they would have been with colored oleo freely in the market.

The make of butter has been enormous for the last two years, and there has been some glut, but nothing like what would have come had the sale of oleo been unrestricted. As a matter of fact, the price of butter for the last two years has been so much above the price of other exporting countries that American butter has had no export outlet, and this has naturally increased the domestic supply. These high prices have not been wholly caused by the elimination of oleo, as one direct factor has been the high price of milk, caused by the demand from the condensaries. The falling off in the sale of oleo, however, has unquestionably had much to do with it.

The recent federal act and other causes have greatly changed the complexion of the butter market in the last two years. In the large cities a great horde of peddlers who formerly sold oleo are now forced to sell butter. They are after the cheaper grades, and this has caused activity in those.

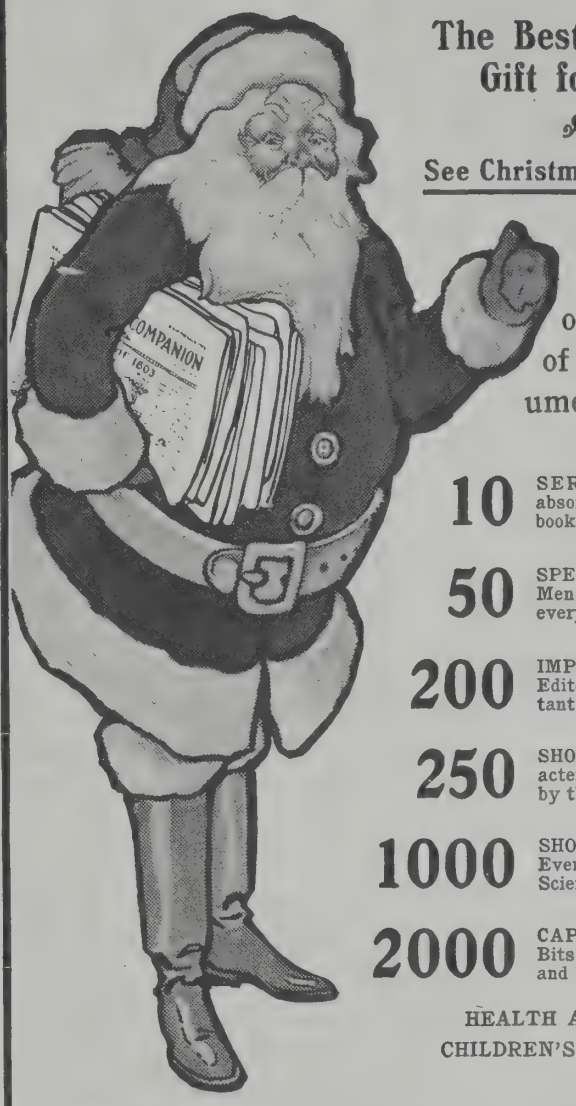
Another change which is worthy of note is the decrease in the production of dairy butter, which is the sort of butter made by farmers and turned in to the country stores to be sold. The concerns that sell separators have placed them in the rural districts all over the country. With a cream separator the farmer no longer turns his cream into butter, but separates it and ships it away to some creamery. This in turn has caused a local demand for creamery butter since there was little or no dairy butter, and a large number of creameries are not shipping to the large markets, but are disposing of their production locally. Dairy butter, it is to be said, invariably sold cheaper than fine creamery, and the absence of it also strengthens the creamery market.

To come back to the effects of the oleo law, the prices of butter would have almost surely been lower had the act referred to not been passed. As it is, the heavy production has forced prices to a point 2c or 3c lower than a year ago, but a plane lower yet—probably much lower yet—would have been reached had the enormous make of butter had to compete with the usual quantity of yellow oleo.

The butter market last June was higher than supply and demand would have made it, but this was by reason of speculation and the fact that the season was three weeks late. Since June, however, the conditions have been more normal, and prices have kept a lower level.

The make of butter was so heavy last summer that there is an enormous quantity of butter in cold storage, which will have to be consumed some time. There was also large storings in June, but at such a high price that the present market will not allow it to be withdrawn.

Apple Pomace for Feed.



ED. HOARD'S DAIRYMAN:—How many of the DAIRYMAN'S readers are aware that the by-product of the cider mill is an excellent dairy feed, ranking with corn ensilage, beet pulp and roots?

I first became interested in it a year ago, when a neighbor living much further from the mill, bought the entire fall's make for almost a song, drawing it every day as made, and packing in a bin in regular silo fashion.

On inquiry, was told that it lasted thirty head of cattle until the middle of February, fed once a day in conjunction with silage and hay, and that the cows not only did well, but preferred it to silage or even grain. The latter assertion, to tell the truth, rather staggered me, but have found by actual experience that it was really so.

This fall I secured one-half of the pomace made at a neighboring mill, and drew my first load October 12. From

Factory Loaded Smokeless Powder Shells.

It's not sentiment — it's not the price — that makes the most intelligent and successful shots shoot Winchester Factory Loaded Shotgun Shells. It's the results they give. It's their entire reliability, evenness of pattern and uniform shooting. Winchester "Leader" shells, loaded with smokeless powder, are the best loaded shells on the market. Winchester "Repeater" shells loaded with smokeless powder are cheap in price but not in quality. Try either of these brands and you will be well pleased. Be sure to get Winchester Factory Loaded shells.

THE SHELLS THE CHAMPIONS SHOOT.

that date until November 10, I fed it twice a day to twenty cows, one-half bushel per cow to a feed. Since the tenth have fed it once daily with corn ensilage and hay, with a grain ration of bran and gluten, and never have my cows done better.

The stock relish it greatly, and when grain is poured upon it, will eat the pomace first.

Pomace is very heavy, and half a bushel is plenty for any cow, and that much should not be given at first. Start with a small shoveful and gradually work up.

Another thing that I have learned, surprised me, the cows seemed to relish it more after it had been well settled in the bin, and fermented or steamed a week or more, than fed fresh from the mill, which is contrary to most reports; have always supposed that it was much better fed fresh.

As for milk, it is the equal in my opinion of good ensilage, but probably no better;but providing it has not to be carted far, and can be bought reasonable, as it usually can, it makes a very cheap, palatable and healthy food.

Well, some one will say, "I don't need it, as I have plenty of good hay and ensilage." That may be true, but is it policy to feed a high-priced ration simply because you have got it and would have to buy a cheaper one; or would it be any crime if you had a few tons of nice clover hay left over next spring, or a few feet of good ensilage to feed next summer when the pastures get short and dry?

Indeed, it seems to me that this might come under the same head as the DAIRYMAN'S policy in advocating the selling of high priced home grown grains and buying the cheaper brans and glutens, for it is what every farmer is, or ought to be striving for to produce the most milk at the least cost, and in this matter the roughage part of the ration should be considered as well as the grain.

N. Y. H. J. K.

Holstein Cows at the World's Fair.

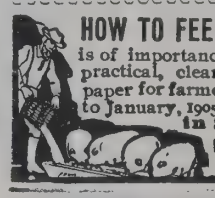
The Holstein-Friesian breed of cattle is to be creditably represented at the Universal Exposition of 1904 in the Demonstration of Cows. The recent organization of the World's Fair Holstein-Friesian Association,having for its sole object the assembling of the best cows of this popular dairy breed at St. Lonis for participation in the competitive demonstration will undoubtedly insure a showing most satisfactory to the entire dairy industry and especially to the confident advocates of the Holstein-Friesian.

The World's Fair Holstein-Friesian Association is composed of men who have attained a high degree of success as representative exhibitors and breeders. Its officers have filed with the Exposition,application for the entry of their animals, and a barn with all conveniences for the care and comfort of the Holstein-Friesian cows taking part in the Demonstration will be provided by the Exposition.

The following address to Holstein breeders will soon be sent by the association to all likely to be interested in placing cows in the World's Fair Demonsration:

To the Breeders of Holstein-Friesian Cattle:—The Holstein-Friesian breed of cattle certainly ranks second to none of the dairy breeds in the matter of large flow of rich milk and in the beef-making qualities. The butter and beef records made by the Holstein-Friesian cow demonstrate her great value as a dual-purpose breed of cattle. She stands without a successful rival in large and continued flow of market milk, and when judged for quantity and quality of milk of a given standard she heads the list. Her popularity as a profitable producer of cheese has made her a leading favorite wherever tested under favorable conditions.

The butter record is held by a Holstein-Friesian cow, and there will be cows at the World's Fair that will make a new mark for the breed. The recognized Queen of the Dairy is not lacking in friends who have the fullest confidence in the ability of the Holstein-Friesian to make the most favorable comparison at the World's Fair with any of the dairy breeds, either as a producer of milk, butter, cheese,or as a dual-purpose breed.



A successful exhibit of the Holstein-Friesian breed of cattle in the Demonstration of Cows at the Universal Exposition of 1904 will more than double the value of every good specimen in public estimation. The owners of exceptionally good cows cannot demonstrate their faith in this grand breed to better advan-

FARM LANDS FREE Send stamp for circulars and information. Address J. LOVERING, Mgr., G 508 Germania Building, St. Paul, Minn

Buy You a Ticket to CROOKSTON, MINN., and call upon

The Polk County Land & Loan Company

For Choice Red River Valley Farms. They pay railroad expenses if you buy from them. A few good bargains.

360 acre farm, 4½ miles from Crookston, Minn., a city of 7,000 inhabitants, and 2½ miles from the State Experimental Farm. This is a photograph of the buildings as they are today: House is 16x24 1½ stories with an L 14x22, and a wood shed in connection 20 feet square, all on a brick foundation. Barn 28x48, with a lean to 16x48, sheeted both inside and out. Two granaries, one 14x80, and the other 14x42. The buildings are all well painted and in very good repair, and has a fine artesian well. Every acre of this farm is under a high state of cultivation, and is well drained by a slight ravine running through the farm merely sufficient for self drainage. The soil is a rich, deep black loam with a clay sub-soil, and in every respect is considered to be one of the best farms in that vicinity. Our price on this farm is $35.00 per acre.

This is a 320 acre farm about 2½ miles south of the city, this farm is quite well improved, has a very good house of about seven rooms, 1½ stories, barn large enough for ten head of horses, also a good granary, pasture and an artesian well, also has a good well at the house, good grove around the building, This is a very choice piece of land for the price $32.50.

160 acres north-east of the city; this is all hay land, and located in a German settlement, the surrounding country is nearly all under cultivation; we consider this a good piece of land for an investment, this could all be put under the plow, if desired. Price $19.00 per acre.

"ADVERTISEMENT."

THE VALUE OF CHARCOAL

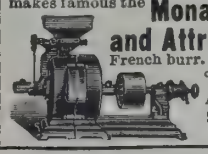
Few People Know How Useful it is in Preserving Health and Beauty.

Nearly everybody knows that charcoal is the safest and most efficient disinfectant and purifier in nature, but few realize its value when taken into the human system for the same cleansing purpose.

Charcoal is a remedy that the more you take of it the better; it is not a drug at all, but simply absorbs the gases and impurities always present in the stomach and intestines and carries them out of the system.

Charcoal sweetens the breath after smoking, drinking or after eating onions and other odorous vegetables.

Charcoal effectually clears and improves the complexion, it whitens the teeth and further acts as a natural and eminently safe cathartic.



It absorbs the injurious gases which collect in the stomach and bowels; it disinfects the mouth and throat from the poison of catarrh.

All druggists sell charcoal in one form or another, but probably the best charcoal and the most for the money is in Stuart's Absorbent Lozenges; they are composed of the finest powdered Willow charcoal, and other harmless anti-septics in tablet form or rather in the form of large, pleasant tasting lozenges, the charcoal being mixed with honey.

The daily use of these lozenges will soon tell in a much improved condition of the general health, better complexion, sweeter breath and purer blood, and the beauty of it is, that no possible harm can result from their continued use, but on the contrary, great benefit.

A Buffalo physician in speaking of the benefits of charcoal, says: "I advise Stuart's Absorbent Lozenges to all patients suffering from gas in stomach and bowels, and to clear the complexion and purify the breath, mouth and throat; I also believe the liver is greatly benefitted by the daily use of them; they cost but twenty-five cents a box at drug stores, and although in some sense a patent preparation, yet I believe I get more and better charcoal in Stuart's Absorbent Lozenges than in any of the ordinary charcoal tablets."

FAST GRINDING of family meal or ear corn and grains makes famous the **Monarch French Burr and Attrition Mills.** Genuine imported French burr. None to compare in speed or character of work is the guarantee.

It Concerns You

to know what happens to your butter on its way to the consumer's table. It's likely to encounter enough noisome smells in commission house, storage cellar and shop to ruin your reputation. There's safety in

Pioneer Brand
Parchment Paper.

A pure vegetable parchment which holds the delicate flavors in and shuts the foreign odors out. Don't confound it with common or so-called parchments. The Pioneer has no taste or smell of its own to impart and your butter stays sweet as a nut. **Sheets for print wrapping, rolls for box linings, circles and linings for tubs.**

Your name or brand on wrapping sheets is good advertising. It will not come off to discolor the butter if we print it. Let us send you sample sheets and copy of book, "Better Butter."

37 Eighth St., Passaic, N. J.

THE PATERSON PARCHMENT PAPER CO. PASSAIC, N.J.

Watch for the Pioneer Trademark.

tage than by sending them to take part in the Demonstration of Cows at the World's Fair. One of the best barns ever constructed for the exhibition, comfort and care of dairy cows has been provided by the Exposition for the accommodation of the Holstein-Friesian herd.

All the products of the cows in the Demonstration will belong to the contributors of the cows, which will leave little, if any, expense to the owners, who will find the value of each cow increased many fold, while the advantage of the wide advertising the herds participating will receive, cannot be computed.

The Holstein-Friesian breed can be represented at St. Louis next year with twenty-five cows that can make new records in every test provided. The owner of every superior Holstein-Friesian cow bred to calve in April, 1904, who is interested in promoting the best interests of the breed through the best agency ever provided, is requested to advise the Secretary of the World's Fair Holstein-Friesian Association at the earliest possible date. The Universal Exposition of 1904 provides the most auspicious occasion for exploiting the excellences of the Holstein-Friesian breed, that has ever or will be presented to the American breeder.

The champions of the breeds claim the Holstein-Friesian cow the best for all dairy purposes, while our competitors are crowding every available publication with the challenge for the Holstein-Friesian advocates to either "put up or shut up."

Let every breeder of Holstein-Friesian cattle from this time forward, widely publish the fact that the World's Fair Holstein-Friesian Association has accepted the challenge and will "put up" and continue the contest and effectively "shut up" all the avenues of adverse criticism.

Manure Cisterns.

ED. HOARD'S DAIRYMAN:—We are remodeling our dairy barn at the institution and intend putting in cisterns for liquid manure. How much capacity would you advise, say for 100 cows? Would you construct them much like an ordinary cistern?

I have just been looking through the advertising columns of your paper to find something advertised to haul the liquids to the fields, but fail to find such. How large should the holes be made in the perforated plate at the point where the liquid leaves the gutter? What information you can give me will be gladly received. D. M. A.

Lawrence, Kans.

You may estimate the liquid voided at from 2½ to 3 gallons from each cow daily which will amount from 8 to 10 barrels per day from 100 cows. We can give no estimate as to how frequently the contents of the cistern can be removed under the conditions attaching to your environment. And having had no experience in such matters, we are unable to advise definitely as to the size of mesh in the plate at the end of gutter, but it is apparent that much will depend upon whether any considerable amount of the solids and litter are carried forward with the liquid, and this in turn will depend a good deal upon the care and attention given the matter, by the stable attendants. If we were installing such a system, we should provide at least two strainers, the first with comparatively large openings to arrest the coarser matter, and the second with smaller openings. In addition, it will be expedient to provide a large opening into the cistern through which the "settlings," could be removed.

Perhaps some of our readers with experience in disposing of liquid manure in this way, may be able to give more definite information and if so we shall be gratified to hear from them.

THE $60,000

DAN PATCH 1:56¼

CHAMPION HARNESS HORSE of the WORLD

EATS

3 FEEDS FOR ONE CENT

EVERY DAY.

"International Stock Food" greatly aids Digestion and Assimilation so that More Nutrition is obtained from all grain eaten. It "tones up" and Permanently Strengthens the entire system and Purifies the Blood so that disease is prevented. Every $3.50 pail of "International Stock Food" is positively guaranteed to save $7.00 worth of grain. It will cause your Race Horse to have more speed and endurance. It will make your Carriage Horses healthy, fat and beautiful. It will give your Show Horses more life and action and make them glossy. It will make your Work Horses strong, healthy and of great endurance. It will make your Stallions and Brood Mares surer, and your colts will be better and grow and develop more rapidly. "International Stock Food" is absolutely harmless even if taken into the human system. It is prepared from Roots, Herbs, Seeds and Barks and is fed in small amounts as an addition to the regular grain allowance. It is equally profitable when fed to Horses, Cattle, Sheep, Hogs, Colts, Calves, Lambs or Pigs. It will make you a large extra profit when fed to your stock for Growing, Fattening or Working. It will increase milk 15 to 25 per cent. in Cows, Mares, Sows or Ewes, and only costs 3 FEEDS FOR ONE CENT. A Dan Patch colt commanded $5,000 at eight months of age. He looked like a yearling and was beautiful, strong and vigorous. The dam was fed "International Stock Food" before and after foaling, and the colt as soon as it would eat. Dan Patch became the World's Champion Harness Horse nine months after commencing to eat "International Stock Food" every day. If it is good for such horses don't you think it would pay you to test it on yours? Our "International Stock Food Farm" contains 650 acres, 12 miles from Minneapolis, and on it we own Dan Patch 1:56¼, Directum 2:05¼, Roy Wilkes 2:06½, and a band of brood mares. They all eat "International Stock Food" every day. BEWARE OF IMITATIONS and SUBSTITUTES. There are many worthless imitations on the market, put out by people who seem to think that the way to start a business is to steal as much as they can from some prominent firm. No chemist can separate and name all of the ingredients used in "International Stock Food," etc., and any chemist or manufacturer claiming to do so must be an Ignoramus or a Falsifier

A BEAUTIFUL DAN PATCH PICTURE FREE

We have a very fine, large lithograph of Dan Patch with the great driver, M. E. McHenry, in sulky. This Lithograph, Printed in Six Brilliant Colors, is one of the finest and most attractive horse pictures ever published. It is 21x28 and printed on heavy paper suitable for framing.

International Stock Food Co.

MINNEAPOLIS, MINN., U. S. A.

THE SMALLEY SHREDDER

HAS NO EQUAL.

It gives fodder the greatest food value, and makes it easier for the animal to masticate and digest. Requires least power; strong and durable; will outlast a dozen of the saw pattern kind. Knives adjustable to compensate for wear. We can furnish snapper rolls to remove all the ears, just the same as a husker. This combination of cutter, shredder and snapper, costs but little more than the ordinary cutter. We also make drag and circular saws, sweep and tread powers, and ensilage cutters with carriers or blowers to reach any silo. Our free catalogue tells all about our goods. Address Box No. H

SMALLEY MFG. CO., Manitowoc, Wis.

FEED GRINDERS AND COOKERS

Most perfectly adapted to wants of feeders. Feed goes twice as far and makes better beef. Our

Giant Killer Triple Geared Feed Mill

is the fastest sweep mill made. Light running and grinds ear and shelled corn and all grains coarse or fine. Strong and durable.

Northwestern Steam Cooker

leads all others. Return draft, quick steaming, large capacity. Don't buy either mill or cooker without seeing our descriptive circulars. Write for them today.

Cascaden Mfg. Company, Waterloo, Iowa.

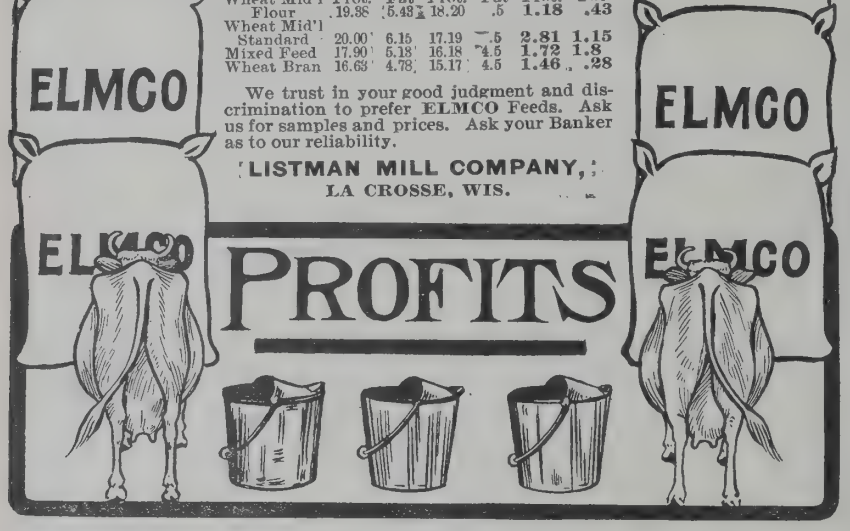
P. M. SHARPLES,
West Chester. Pa.,
U. S. A.

We are not interested in talking to feeders who can't figure beyond cost price.

ELMCO Feeds are not cheap feeds in any sense of the word. They are milled for results and only interest feeders who feed for results. The mill offering low priced feed is generally simply offering inferior feed; for it is reasonable to suppose they are asking all they feel it is worth.

First class feed cannot be made from second class wheat or by a slighted milling process. The best grades of hard Spring wheat, properly milled, make profitable feed. Damaged or immature wheat, or wheat improperly milled, contains too much fiber and moisture. It can be sold at a low price because the wheat does not cost much and the milling process is cheap.

In comparison with feeds analyzed by the Mass. Experiment Station, **ELMCO** Feeds show the following superiority:



CHEMICAL ANALYSIS

	ELMCO Feeds		Other Feeds		ELMCO Superiority	
	Prot.	Fat	Prot.	Fat	Prot.	Fat
Wheat Mid'l Flour	19.38	5.43	18.20	.5	1.18	.43
Wheat Mid'l Standard	20.00	6.15	17.19	5	2.81	1.15
Mixed Feed	17.90	5.18	16.18	4.5	1.72	1.8
Wheat Bran	16.63	4.78	15.17	4.5	1.46	.28

We trust in your good judgment and discrimination to prefer **ELMCO** Feeds. Ask us for samples and prices. Ask your Banker as to our reliability.

PURE OIL MEAL.

USE FOR MILCH COWS AND FATTENING STOCK.

Superior to corn, oats and hay. Car Lots $20.00; Ton Lots $21.50; Half-Tons $11.50; 500 pounds $6.25; 100 pounds $1.50. Put up in 100-pound sacks f. o. b. Minneapolis. Cash with order.

This Meal is Guaranteed Absolutely Pure. We also manufacture Strictly Pure Linseed Oil.

NORTHERN LINSEED OIL CO.,

MINNEAPOLIS, MINN.

When ordering mention this paper.

ARMOUR'S BLOOD MEAL

Cures Scours in Calves.

First proved by the Kansas Agricultural Experiment Station, and since corroborated by thousands of leading stockmen who have used it without a single failure. Equally effective for the diarrhea of all animals.

PREVENTS weak bones, paralysis of the hind legs and "thumps" in pigs; "big head" of foals; "rickets" of all young animals; abortion due to incomplete nutrition, and a host of other troubles.

A Potent Food for Work Horses, Dairy Cows, Poultry.

Write us for booklet giving valuable information about **Blood Meal** and our other feeding products. Consult us free of charge regarding stock diseases.

Entered at Fort Atkinson, Wisconsin, as second-class matter.

An Ohio Grade Holstein.

ED. HOARD'S DAIRYMAN:—I enclose a snap shot of a cow that has been a "bread winner" in our dairy. In Janurary 1899, she gave 59 lbs. milk in 24 hours, testing 2.45 lbs. butter fat. Her feed consisted of ensilage, clover hay and eight pounds of gluten feed. Have tested her when her milk showed 5% fat.

No regular record has been kept of her milk, but in 31 days in July and August, 1900, she gave 1610 lbs., and we feel sure she has given us over 60,000 lbs. of milk in six consecutive years. She is a grade Holstein, purchased of the late C. W. Horr, Wellington, Ohio, in 1895.

GEORGD R. CREHORE.

Lorain, Ohio.

The Pennsylvania Dairy Union.

ED. HOARD'S DAIRYMAN:—The Sixth Annual Meeting of the Pennsylvania Dairy Union was held at Loch Haven, Pa., Dec. 2nd and 3rd.

The President, Dr. H. P. Armsby, Dean of State College, called the meeting to order. The Mayor of Loch Haven, Hon. John T. Cupper welcomed the visiting members of the Dairy Union, and Dr. Armsby gave the response in behalf of the Dairy Union.

Dr. A. T. Neal, Director of Delaware College, Agricultural Experiment Station, spoke informally upon "Some of the Sources of Nitrogenous Food for Dairy Cows." It was assumed fundamentally that on a farm of 200 acres, 1,800 bushels of corn might be raised, of which one-third would be given to pay for the labor, and two-thirds would be left as the portion falling to the land. Of this 1,200 bushels of corn, the support of the horses and poultry and pork production would consume the entire amount, leaving to the herd as its portion of the corn crop, the stover alone. From 50 acres this should be sufficient to nourish 30 milking cows, when properly combined with other sources of food. Twenty pounds per head per day of this stover, would furnish one-seventh of the protein and one-half of the starchy matter necessary to maintain a full flow of milk in a cow of the normal weight of 1,000 pounds. To secure the sixth-sevenths of protein and one-half remaining of the starchy food, alfalfa was suggested. In addition to the 12 lbs. of alfalfa required for this purpose, 2 lbs. of cotton seed meal would be required to make a normal ration.

In order to secure the complete consumption of 20 lbs. of dried stover, it was found desirable to pack many tons of it into a silo, and add thereto one ton of water for each ton of stover. This caused the entire mass to heat to 165°, bringing about a rather agreeable aromatic odor and such changes in the composition of the stover necessary to attract the live stock and render it palatable. So prepared, this stover was eaten with practically no loss. Alfalfa hay is an extremely difficult crop to grow, but it is also so extremely valuable that no effort should be spared to secure it; and, whenever it can be bought more cheaply than it can be raised, no sentiment or theory should stand in the way of its purchase. Its price in Central Nebraska today of $6.75 per ton baled, F. O. B. cars, is low enough to attract the attention of buyers; but the freight rate of nearly $10 per ton charged by the transportation companies to Pennsylvania points makes it a question whether the farmers can afford to get it this way. Even at this price, however, of $17 per ton, in round numbers, it is $2 per ton cheaper than bran, and preferable to bran in the minds of practical feeders.

To those, however, in the long run, who lack confidence to attempt the cultivation of alfalfa, a substitute for it can be found in the crimson clover and the Southern cow pea. Neither of these crops taken alone is the equal of alfalfa in quantity, although strangely enough, either one is fully equal to alfalfa in quality. The clover occupies the land from September until the middle of May, and the maximum crop of it would make about 2½ tons of hay per acre. After the removal of the hay, about the middle of May, there remains ample time to plow the land and seed it to one of the early maturing upright-growing varieties of the cow pea. For this, the New Era variety is especially desirable. This crop can be secured by the last of August, and with favorable surroundings, a maximum yield of 2¼ tons of dried hay per acre may be expected. As a substitute for alfalfa, therefore, the crimson clover occupied the land in winter; the cow pea, in summer. They are also recommended, for in quality the products equal that of alfalfa, and in quantity the combined crop will slightly surpass a maximum crop of alfalfa hay per acre.

Questions were asked as to the safety of feeding clover hay to horses and cows. The reply was that there never has been danger in feeding it to cows, but that in certain cases, if the clover is allowed to become too mature, portions of it, and particularly portions of the blossoms or seed heads become practically indigestible and result in inflammation and in death. This danger is avoided by cutting the clover shortly after the blossoms are well developed and before the seed is formed.

A substitute for packing the shredded fodder in the silo was proposed by Dr. Conard, namely to utilize the steam remaining in the boiler after the separation of milk and the cleaning of cans, in scalding fodder intended for the subsequent day's feeding. Attention was brought to the fact that the concensus of opinion is strongly against cooking food for cows, as in every case it seems to interfere with digestibility. It was conceded, however, that Dr. Conard's end, namely: softening the food for its better mastication by the cows, would likewise be attained by his method.

As to the question, whether the small amount of cotton seed meal added to the ration of shredded fodder and alfalfa hay may be avoided, and the total supply of food gained from the farm itself, the reply was that whenever the market prices of food products are lower than the farmer's cost of production, he should produce rather than raise his food; but, that in this case it was highly probable that by the judicious selection of seed then the percentage of protein in both stalk and grain could be so materially increased that the cotton seed meal might possibly be reduced to one-half or entirely omitted.

A GRADE HOLSTEIN COW.
Property of GEO. R. CREHORE, Lorain, Ohio.

BUFF JERSEY'S HERD.

The method of selecting seed corn with the special end in view of raising a product richer than the average in protein, was then discussed somewhat at length. These methods are well known to the readers of this paper who have familiarized themselves with the work of the experiment stations of the central West.

Major H. E. Alvord, Chief of the Dairy Division of the Agricultural Department, Washington, D. C., gave an illustrated lecture on Dairying in This and Foreign Countries. Pictures were shown of dairying conditions in Denmark, Holland, Normandy, and other places; of cheese making in Roquefort, together with many of incidental interest.

Twenty Years Experience in the Science and Art of a Dairy Herd was the subject discussed by the Rev. J. D. Dietrich of Flourtown, Pa. Scientific knowledge, it was stated, is the foundation of agriculture today, and all that has been secured in this line by scientific men is accessible to all and should be taken advantage of. In the last twenty-five years more has been discovered in the science of growing crops than in the previous history of the world. That which has been done before is guess work. Such rapid progress has been made in husbandry that no man could keep pace with its advance and be satisfied to see his name to a published article two years afterward. In proportion as the farmer complies with the laws of the Deity is he successful with his farm and his flock, and it must be remembered that God is not going to feed the man's flock, if he himself has neglected it.

As a man would not desire to have one stalk of corn 20 feet high and the others below the average, so is it better to so improve the dairy herd that the average cow will give 20 quarts of milk, rather than that there should be an unusually large yield from a few. Mr. Dietrich's system is to keep his cows in the dairy barn, and to exercise them only by leading them out with a halter. Whenever, however, the cow is thus brought within the walls of a stable she must be watched, that her powers are not weakened. The East wind, Mr. Dietrich says, affects the cows markedly, lessening the amount of milk, no matter how well they are fed. The cold North-west wind has a bracing effect upon the animal. The South and West winds do not seem to have any effect. For this reason the ventilation of the dairy barn is a matter of importance. After fifteen years' experience in stabling dairy cows, Mr. Dietrich does not believe that the domesticity of an animal weakens its constitution. The temperature of the barn should be an even one, and in cleaning, care should be taken to avoid having a draft. The comfort of the animal is as much to be considered as its food, and the atmosphere of the barn should be kept pure.

The care of the manure is mentioned as of great importance in improving the fields. It is not left in the barn yard, but put at once upon the fields. As a result of this method his soil at a recent examination showed five millions of bacteria to the one-thirtieth of a cubic inch, just four times more than the best soil ever examined by the chemist.

In the discussion of Mr. Dietrich's paper he replied that the temperature of his dairy barn was kept at fifty-five. In support of his system of soiling, he quoted the statement of one man who after following his plan sold $1,900 worth of products as against the previous yearly output of $900 worth. By his method Mr. Dietrich averages nearly 30 tons of silage to the acre. The rye is sown broadcast and the field top-dressed, which gives a heavy yield. Thirty-five lbs. of ensilage he employs as a daily ration, and always has a mixed feed. By feeding three times a day he finds that more milk is given in the evening. The ration is mixed to suit the lactation of a cow. Table salt is used in preference to the coarse salt. It is suggested to milk three times a day, measuring how much more milk is thus given. To make a cow dry he gives timothy and water; exercises the cow with the halter, and skips teats in milking. By this method the animal will go dry in six days.

Professor George C. Watson, Professor of Agriculture at Pennsylvania State College, read a paper on The Silo and Silage Crops. He said in part: "The history of the silo in the United States, in many respects, resembles that of other new and important inventions which have tended more or less to revolutionize well established practices and customs of the agricultural people. Many farmers who have had comparatively little knowledge of silos or of feeding silage have constructed silos in an endeavor to make silage an important part of the ration of various classes of domestic animals. Failures have resulted; expensive lessons have been learned. Not only did these farmers not know how to harvest and preserve most efficiently and cheaply, but they did not understand how to feed to the best advantage, that which they had preserved.

With the advent of the silo the American farmer came to a fuller realization of the importance of providing some succulent food for dairy cattle. Those who persisted in raising mangel-wurtzels for dairy cattle first learned the true value of succulent food and the manner in which it should be fed. The feeders of roots learned a lesson that was not learned so early by those who fed corn silage, and even yet corn silage is not fully appreciated by the majority of feeders. The value of the roots as a food is due, in a broad sense, to their relation to other foods.

Agriculturists are becoming more and more like business men in looking for profitable returns on investments. With improved machinery for harvesting and handling the silage crop, the advantage has turned somewhat in favor of the silage when compared with field cured corn, on the basis of digestible nutrients alone. The standard of conditions as to food and temperature is best provided by Nature in May and June. Those who have added materially to that with which they

have been dealing, or who have made the breed of live stock better than they have found it, have had clear-cut standards. High standards continually kept in mind are essentials to systematic improvement. In very recent times marked changes have been made in the kind and quality of food provided for the dairy stock. Generations of time alone will record the results. As a basis, conservative Americans will adhere to that which has been proven to be wholesome and economical. In my judgment the safest and most successful feeder of the future will be he who will make the best use of America's most abundant and cheapest food plant, corn.

It was resolved that the Pennsylvania Dairy Union hereby expresses its great satisfaction at the unanimous passage by the legislature and the approval by the Governor of a bill appropriating $100,000 for beginning the construction at the Pennsylvania State College of an agricultural building; and that copies of the resolution be sent to the Governor and to the chairman of the Senate and House committees on appropriations.

A resolution was passed recording the Pennsylvania Dairy Union's commendation of the administration of the pure food laws of the Commonwealth by the Dairy and Food Commissioner, Hon. B. D. Warren, and pledging its support in the enforcement of the laws upon this subject.

It was also resolved that the Pennsylvania Dairy Union be officially represented at the dedication of the new Dairy building at the Pennsylvania State College.

The following officers were elected: President, Dr. H. P. Armsby, State College; 1st Vice-President, Mr. Austin Leonard, Troy; 2nd Vice-President, Rev. J. T. Dietrich, Flourtown; Treasurer, Mr. W. E. Perham, Niagara; Secretary, Dr. M. E. Conard, West Grove.

Philadelphia, Pa. L. C. ALEXANDER.

Maine State Dairy Meeting.

ED. HOARD'S DAIRYMAN:—This young state association met Dec. 1-3, at Dover, the twin town of Foxcroft, which is the county seat, and home of hale and wholehearted State Commissioner of Agriculture, A. W. Gilman.

A well arranged program greeted friends and visitors, and there was the usual strong array of eminent speakers.

The Association held out $110 in prizes for butter, and $20 for cheese, with a prorata, or consolation prize of $50 for non-winning contestants in the nine classes for which first, second and third prizes were offered.

Special prizes were offered by Vermont Farm Machine Co., Worcester Salt Co., Heller & Merz Co., *Lewiston Journal*, *Maine Farmer*, *Turf, Farm and Home*, and *Piscataquis Observer*, the local newspaper.

Usual addresses of welcome and responses were made, and the first day culminated in a grand banquet which had its full mead of eloquence and flow of soul without the bowl. No stimulating beverage is needed in the Pine Tree state along with the refreshments, for the physical man to give a proper degree of enjoyment to these social hours. The banquet was a great success, and many fine sentiments were expressed by the eloquent speakers.

The annual address of the President, Hon. Rutillus Alden, of Winthrop was brief and businesslike. He voiced the sentiments of this association and many people outside of it, when he scored the appropriation of $40,000 to represent Maine at St. Louis with a log cabin, and show of wild animals, instead of as she really is, a progressive state, with a display of her agricultural and horticultural products.

"Producing and Handling Milk for Retail Trade" was discussed by George H. Ellis, of Boston, Mass. The subject was handled as was to have been expected by one familiar with every detail. Keeping the milk clean and in its natural condition is considered far better than any kind of manipulation to kill bacteria. The speaker believes in, and practices, weeding diseased animals out of the dairy herd, taking every possible precaution to produce good milk, free from any taint, and to keep it scrupulously clean in conveying it to customers. When his cows have been culled down to those which pay to keep, he finds they cost $60 apiece.

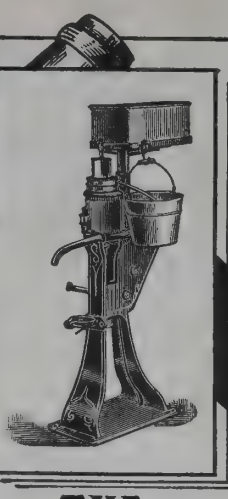
Up here in Central Maine he is sure farmers can raise heifers to 31 months for $25, which cost him $40 at that age. This Massachusetts milkman buys Nebraska alfalfa and considers it a third better than clover hay. Mr. Ellis stated that the people want 5 per cent milk, and he breeds Jerseys and their grades to produce it. He had no prejudice against Holsteins, but the people rather water their milk themselves.

An effort is being made to make the fairs, for which the state is paying out considerable money, as strongly educational as possible. To this end the score card is superceding the old methods of judging exhibits, aud the experts are thereby giving the reasons for their choice of subjects for premiums, and those who are in attendance to learn, thereby receive the benefits of the expert judge's work, and premium offers, by seeing and studying the tangible points on which the decisions are rendered.

The score card is still conceded to be unpopular with stock exhibitors, and old time comparison judges, but this is expected to wear away with increase of knowledge. Toward this end the address of Prof. G. M. Gowell on "The Score Card in Show Rings" was a strong plea for this advance in judging at fairs. It was asserted that the Short-horn breeder can not judge a Jersey cow and *vice versa*. The judge must keep the ideal cow of the breed he is judging in mind, and make his score card record of the individuals as he goes over them, in comparison with the form of this ideal cow.

The score card system is the one lawfully in force in Maine now. The judges at the recent fairs do not like it but "shall we allow this advanced system to be overthrown simply because we do not understand it?" (Applause).

Under the subject, The Holsteins the Most Profitable Breed, Mr. W. S. Keene, Boston, Mass, gave an address that is hard to answer by advocates of the supremacy of other breeds. He cited records and tests that are becoming numerous and familiar to the public, by reason of the work being done with unquestionable exactness, under the direction of Mr. S. Hoxie, Superintendent of Advanced Registry.



This speaker not only supported the records as to the Holstein-Friesian being the best and most profitable cow, but he claimed for this breed that it is without a peer for making veal, and when you are through with the cow in the dairy she will bring as much as any of the beef breeds. Mr. Keene has a stock farm near Newport, Me. and produces milk for the Gail Borden Condensed Milk Co's plant at that place. He began nine years ago and with scrub cows. These were kept in the common way for three years. Then scales were purchased and records kept, so from that time every cow has been kept on her merit. A registered Holstein-Friesian bull has been at the head of this herd and the pure-bred female calves are raised, while the grades, when a few days old, readily bring $10 each to be raised for cows. The male calves at the same age sell for $5 to $10 to make veal or oxen.

The standard at first was 2800 quarts of milk per cow per year. Now 2-year-old heifers average 4000 quarts and mature cows 5000 quarts. Thoroughbred bull calves sell readily at $30 to $40 each when a few days old and one five months old sold for $80. The only way a start was made in order to accomplish this, was to find out by the record what each cow was doing. The milk is sold by weight, so it is not regularly tested as it would be if sold as cream, or made into butter. It does, however, average about 4 per cent at the factory, which is considered all right there.

Following the above, Mr. Z. A. Gilbert, well known as a leading spirit in agricultural affairs for a quarter of a century, read a discussion on the breeding and care of dairy cows. He finds the temptation to feed to push up production has had an effect in reducing the vitality of cows in this state, to a point where many cows do not transmit vitality enough to their calves so they can be raised. He lamented the facts, and urged reform in this line of dairy husbandry.

Mr. C. L. Jones gave a practical talk on this subject. He and others seemed to agree that cows are and have been subjected to conditions in Maine which were of the nature of hardships for the Jersey cow, and she has deteriorated here in Maine as it is not so easy to find a good Jersey cow now as it was in the early days after her introduction here. One speaker asserted that the bluff, hardy, old Maine farmer is a strict disciplinarian

BUHL CANS ARE NOT Like Other Milk Cans Because They Are Better

This is equally true of the **Buhl Factory, "Improved Elgin" and Genuine Iowa Cans**; superior material, design, workmanship, and smooth finish combine to produce those **long wear** qualities for which the **Buhl Cans** are so renowned. **Remember** the Buhl is the only can in the world that is made with the BUHL "VICTOR" CAN BREAST and the BUHL "VICTOR" ROUND HANDLE. They may cost a little more than common cans—we do not know, for we cannot tell how badly "the trust" and others are beating you. We know that the small added cost of the **Buhl Cans** will prove the best can investment you ever made. Every can that is stamped with our famous Milk Can Trade Mark, as shown here is a genuine **Buhl Can.** The mark is a guarantee of all around excellence. Ask your local dealer for **Buhl Cans.** If he does not have them he can get them for you. Write us about it. We will see that you are supplied.

Buhl Stamping Company, 212 W. Larned Street, Detroit, Mich.

CREAMERYMEN DAIRYMEN and MILK DEALERS

St. Clair, Mich.

Siloing Timothy and Alfalfa.

ED. HOARD'S DAIRYMAN:—I wish to give a little of my experience and also wish for some information. For two seasons I have filled a round silo that holds abont fifty tons of silage with the second cutting of mixed grass, that is clover and timothy, cut and drawn direct from the field and put in the silo without cutting, tramping as hard as possible. The first season, made some mistakes by putting in when the grass was too dry and some was cut and exposed to the sun for two hours and then put in, although with quite a little waste on top. It was pretty good feed and our cows milked well on that feed and corn silage and bran.

By observing our mistakes of last season we adopted, for the last filling, putting in the silo only fresh cut, that is, we would cut early in the morning when wet with dew or cut no faster than we could draw, and put in the silo without wilting at all; in fact, the last was cut and put in right away after a rain and the grass was so wet that the water dripped from the load as it was drawn up to the silo.

Now for the result. We have some feed greatly relished by the cows, so much so that they have to be fed a limited quantity or they will over feed, and but little waste on top. I think all the waste could have been wheeled away on a barrow at four or five loads. The feed is greener and has not so strong a smell as last season. I am so well pleased with the result that I would like to know if any of your numerous readers have ever tried using alfalfa in that way. I saw a little this fall of the last cutting and it was fine feed.

As I have no alfalfa growing as yet, I have this plan in my mind. I have a small field of about three acres near the barn that I shall prepare for silage corn for next season and then seed with alfalfa and cut the first crop for the sllo, the second crop for hay and in the meantime, if a drouth comes, feed from the silo the first cutting and fill with the last or cut the last and cover the silos that are filled with corn. The trouble of making hay of the first and last cutting of alfalfa in this section is, about that time it is almost impossible to cure it and save the leaves on, and I thought by putting it in the silo I would save all the feeding value and as grass is considered as nearly a perfect food for cows it would be an easy and desirable way to dispose of the first and last cutting. Can I get any information on the subject through your paper and if any of your numerous readers have had any experience will they kindly let me hear from them through your columns?

A. D. BAKER.

Auburn, N. Y.

Handling a Bull.—Apple Pomace.

ED. HOARD'S DAIRYMAN:—I have been much interested in the articles lately written in the DAIRYMAN in regard to handling the bull. My little experience in the past six years would not permit me to be authority on the care or handling the bull. The grand-sires of the bull I have at this writing, were both very cross, so I am told. My neighbors tell me he will kill me, but I have no fear of him and he knows it. I believe the very first lesson a young bull should be taught is to learn who is boss, and I taught this fellow his first lesson while he was running with the herd.

Now, I do not advocate whipping the bull every time he does not get the proper move on him, but I do think when he needs correction there is nothing better for his bullship than a good dose of whalebone elixir. At any rate I find it works well with mine. I believe there are more bulls spoiled by cross men than any other way. I do not agree with some that the bull should not be petted or spoken to kindly. A well-bred bull is no fool and knows who his friends are and will appreciate a kind word and friendly pat when one goes to feed him.

I fasten my bull with a small chain around the horns, then fastening to the rings in nose by snap. The tie rope is then fastened to chain about six inches from nose. They give less strain on the nose if he should pull. I prefer the ground for the bull rather than the floor with plenty good bedding. I am going to set a good, hard wood post in ground about four feet deep, about the same above ground. In top of post will put a heavy round, iron bar; on the bar a good ring. This will give him a chance to walk around the post for his exercise, and if he wants to butt off some of his surplus energy, he can go at it.

I have never seen anything in the DAIRYMAN in regard to the feeding of apple pomace. I have been experimenting a little with it this fall. Put about 15 tons in silo and three or four loads of green corn in the bottom of silo, also put three loads of pomace on store room floor. So far, I like it very much; it will heat the same as ensilage; while heating becomes quite acid, but seems to lose some of the acidity after heating.

I feed about twenty-five lbs. per day to my cows, putting the grain on it, but they will eat the pomace first. Calves are getting along well on it; bull gets about the same as the cows. I believe, where it can be drawn within two or three miles, it will make a very good and cheap succulent food.

I drew mine about two miles; it cost me nothing but the drawing. I have a Holstein cow that gave 1,214 lbs., one month, milk. Her ration was 12 lbs. wheat bran and white middlings mixed, and 25 lbs. pomace for roughage. She had corn stover and unthreshed oats.

Perhaps this letter is like the young minister who preached his first sermon; after he had finished the old minister said not a word, so the young preacher wanting to know how his sermon suited, said, "I hope the length of my sermon did not tire you." "No, nor the depth of it either," said the old preacher. So, Mr. Editor, if the length of this does not tire you, the depth surely will not. That the DAIRYMAN is without a peer is the judgment of your esteemed reader and countryman. W. W. G.

Gloversville, N. Y.

A North Dakota Ration.

Can you formulate for me a ration for milk cows from the following feed stuffs: Bran and shorts, that is, not separated at the mill, per ton, $16; bran, from another mill, $18; shorts from another mill, $.0; middlings, $22; ground oats, $30.20; ground rye, $30; ground barley, hard to get, $25, and all the native prairie hay they will eat that was cut in season and stacked in good shape. Please state amount of feed per pound of milk or proportionally. O. B.

Dickinson, N. D.

Unless there are some objections that do not appear in the written statement, we should select the unseparated bran and shorts which can be had at $16. Give the cows what hay they will eat and from 6 to 10 pounds of this mixed feed, or at the rate of one pound for each 3 pounds of milk.

In regard to apportioning feed to product, read what we have to say concerning Revised Feeding Standards for Cows in Milk.

"ADVERTISEMENT."

ON FOOD

The Right Foundation of Health.

Proper food is the foundation of health. People can eat improper food for a time and not feel any ill results until there is a sudden colapse of the digestive organs and then all kinds of trouble follows.

The proper way out of the difficulty is to shift to the pure, scientific food, Grape-Nuts, for it rebuilds from the foundation up. A New Hampshire woman says: "Last summer I was suddenly taken with indigestion and severe stomach trouble and could not eat food without great pain; my stomach was so sore I could hardly move about. This kept up until I was so miserable life was not worth living.

"Then a friend finally, after much argument, induced me to try Grape-Nuts food and quit my regular food. Although I had but little faith I commenced to use it and great was my surprise to find that I could eat it without the usual pain and distress in my stomach. So I kept on using Grape-Nuts and soon a marked improvement was shown, for my stomach was performing its regular work in a normal way without pain or distress.

"Very soon the yellow coating disappeared from my tongue, the dull, heavy feeling in my head disappeared and my mind felt light and clear; the languid, tired feeling left, and altogether I felt as if I had been rebuilt. Strength and weight came back rapidly and I went back to my work with renewed ambition. Today I am a new woman in mind as well as body and I owe it all to this natural food Grape-Nuts." Name given by Postum Co., Battle Creek, Mich.

There's a reason.

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of them read dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own light who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

CHICAGO FAT STOCK SHOW.

The fat stock show, at Chicago, last week, is not of a class in which dairymen can have much interest, it is so entirely outside of their methods and experience. Fat stock and dairying are at opposite extremes, and a 2,000-pound steer don't fill a dairymen's eye half so well as a smaller 1,000-lb. cow of one of the dairy breeds; but none the less, it is a most excellent place for a dairyman to visit and then go home and think things regarding his own business.

It is true, he would cut but a small figure among the crowd of fat steers, sheep, hogs, big horses, and many thousand visitors, and it might be necessary to get himself off in a corner and cogitate all by his lonesome, unless he had been fortunate enough to pick up another wandering dairyman, who had also been rash enough to invade the enemies' country.

Everything on four legs is fat and round and smooth at this show. You see no examples of enormous udders with a cow as a side issue, no sharp back bones, incurving thighs nor pelvic arches; all these are carefully hidden under many folds of red meat and white fat and in proportion as the enveloping flesh and fat are placed according to rule, so are prizes given.

A chattering, disputing, gossiping throng surrounds the animals; enough noise and light to stop the milk flow of a true dairy animal. But amid the blaring band, cheering students, etc., the animals stand and chew their cud in sleepy content. Any nerves, if they have them, are hidden under so many layers of fat that all disturbing noises are deadened before reaching them.

It may be asked, what is all this to the dairyman? Well that depends on the man. For one thing, let him take to heart the fact that for the last two years, the despised "book feeder" or "book farmer" has produced the prize steer. It was not chance that did it, but design. With malice aforethought, the Professor of the Nebraska Station hunted out the animal when he was a calf, and his judgment and feeding have produced an animal that has taken $450.00 in premiums, and then sold at auction for nearly $500.00. If this is the result of "book feeding" let us have more of it.

Agricultural students were very much in evidence, both to sight and hearing; each prize animal having its own knot of admirers discussing its points, and endeavoring to settle why the judge did thus and so.

Of course it is impossible for more ways than one, to hold a corresponding exhibition of dairy cattle. A cow can not be handled like a fat steer, and the combination of crowds, light and noise would be disastrous to the future use of a champion butter producer; but none the less dairymen should attend the Chicago show, if for no other reason than to observe the methods employed, the results obtained and the enthusiasm that the cattle men put into their business.

REVISED FEEDING STANDARDS FOR COWS IN MILK.

Close readers of HOARD'S DAIRYMAN cannot fail to have noticed that we long ago repudiated the so-called German (Wolff) feeding standard for milch cows, with its inflexible requirement of 2.5 lbs. of digestible protein and a nutritive ratio of 1 part digestible protein to 5.4 parts carbohydrates, and that we are but little better pleased with the Wolff-Lehmann standards, although the latter recognize to a degree the fact that the amount of milk yielded should be considered.

We were not so situated as to make carefully conducted experiments practicable, but observations in our own herds indicated that there was a rich field here for Experiment Station work. For example, if a cow weighing 1,000 lbs., requires .7 of a pound of digestible protein for daily maintenance and yields 30 lbs. of 4 per cent milk, containing approximately one pound of protein in the form of casein and albumen, we asked them to tell us what became of the remaining .8 of a pound of digestible protein, or failing in that, tell how much protein was actually needed to enable such a cow to produce that or any other amount of milk.

Prof. Woll, of the Wisconsin Station, made an attempt to solve this problem by getting the average ration fed by successful dairymen in Wisconsin and elsewhere. As might have expected, there was very little uniformity in the reports received, but after a careful study of the figures he proposed an American standard of 2.2 lbs. digestible protein, 13.3 lbs. carbohydrates and .7 of a pound of fat.

This was a long step in the right direction, but it could hardly be called a scientific conclusion, because it had no definite, well-ascertained figures upon which to rest, and we continued to clamor for more light. We confess that the answer to our demand has been very slow in coming and that the great majority of Experiment Stations—in fact all but three or four—have preferred apparently to accept the German standards and plod along in old ruts, rather than undertake original research work in this direction.

Indeed, only one Station has set itself strenuously at the problem of undertaking through a succession of years to ascertain the exact relation of food consumed to milk produced. We refer, of course, to the Minnesota Station, where the powers in control have permitted Prof. Haecker to study and experiment on milk problems. This work has been going on for nearly or quite nine years now, and, although a mass of valuable data has been accumulated, the end has not been reached. Like every careful experimenter, Prof. Haecker makes haste slowly, and does not jump at conclusions.

He has published three bulletins reporting progress, the last one in the early summer of the present year, and from it we compile the following table of feeding standards:

FOR COWS WEIGHING ONE THOUSAND POUNDS.

YIELDING MILK.		DIGESTIBLE NUTRIENTS REQUIRED.		
Amount	*Testing*	*Protein*	*Carbohydrates*	*Fat*
Lbs.	%	Lbs.	Lbs.	Lbs.
10	3	1.10	8.81	0.24
	4	1.17	9.14	.26
	5	1.24	9.47	.28
20	3	1.50	10.62	.38
	4	1.63	11.28	.42
	5	1.78	11.94	.47
30	3	1.90	12.43	.51
	4	2.10	13 42	.58
	5	2.31	14.41	.65
40	3	2.29	14.24	.65
	4	2.57	15.56	.74
	5	2.85	16.88	.83

For variations in live weight above or below 1,000 pounds, add or substract for each 100 lbs. .07 pounds protein, .7 pounds carbohydrates and .01 pounds fat.

It should not be forgotten in this connection that the foregoing figures are deduced from experiments with cows that were housed in warm and well ventilated stables, had the best of care, and were milked, fed and watered with clock-like regularity.

And it may be said that Bulletin 102 from the Wisconsin Experiment Station, entitled, "Studies in Milk Production," substantially corroborates the foregoing figures in the item of amount of digestible protein required, although the Wisconsin cows consumed considerably more carbohydrates and fat, which may be explained, in part at least, by the circumstances that many of them were growing heifers.

A CHANCE TO STUDY.

I have brought along a few hundred copies of last week's issue of HOARD'S DAIRYMAN for distribution here to-day. This issue contains a "Cow Census" or investigation of fifty patrons of Creameries about Plymouth, Indiana. This census was taken to throw a strong light on the inside facts on the difference in the actual outcome for a year among dairy farmers. At the request of the Indiana Dairymen's Association, Mr. C. P. Goodrich of Wisconsin went to Plymouth and spent a week in digging up these bottom facts. These constitute a part of the 830 farmers and their herds that I told you had been investigated and the results published in HOARD'S DAIRYMAN. They will be used especially at the Indiana Dairy Convention this week. I wish every farmer here to take a copy home with him and read this report. He will then see how a low plane of thinking and management of a dairy farm comes out. Follow Mr. Goodrich faithfully as he reasons out the actual conditions of things.

You will please note especially how his investigations and statements on page 970 bear out and confirm what I have said to you in regard to the great cash value of making a special effort to read more, study more, and think more on this business of dairying. Please consider also that I am not talking this because I am an editor of a dairy paper.

My labor, my money, my thought are deeply invested in this question. Eight hundred farmers bring milk every morning to the 10 Hoard Creameries.

I have followed these men up in the mistakes as well as the successes of their yearly work. I can easily know what their cows earn. I have seen them for years handicapping themselves with wrong ideas of how to conduct this business, the kind of cows they should employ, and the kind of management they should give their farms and herds. I have seen one patron make 600 per cent more net profit than another only a mile away. I have seen why he did this. That it was because the successful man would read and study and the other would not. Can you wonder then that I preach the gospel of intelligence as earnestly as I do.

(Remarks by the Senior Editor, at N. Y. Dairymen's Convention.)

PUT THIS AND THAT TOGETHER.

There is a strong indisposition on the part of the average farmer, and that means the majority, to believe that he needs any special study or information on this matter of feeding and caring for the farm animals, especially the cows. Ask nine out of ten farmers if they believe that they do not understand all about the best methods of feeding, how to get the most out of their feed, as well as how to feed so as to best promote the health of their stock, and they will tell you frankly that they do not believe any such thing.

Yet strangely enough, those whose business it is to observe and study the farmer and his animals most closely, do not agree with them. Take it on the one thing of promoting health and vigor in the animals. A while ago that experienced veterinarian, Dr. Smead, told us on page 843, that "60 per cent of diseases of farm animals are caused directly and indirectly by *lack of wisdom* in feeding."

He states that the two things in the mind of the farmer that cause this state of things are either "fad notions of feeding" or "ignorance." One of course, is about as bad on the animal as the other. The difficulty lies way back, in the unwillingness of this kind of a farmer to believe that any man or set of men know any more about feeding than he does. He rejects the idea of a science of feeding, or that men who give a life time to its study are in the situation to teach him. This is not good sense.

It would prove a great eye opener if we could have a series of cow censuses taken, say twenty-five of them, covering 10,000 cows, and each devoted to some single point. Take for instance, the point made by Dr. Smead, that of conducing to the health of the cows by right methods of feeding and stabling. In our own experience, we have been powerfully impressed with this view of the case. We try to provide a comfortable method of tying the cows, one that shall keep them clean, and to that extent keep them healthy. The old fashioned stanchion does not do this. Then we keep the stable clean and sprinkle land plaster in the gutters twice a day, to absorb all the gasses and disease breeding odors possible. We are paid for the cost of the land plaster twice over in the added value of the manure from the absorption of ammonia.

Then we provide as perfect a system of ventilation as possible, one that shall prevent undue drafts of cold air, and yet when the stable is closed change the entire air content once an hour. Then we try to feed these cows in the light of the best modern sense and intelligence. What effect have all these things on health and efficiency? We can only say this: That as to health we have had but one case of sickness in the entire herd in five years and that a slight attack from indigestion. We have not had a single case of stopped teats or garget with the loss of a quarter. Practically we have sustained no expense for veterinary services except in abortion and the anual testing for tuberculosis which the herd undergoes.

In the last two years we have not found a case of tuberculosis and we never

had a case except in some animals we purchased.

As for the efficiency of the cows, we can say this: The herd averaged 30 cows for the year ending March 1st, 1903. The cream is separated on the farm and the local creamery paid us within a fraction of $70 per cow for the same. The skim milk we calculate was worth to us over $20 per cow.

Now in the light of all these facts, putting this and that together, does it pay to heed the teachings of good science and good sense?

Change of Volume of Milk by Cooling —Loss in Separating.

ED. HOARD'S DAIRYMAN:—How much will one hundred gallons of milk shrink in being cooled from animal heat temperature, 98½ to a correct cooling temperature, 38 degrees? In separating one hundred gallons of milk, what shrinkage will arise in the resulting product, that is, skim milk and cream?

KEYES FARM & DAIRY CO.

St. Louis, Mo.

Cooling 100 gallons of milk from 98½ to 38 would diminish the volume very nearly a gallon, with milk containing 4.0 per cent fat.

This loss would increase slightly with richer milk but not enough to make a practical difference.

No definite figures can be given on the loss in separating 100 gallons of milk, as it depends so largely on the conditions, separator used, etc. It is evident that aside from carelessness, 10,000 lbs. would have no greater loss than 1,000 lbs. if loss in bowl and waste are considered. The amount lost by evaporation of the warm milk as it comes from the separator, will depend on local conditions and cannot be estimated. Only a practical trial under your own conditions can determine the actual loss.

Granite State Dairy Meeting.

ED. HOARD'S DAIRYMAN:—The nineteenth annual meeting of the Granite State Dairymen's Aosociation was held in connection with the winter meeting of the State Board of Agriculture at Keene, N. H., on Dec. 1st, 2nd and 3rd.

The three sessions on Dec. 1st. were under the auspices of the State Board of Agriculture. At the morning session, the Mayor of the city welcomed the members of the board and visiting agriculturists, and Mr. Jos. B. Walker, President of the Board, responded.

Mr. Robert E. Faulkner, of Keene, followed these addresses with a talk about the "Wood Industries of Keene as affected by Forestry." Keene has acquired quite a reputation for the wood working industries within her borders and Mr. Faulkner spoke in a general manner of the relationship of the supply to the demand for wood for manufacturing purposes. He exhibited photographs and referred to the care and thought necessary to keep the wood lots in the best bearing and profitable condition.

The session of the afternoon was devoted to a discussion of the State College of Agriculture and of the Adulteration of Foods. Pres. Wm. D. Gibbs, recently chosen as the head of the New Hampshire College, reviewed the condition of the college, the work being done there, and its relationship to the interests of the citizens of the state. He impressed upon his hearers the value of education to all classes of people and that the opportunities at the state college at Durham were ever open to their will and call.

Mr. H. E. Barnard, State Chemist at Concord, gave an interesting talk on the adulteration of foods and spoke of the work of his department. The pure food laws of the state and nation were referred to and their value and relationship to the citizens of the state given. This is a comparatively new department of the state, having been established but little over two years. At first the work was mainly with water analyses; soon the inspection of milk was taken up. Now with better laws in the state the work of examining the food products sold in the state is vigorously carried on.

Three strong addresses were given in the evening to an appreciative audience. Dr. A. C. True, Director of the Office of Experiment Stations connected with the Department of Agriculture at Washington, opened the meeting with a paper on "Agriculture in the Public Schools." He felt that the public was in danger of forgetting the importance of the elementary schools to the prosperity of the country and of the greatest importance to the farm or country children. Larger communities have provided trade and technical courses and schools to develop the boys and girls in the line of business and manufacture peculiar to the sections in which they are located. The rural communities have not provided like facilities to teach the principles of husbandry or the study of Nature. He spoke of the work that had been done in this direction in some sections of the country and of the plans and aid which was accessible through the Department of Agriculture by any community. The introduction of this work into rural schools was of utmost importance to those who were unable to follow same in larger fields of learning, while to such as entered any of the many excellent technical schools and colleges, the early training thus received greatly benefitted them in their advanced studies.

Prof. E. H. Forbush, Ornithologist of the Massachusetts State Board of Agriculture, followed with stereopticon illustrations of "Birds of the Farm." He alluded to the habits of common birds and to their great usefulness.

Gov. N. J. Batchelder was introduced at the close of Prof. Forbush's talk on birds and gave with his accustomed energy and practical manner a talk on the "Rural Development of New Hampshire." He urged a stronger agricultural sentiment and belief among the rural people, the better appreciation of the advantages which the state offers for successful farming, and the true relation of the farming interests to the general prosperity of trade and manufacture.

THE DAIRY MEETINGS.

With the opening of the forenoon meeting of the second day the work of the Dairymen's Association properly began.

President James L. Gerrish, of Contoocook, gave his annual address, in which he reviewed the conditions under which the dairymen had labored during the year. He spoke of the demands for dairy products which the Boston markets called for, and referred to the growing up of the pasture to bushes and pines. With such conditions confronting the dairymen of the state, he urged all to consider the question of greater production. He advocated the use of farm separators, and the rigid enforcement of dairy laws. His address was an able and instructive one. Mr. Gerrish has served the association long and well, both as secretary and president, and his closing address was most fitting as he retired from the presidency, after twenty years of hard work for the dairy interests of the state.

The merits of Red Polled cattle were discussed by ex-President George H. Wadleigh, of Tilton. After referring to their foundation and early development, he said their special advantages lay in their being the best of feeders, quiet and docile, indoors and out, bulls weighing 2,000 pounds and over, cows 1,200 to 1,700 lbs., combining in the greatest degree the production of milk and beef; yielding 8,000 to 12,000 lbs. milk in a year. As an instance of the dual-purpose advantages of the breed, he cited a bull that weighed 3,024 lbs., whose daughter gave 43,118 lbs. milk in four years that would average 4.35 per cent, and a cow that gives 7,000 pounds milk that makes 300 pounds butter in a year, whose calf at 9 months weighed 700 pounds.

Prof. F. W. Taylor, of Durham, gave an address on "Silos and Silage," reviewing the history from early times, telling of the principles that influence the building and filling of the silo, and as to feeding of same.

The final address of the morning session was given by Mrs. Nathan B. Cox, of Ashland, on "Cheese Making on the Farm." She believed that the housewife could make 30 to 50 per cent more by making cheese than butter, and described the manner in which she carried out the work.

At the afternoon session, Mr. Arthur B. Hough, of Lebanon spoke on "The Formation of a Profitable Dairy Herd."

The key note of success in this respect he believes lies in better production which can best be secured through better cows; know your cows and their work; weed out unprofitable ones, and feed and handle them with intelligence. In a word, he said, good breeding, good feeding, good care and management, and the little dairy cow will do her part towards lifting the mortgage.

Miss Annie F. Burbank of Webster, Mass., gave an excellent address on "A New Profession for Women." She said home making had not always been ranked as a new profession. It has now become necessary for the housewife to be something more than a mere cook and toiler. The speaker believed in young women being able to earn a living outside of home, but she should as well regard the ideal home maker of today as one thoroughly conversant with the physiological effects and chemical composition of food. She must know and manage the sanitation, water supply and disposal of waste of the home. Homemaking is a science, an art and a profession. The home must be attractive, the home-maker companionable and hospitable and the children must be kept in touch with. Surely a field calling for broad intellectual training and culture.

Prof. Ivan C. Weld, Instructor in dairying and Secretary of the Association, gave an excellent talk on the comparison of dairy methods in this country and in Europe. His recent trip abroad gave him excellent material from which to speak. It is as a skillful and intelligent breeder and thrifty care-taker, that the European farmer overshadows us. We have nothing to learn from him in handling and marketing our product. Our problem lies in production.

At the business session of the Association, the following officers were elected for 1904:

President, Wm. H. Caldwell, Peterboro; Vice. Presidents, A. J. Richardson, Littleton, Freeman Gilson, Pembrooke; Secretary, Ivan C. Weld, Durham; Treasurer, E. E. Bishop, Bethelhem; Supt. of Exhibits, W. D. Baker, Rumney; Auditors, Jas. L. Gerrish, Contoocook, Geo. H. Wadleigh Tilton.

Trustees, Rockingham Co., B. E. Sanborn, Leavits Hills; Strafford Co., Geo. H. Yeaton, Dover; Belknap Co., Geo. H. Wadleigh Tilton; Carroll Co., D. R. Slade, Centre Harbor; Merrimack Co., G. M. Putnam, Hopkinton; Hillsboro Co., H. O. Hadley, Temple; Cheshire Co., J. J. Donelly. Keene; Sullivan Co., Chas. F. Rossiter, Clarement; Grafton Co., Arthur B. Hough, Lebanon; Coos Co., T. M. Casey, Stratford.

The occasion of relaxation and enjoyment, was the banquet at the Cheshire House on Wednesday evening. Two hundred persons sat down to an excellent dinner, after which, under the careful guidance of Ex. Mayor Colony, afterdinner speaking was indulged in. Mayor Tafte told of the beauties and influence, past and present of the city of Keene; Gov. Batcheller, in a fitting manner, of the state of New Hampshire; President Gibbs, of the New Hampshire College and its influence; Overseer Hadley, of the State Grange; President Gerrish, of the Dairymen's Association; while Prof. Decker of Ohio, gave kindly words of greeting and advice; Trueman Gilson recited the poem, "Honest John Thompkins" and Col. Rossman of the Governor's Staff, spoke of Good Cheer.

At the session on the following morning Trueman Gilson of Pembrooke, read a paper on dairying, telling what he had accomplished by intensive farming on twelve acres. He urged cleanliness and attention to details, as the elements of success.

Prof. E. L. Shaw of Durham spoke of the feed and care of the cow, giving general directions as to rations, watering, housing and caring for the cows.

Mr. W. D. Hayden of Dover told of his development of a retail milk business and of the necessities for successful competition, as well as trials undergone.

Prof. Decker of Ohio gave a grand talk on the "Requirements of Modern Dairying." In an off-hand manner, plain and practical, and intensified by ample illustrations, he told of the composition of milk, the principles of its secretion, the danger and manner of contamination, how to detect as well as to know the effects of preservatives. The address was highly appreciated and every one was sorry it could not have been given earlier in the session. Thus closed a most successful meeting of the association.

The display of dairy products and dairy machinery was held in the Y. M. C. A. building. The results of the judging was as follows.

The judges stated that the exhibit here, although not large in quantity, was one of the finest in quality they had ever seen. The winning scores are very high and so was the average.

The judges awarded a gratuity to the

(Continued on page 1022)

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain sepecific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

Brown Middlings and White Middlings.

I would like to have your personal opinion through the DAIRYMAN as to the difference in feeding value between flour middlings and standard brown middlings. Some say the brown middlings are ground bran, mill sweepings, dirt and weed seed. I have always thought that brown middlings were made from spring wheat and flour middlings from winter wheat, and that the brown middlings were the best for growing stock.

Which of the following feeds do you consider the most economical for feeding growing calves and pigs in connection with sweet separator skim milk fed warm? Bran, $19 per ton; brown middlings, $21; flour middlings, $25; bran and corn meal, $20. Why would not bran and gluten feed make a good ration for calves and pigs? Gluten costs $25 per ton. We feed oil meal jelly to calves up to three months. Any light you may give me on this subject will be gratefully received. C. M. K.

Shushan, N. Y.

All middlings are more or less brown, but there is not, to our knowledge, any considerable difference in the middlings whether from spring wheat or winter wheat. What we now call middlings, was in our younger days known as "canaille." If decidedly brown, we should expect more or less bran had been mixed with the middlings.

Bran will do very well for calves, but is not a good feed for pigs. Middlings make the best addition to skim milk for young pigs, and when 4 to 6 months old ground corn may be used. For greatest profit, feed one pound of middlings or ground corn to 3 lbs. of skim milk, and plenty of clean, fresh water to satisfy thirst.

Massachusetts Queries.

I have only known of your paper but a month but during that time have become much interested in it as I have found much useful information, but would like to ask you one or two questions I have not yet seen in your paper. I keep about 200 milch cows of all sorts and kinds, mostly grades. This fall I have been troubled by the afterbirth not coming away, and have, as I have been taught, taken them away myself. I should like to ask you for advice as to taking them away.

As to feed: Our cows average anywhere from 700 to 1,000, and over, pounds, most of them fresh, giving anywhere from 15 to 30 pounds and some more. Cotton seed, $27; linseed meal or flaxseed meal $24; corn meal $23; also good timothy hay. I can also buy Ajax flakes for $26. Would you advise me to substitute in place of the linseed or flax meal, and can you tell me what it is made of?

A cordial welcome is extended to you all to visit me if ever in this part of the country.

Unionville, Mass. J. G. R.

Thanks for the courteous invitation which it will be a pleasure to accept and profit by whenever circumstances make it possible.

For answer to the first inquiry see page 1003, where Dr. Hartwig has described the method to be followed as well as it can be put in words.

Ajax Flakes, we understand, is a new name for what was formerly known as Atlas Gluten Meal, and that was simply a more euphonious title for the kiln-dried by-product of a distillery, in other words, distillers dried grains. There may have been some trifling changes in the methods of manipulating the product and possibly some additions to it, but we are told they are substantially the same thing.

For the larger cows and those yielding 25 to 30 lbs. of milk, we should expect a daily allowance, substantially as follows, would be sufficient:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. timothy hay	17.36	.56	8.68	.28
4 lbs. "flakes"	3.68	.97	1.55	.46
3 lbs. ground corn	2.67	.24	2.00	.13
4 lbs. linseed oil meal	.91	.29	.33	.07
Totals	24.62	2.06	12.56	.94

Smaller cows and especially the smaller milkers, should have less grain.

A Rhode Island Ration.

Will you please give me a good ration for dairy cows. Wheat bran, $1.25 per cwt; linseed oil meal $1.60 per cwt; cream gluten, $1.70 per cwt; corn meal, $1.30 per cwt. Cows are grade Jerseys weighing from eight to nine hundred, in different periods of lactation and for fodder, I have oat hay and intervale hay. W. E. S.

North Scituate, R. I.

"Intervale hay" is a variety not mentioned in the tables of analyses, and we are therefore unable to set forth a tabulated formula, but it is practically safe to say that all these cows should have approximately 20 lbs. of roughage and the cows that have not materially slackened in their flow of milk, about 4 pounds of bran and 2 pounds of oil meal daily.

An Ohio Ration.

Please give me a balanced ration from the following feeds: Bran, $17.50 per ton; oil meal, $23; corn and cob meal, corn worth 40 cents; corn stover and clover hay. A. J. F.
Lebanon, O.

As we have said in reply to another Ohio inquiry, please read the article in this issue on the editorial page entitled, Revised Feeding Standards for Cows in Milk, and then note how incomplete this inquiry is.

The very best we can do is to suggest what might be termed an average ration, trusting to the good judgment of the inquirer to make such modifications as his conditions demand. If he attempts to drive over this road with closed eyes, or with the major part of attention given to other matters, he may reach his destination in safety or he may not.

Subject to the modifications which these revised feeding standards may call for a good average ration might be compounded as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
15 lbs. clover hay	12.70	1.02	5 36	.26
10 lbs. corn stover	5 95	.17	3.24	.07
4 lbs. corn and cob meal	3.56	.26	2.52	.14
2 lbs. bran	1 76	.25	.77	.06
Totals	23.91	1.70	11.89	.53

An Oregon Ration

Please tell me how much and what proportion to feed of rolled oats, rolled barley and fresh ground linseed meal with oat hay, and how much hay. H. R.
The Dalles, Oregon.

Ordinarily, where hay of any kind is the only roughage, cows will eat about 20 lbs. daily. and this will form the basis of the ration, the character of the hay indicating what kind of grain to select. The 20 lbs. of oat hay, if of average quality, will contain about .86 of a pound of digestible protein, and the grain should supply an additional pound, or more. This will require about 3 pounds each of the oats and barley, and 2 lbs. of the oil meal. Such a ration will tabulate as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. oat hay	18.22	.86	9.28	.30
3 lbs. barley	2.67	.26	1 97	.05
3 lbs. oats	2 67	.28	1.42	.13
2 lbs. oil meal	1.82	.59	.65	.14
Total	25.38	1.99	13 32	.62

As will be seen by reference to our revised feeding standards, such a ration as this should suffice, if cows are given proper care, for cows weighing 1,000 lbs. and yielding 30 lbs. of 4 per cent milk.

An Ohio Ration.

Please formulate a balanced ration for my cows, weighing from 800 to 1,200 lbs., grade Guernseys and Jerseys. Wheat bran, $19; wheat middlings, $23; old process oil meal, $26; corn meal, $26, with all the wet brewers grain we can feed. For roughage we have timothy and clover hay mixed, and shredded corn fodder. F. S.
Hubbard, O.

Please read the article in this issue on editorial page entitled Revised Feeding Standards for Cows in Milk, and note how impracticable it is, in view of what is said there, to submit a ration formula, that can be applied indiscriminately to all cows in a herd of the character described in the above inquiry.

For cows weighing 1,000 lbs. and giving 25 lbs. of 4 per cent milk daily, we recommend a trial of the following:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
15 lbs. mixed hay	12.79	.72	5 94	.24
8 lbs. corn stover	4.76	.14	2 59	.06
25 lbs. wet grains	6 08	.98	2.32	.35
3 lbs. ground corn	2.67	.24	2 00	.13
Total	26.30	2.08	12.85	.78

One must not be too "finicky" about small fractions of a pound one way or the other. Feed stuffs vary more or less in composition, some being slightly better and some poorer than the average. So, too, cows vary more or less, and conditions are not always uniform. Formulas and feeding standards are simply guide boards which indicate the direction the feeder should travel, but they do not show the condition of the road, the character of the team or the adaptability of the vehicle to the work in hand. Shall we then condemn guide boards and dispense with them because an inattentive driver does not avoid obstructions, or is not in constant touch with his team? Certainly not. So with feeding formulas, the herdsman must know his cows and have regard from day to day to the ever varying conditions which encompass them.

Abnormal Shrinkage in a Georgia Herd of Jerseys.

From the many agricultural papers we subscribe to, have selected HOARD'S DAIRYMAN to help straighten us out of our present difficulties. We are feeding ensilage, pea vine hay, corn fodder and about 2 lbs. cottonseed meal, but cannot get satisfactory results. Cows, grade Jerseys. Will start out with about 20 lbs. milk daily, but will gradually and quickly drop to 8 or 10 lbs. daily and within 4 to 6 months dry up. In this connection will ask you to kindly formulate a ration for us from the following: Corn ensilage (fairly well eared) limited quantity; pea vine hay $15; oat straw, $7; fodder, $8; cottonseed meal, $22; bran, (inferior) $24; dried brewers grains, $15; oats, $31; corn meal, $29.

Does it not require very close attention on part of attendant to ensure cows freshening in fall? We have been allowing bull to run with herd and found it a difficult and costly matter to change our methods. Had a high grade Jersey with lump formed in chest or brisket, concluded it was a tumor, but now find it is gradually diminishing in size or scattering. Have you any idea what is was? SUBSCRIBER.
Augusta, Ga.

Although these cows when fresh were fed less than we would advise, we incline to the opinion that inefficient milking was not without considerable influence in causing the abnormal shrinkage reported. Cows should not only be milked rapidly—6 to 8 minutes per cow is ample time—but it is more important that practically no milk should be left in the udder. If one is handicapped with careless milkers, it is sometimes a good plan for the most careful one of the lot to go to each cow a second time and strip her out completely. While we are not able to explain fully the physiological or nervous action resulting from leaving more or less of the last milk in the udder, it is universal experience that there is no surer way to dry a cow off.

When shrinkage from any cause has become well established, it is impossible to restore what would otherwise be a normal yield. The most that can be done is to arrest further abnormal shrinkage by proper feed, proper care and proper milking and await another freshening. And even then extra attention is required to prevent the cow from lapsing into old habits, especially if these habits date back to the first period of lactation.

For cows recently freshened we recommend a trial of the following as the average daily allowance to each one:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
30 lbs. corn silage	6.27	.27	3.39	.21
10 lbs. corn stover	5.95	.17	3.24	.07
6 lbs. cow pea hay	5.36	.65	2.32	.07
4 lbs. dried grains	3.67	.63	1.45	.20
1 lb. cotton seed meal	.92	.37	.17	.08
Totals	22.17	2.09	10.57	.63

The forage called fodder by our correspondent we construe to be the blades and possibly the tops of the corn plant, and estimate it to be similar in feeding value to ordinary corn stover. Let the cows have a good teaspoonful of salt night and morning with their feed and all the fresh, pure water they will drink, see that they are properly milked and kindly treated at all times, and the chances will be that they will respond satisfactorily at the pail.

We do not approve of allowing the bull to run with the herd, and incline to the opinion that this practice is one of the causes of the trouble reported.

A Wisconsin Ration.

Please give me a ration for cows fresh in milk, weighing 800 to 900 lbs., grade Guernseys and Jerseys, from bran, $18; middlings, $18; ground corn, $23; oil meal, $30. Have for roughage, clover hay, corn stover shredded, and corn fodder.

Does oil meal lose feeding value with age, or how does oil meal, three years old at $25, compare with above price? E. O. T.
Iola, Wis.

We suggest a trial of 10 lbs. clover hay and what stover and corn fodder each cow will eat. For grain let them have daily, say, 3 lbs. each of bran and middlings and one pound of oil meal.

It is very doubtful, in our opinion, if that three-year-old oil meal is as sweet and clean and fresh as cow feed ought to be. Oil meal, with its large per cent of fat, is apt to grow rancid with age.

Some Inquiries from an Ohio Subscriber.

How would you advise feeding heifers that are to freshen for the first time this coming winter?

How would you feed matured cows that are just dry, but will freshen in about six weeks, that are heavy milkers, to avoid milk fever?

Please formulate me a balanced ration for registered Jersey cows that average 900 pounds each from the following feeds: Wheat bran, $18; gluten meal, $23; corn meal, $23; and linseed oil meal $25 per ton; oats 39 cents for 32 pounds; for roughage, have plenty of well matured corn ensilage, corn stover shredded, oat straw and at present, timothy hay. By the first of next month will have clover hay instead of timothy.
Painesville, Ohio. F. R. P.

1. See answer to J. M. O., of Pennsylvania in this issue.

2. Mostly on dry forage, with possibly a little bran. See to it especially that the bowels are in good order, and to this end you may use a little linseed oil meal or may give laxative doses of Epsom salts. At time of freshening, be sure to avoid all drafts of air, give only warm water to drink and a handful or more of bran in the water; do not milk out clean. If practicable, leave cow with calf for three days.

3. After these cows freshen, bring up gradually to a daily allowance substantially as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
35 lbs. silage	9.24	.46	4 90	.25
8 lbs. clover hay	6.78	.52	2.86	.14
4 lbs. bran	3.52	.50	1.54	.12
2 lbs. gluten meal	1.76	.64	.82	.05
Totals	21.30	2.12	10.12	.56

Possibly some of these cows, if not all of them, will eata little more silage or hay or both, than above specified. If so, let them have, but bear in mind it is better they should be a few mouthfuls short rather than a little more than they will care to eat. They should be so fed that they will come to each meal with a keen appetite.

"ADVERTISEMENT."

TWICE WON.

Wife Fell in Love with Husband "All Over Again."

The wife of a well known attorney at law of Seward, Neb., tells the tale worth reading: "My husband was a soldier in the Civil War and was, as he called himself, 'an old coffee cooler', and had always drank very strong coffee.

"About a year ago he complained of a feeling of faintness every time after climbing his office stairs and was also troubled by terrible headaches that almost drove him wild.

"He gradually grew weaker and weaker until his affliction culminated in nervous collapse and for weeks he seemed to be fading away from us in spite of all our efforts.

"The physician pronounced him strong and well with no organic trouble whatever and there seemed to be nothing the matter except the complete giving out of his nervous system.

"The doctors decided that coffee was at the bottom of all his trouble and ordered Postum Cereal in its place. He improved daily since he quit coffee and began drinking Postum and now says he feels better than he has felt for 20 years, headaches are gone, no more fainting spells and is gaining in flesh every day and he seems so much younger and heartier and happier than he has for years that I have fallen in love with him over again.

"Now for my brother's case; a few years ago he had a peculiar trouble. His tongue was swollen and sore at the roots and covered underneath with festers.

"He thought his affliction was of a cancerous nature and his doctor was of the same opinion. He could scarcely eat anything and became so poor and run down he was simply a nervous wreck. He consulted various physicians but none were able to diagnose his case or help him in the least.

"At last a doctor to whom he applied said he believed my brother was coffee poisoned and advised him to quit coffee and drink Postum. He gave him no medicine but told him to give Postum fair trial and return to him in six weeks. My brother had used Postum only about ten days when the festers disappeared from his tongue and at the end of two weeks the soreness and swelling were gone and he began to pick up in flesh and spirits.

"He has never touched coffee since but drinks Postum all the time and has never had the slightest return of the trouble.

"To look at my experience is it any wonder I can write a heartfelt testimonial for Postum." Name given by Postum Co., Battle Creek, Mich.

Caponizing Instruments--Feeding Formula.

Where can I procure necessary instruments for caponizing fowls, and also give me formula for feeding my Holstein and Jersey cows on the following feeds: Wheat bran, $21 per ton; cotton seed meal, $25; corn meal, 55 cents per bushel, and I have dry fodder, hay and ensilage,
Herndon, Va. B. H. B.

Instruments for caponizing can be had at any of the instrument houses. Write to Chas. Truax, Greene & Co., 75 Wabash Ave., Chicago, Ill., or William H. Wigmore, 107 S. Eighth St., Philadelphia, Pa.

It is simply impossible to give any specific suggestions for feeding a herd of cows varying in weights and in all stages of lactation. The best that can be done in cases of this kind is to say, in a general way, feed all the coarse fodder each cow will eat and let as much of it as practicable be silage. In addition give each cow as much grain as she can use with profit, that is, as much as she can eat without undue increase in live weight. At least half in bulk of the grain should be bran, and the amount of cotton seed meal should not, as a rule, exceed two pounds.

Feeding a Guernsey Heifer.

Would you kindly give formula for ration for a registered Guernsey heifer, first calf, with mixed hay (timothy and clover), corn stover, gluten feed, wheat bran, cake meal, corn meal? As I am a beginner in Guernseys, I wish to feed for best result, also for the best for the heifer,
Buckingham, Pa. J. M. O.

This is a very welcome inquiry as it raises an important question that has been somewhat overlooked of late. If the heifer has not yet dropped her calf, feed her liberally, but avoid as much as possible the fat forming foods. Wheat bran, gluten feed and, if necessary to keep the bowels free, a little oil meal would be strictly in order, but not in such amounts as to cause the heifer to become over fat. There is no fear of milk fever, and but little of caked udder.

If the heifer is already in milk, pursue much the same regimen, only being still more careful not to feed so much as to induce a habit of storing up body fat. Give her at all times all the roughage she will clean up, without unnecessary waste (one cannot expect a cow or heifer to eat all the butts of corn stalks), and then as much grain as she will turn to good account through her udder.

For Cows to Freshen Next April.

Will you please formulate me a ration for cows large and small to freshen in April. Bran, $22; cotton seed meal, $29; corn meal, $23; have good mowed hay, oats cured green. E. B.
Manchester Depot, Vt.

First, give each cow what hay she will eat with good relish and without leaving any to be thrown away and wasted, and in addition, for each three pounds of milk one pound of a mixture in equal parts, by weight of bran and ground corn.

A Daily Average of 2 1-2 gallons of Milk Wanted—Distillery Slop.

We have a dairy of 30 cows and they are all fresh or about. Can we feed them so as to make them average 2½ gallons of milk per day, each, during the winter? What feed would you recomend as a milk producer? We have as our chief feed clover hay, shredded fodder, wheat bran and crushed corn. Also is it good to dampen the bran and corn with distillery slop as we can get that easily and how much of that ought to be allowed to each cow in quantity? We keep our cows up in bad weather and water in buckets. They get in general, good treatment. S. D. Co.
Xenia, O.

It would not be a difficult matter to feed and care for some cows in a manner to justify an expectation of 21.5 lbs. (2½ gallons) milk from each through the winter, but whether the cows in this herd belong to that class we cannot say.

We cannot advise feeding distillery slop in any amount to cows in milk. Every well regulated city has specific ordinances against such a practice, if there is any chance for getting that material.

For cows weighing 1000 lbs. and yielding 20 to 30 lbs. milk daily we should be disposed to try about as follows for average daily allowance.

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
15 lbs. clover hay	12.70	1.02	5.37	.26
8 lbs. shredded stover	4.76	.14	2.59	.06
4 lbs. bran	3.52	.50	1.54	.12
4 lbs. crushed corn	3.54	.32	2 67	.17
Totals	24.56	1.98	12.17	.61

Stock Foods.—Dilution Separators.

ED. HOARD'S DAIRYMAN:—As a reader of your valuable dairy paper, I would like to ask your opinion on the value of such stock foods as the International and the Prussian.

In an article on operating a Separator, taken from an Indiana bulletin, it seems to me the amount of fat left in the skim milk by the dilution and deep setting systems is too low for ordinary conditions. They are lower than figures given by some other reports.

On page 976 of your last issue is an article on this subject, which says that the loss by dilution may run from 1.08 per cent of fat to 2.0 per cent of fat. What is the average per cent of fat lost by this method in general practice? R. S.
Champaign, Ill.

In view of all the evidence concerning these much advertised stock foods we have not felt at liberty to join the various experiment stations in their wholesale condemnation. It is not claimed for them that in the amounts recommended for use there is any considerable nutritive value, but, as is the case with a good many medicines and tonics prescribed by doctors and the accompanying directions as to diet, etc., a little money paid out seems to insure better care in other matters, and thus indirectly, if not directly, they may accomplish very desirable results.

There is no denying but what they do impart an agreeable savor to the feed with which they may be mixed, and thus stimulate appetite. But apart from all this, or other matters which may be urged for or against them, the manufacturers make the fair proposition that any purchaser who is not satisfied with results, need not pay.

Nobody knows and nobody can ascertain what is the average loss of fat in the general use of dilution separators, but that it must be excessive has been abundantly demonstrated by carefully conducted experiments.

A Wisconsin Herd Record.

ED. HOARD'S DAIRYMAN:—In response to your request that dairymen send in the yearly performances of their herds, I enclose the butter yield of the "Richmond Guernsey Herd" for the year ending Nov. 30, 1903.

There has been some variation in the number milked, owing to the sale of cows, and the calving of heifers; but 17 cows is approximately correct. This number includes 7 two-year-olds milking with first calf, and one cow kept for progeny.

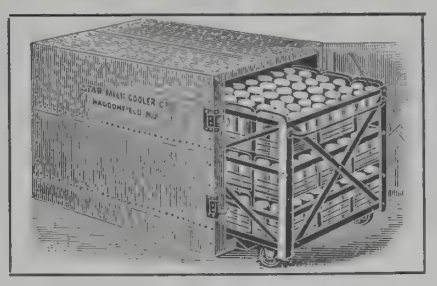
During the year they produced 5,555.25 pounds of churned butter, or an average of 325.6 lbs. per cow. The most careful estimates of the whole milk fed to calves and used in the household show that had the entire product of the herd been manufactured into butter, that the yield would have averaged at least 340 lbs. per cow.

The butter was sold at ½ cent below the Elgin market until Nov. 1st, since when full Elgin prices have been paid; $1,231.96 has been received from the sale of butter, or an average of $72.47 per cow, exclusive of butter used in the household. The winter ration of the cows consisted of an average of 7 lbs. grain, principally bran and ground barley, equal parts, by weight. In the case of extra heavy milkers, 10 lbs. of this grain and 1 lb. oilmeal were fed.

Their roughage consisted of all the mixed hay and silage that they cared to clean up. In summer they had excellent blue grass and white clover pasture, supplemented with a little grain. Silage was added as the season advanced. They were sprayed daily during the fly season with a preparation of Zenoleum. At present we are feeding silage composed of corn and soy beans grown together; cured sorghum forage. and about 4 or 5 lbs. mixed hay for roughage. We hope to have some alfalfa hay next year.

Our favorite grain feed is the barley and bran mixture, with a little oil meal. We are feeding it to young calves with satisfactory results.

Any one who applies the teachings of the DAIRYMAN in a practical manner can milk cows profitably.



BEN CLARK & SON.
Whitewater, Wisconsin.

Did You Ever Keep a Record Of Your Cows?

IF SO, you have felt the need of a convenient, simple and handy Record Sheet. We have had so many requests for these Record Sheets that we concluded to get up one that would "fill the long felt want." We have a very simple and complete Record Sheet for 10 cows, one month, that is printed on heavy Manilla Paper, we can send postpaid at following prices:

Price 5c Each	6 for 20c	12 for 30c	25 for 50c

SIZE 10x16 INCHES

We also have a one cow Record Sheet, heavy Manilla paper (one month) that we will mail postpaid

Single Copy 5c	5 for 15c	10 for 25c	25 for 40c

SIZE 6x15 INCHES

HOARD'S DAIRYMAN.
FORT ATKINSON, WIS.

The Distribution of Skim Milk.

It is known that the just complaints of creamery patrons on account of unfair distribution of skim milk are the bane of the separator creamery business. Further disputes among patrons, annoyances to managers, hindrances to the best work of buttermakers, watering the skim milk, and many other ills in the same train are unnecessary, since the

Barber-Coleman Check Pump

has for more than five years been successfully solving the problem in many different creameries. When a patron has dropped in his check he can pump the amount of skim milk called for by his check, less the percentage taken out as cream, so in like proportion to all other checks. Its measuring apparatus is just an ordinary pump which everyone understands and knows how to operate.

Ohio Dairymen's Association.

ED. HOARD'S DAIRYMAN:—The Ohio State Dairymen's Association will hold its annual meeting in Townshend Hall, Ohio State University, Columbus, O., January 27, 28, 29, 1904. Everything looks towards the banner meeting of the Association. The large room that is used as the agricultural museum, was about filled with dairy supplies and exhibits last year. This year, the entire space of this room has been taken up by applicants for space, and the adjoining room has been set aside for the over-flow exhibit.

The donation from the supply-men for the pro-rata fund has already exceeded that of last year. The following have given to this purpose:

Colonial Salt Company, Akron, O.....	$25.00
The J. B. Ford Co., Wyandotte, Mich ...	15.00
D. H. Burrell & Co., Little Falls, N. Y...	20.00
Heller-Merz Co., New York City.....	10.00
Diamond Crystal Salt Co., St. Clair, Mich.	10.00
DeLaval Separator Co., New York City..	10.00
P. M. Sharples, West Chester, Pa.....	15.00
Worcester Salt Co., New York City.....	10.00
Great Southern Hotel, Columbus, O.....	10.00
Total.....	$125.00

Last year, the Association guaranteed the pro-rata would be fifty dollars. The Secretary expects it to exceed $200 this year. If a good pro-rata fund will bring a large exhibit, a large number of buttermakers, cheesemakers, cheese-factory and creamery owners, we ought to have a crowd this year, at the meeting.

With the same number of exhibitors we have had in the past, the winners will probably get a larger slice of the good stuff than the winners in some of the other states, which have a very much larger pro-rata.

The program is to be supported by some of the best men the country affords and are, on the whole, the men that are known to take conventions right with them The program has not all been arranged yet, but it will soon be ready for distribution. D. A. CROWNER,

West Jefferson, O. Sec'y-Treas.

Waiting for the Oleo Decision.

ED. HOARD'S DAIRYMAN:—Another chapter has been added to the history of the dairymen's fight to protect their industry from the encroachment and fraudulent sale of a spurious substitute for the product of the dairy.

In the argument just finished before the Supreme Court in which the oleo manufacturers seek to have our present oleomargarine law declared unconstitutional, another event is chronicled that in the end will go to make up the record of one of the most persistent and aggressive efforts by the oleomargarine manufacturers, met by the most determined resistance of the dairymen ever known. For five years has the conflict been waged through justice, district and federal courts, before state and national legislatures, and now before the Supreme Court—and yet there is no end in sight.

In the meantime, while awaiting a decision, one of the greatest industries in the country stands wavering and uncertain, not knowing just what to do. Seven thousand creameries in the United States don't know whether to branch out and increase their output or be prepared to put out the fires under their boilers, lock their doors and turn their attention to other lines.

Thousands of manufacturers of dairy and creamery machinery, with a vast army of workmen, don't know whether to go on and prepare for a big season's trade by making a big surplus of goods to supply a big demand, which is sure to exist, providing the fraudulent sale of oleomargarine can be prevented, or whether to await the result and have a shortage of goods for the coming season. Ten thousand commission men with their assistants, don't know whether to get ready for next season's trade by enlarging quarters or improving their facilities to better accommodate their trade, for the reason they don't know whether there is going to be any dairy business to do or not; and above all, hundreds of thousands of dairymen throughout the country are in the same condition of uncertainty as to what to do.

It matters not what the ultimate decision may be, the present uncertainty is working a great injury to the dairy and other branches of business depending upon it. This is a gloomy picture to draw of the situation, but the facts warrant it. While we have an abiding faith in the justice of our cause, and that right will prevail, still no one can read the argument of the eminent counsel employed to break down our law and have the same feeling of security and assurance that our position is absolutely secure, as he did before reading it.

The feeling of uncertainty arises probably more from the eminence and number of the counsel employed, than from any new point they made in their argument. The benefits of the law are apparent to us every day in the way the markets respond to every little shortage in receipts. There being no substitute to fraudulently take its place, all demands must be filled with butter, and, although we have just passed through a year of unprecedented large make of butter and when there was never known to be such an immense amount in cold storage warehouses, yet the consumptive demand is gradually drawing from these stores and at a small profit to the holders, and indications point to the fact that all will be used and leave the market in a good healthy condition for the coming year.

Is there any reason why the organization that has been instrumental in bringing about these results should not have the hearty and united support of the dairymen and dairy interests?

S. B. SHILLING,
President National Dairy Union
Chicago, Ill.

Cocoanut Meal and Nutrium.

ED. HOARD'S DAIRYMAN:—Referring to inquiry and answer concerning above feeds, in your issue of Nov. 27, it may be of interest to some of your readers to know that cocoanut meal can be obtained of the India Product Food Co., 50 Chatham St., Boston, Mass. Nutrium is a powder prepared by the National Nutrient Co, of Jersey City, N. J., and consists of skim milk evaported at a low temperature. This company also puts out the same article in granular form. The Experiment Station has used both of these substances in compounding milk substitutes for dairy calves. P. H. S.

Amherst, Mass.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—The Quotation Committee of the Elgin Board of Trade reported the official market firm at 25 cents. There were no offerings and no sales. The output of the district indicated a decrease of 3 per cent.

The former markets were as follows:

	Tubs sold.	*Price.*
Dec. 14, 1903.....	0	25
Dec. 15, 1902.....	0	29
Dec. 16, 1901.....	0	24½
Dec. 17, 1900.....	0	24½
Dec. 18, 1899.....	0	26

The annual caucus was held today, A. M. C. Todson presiding. The Nominating Committee was composed of H. H. Hopkins, chairman; F. B. Cornell, F. A. Carr. The following ticket was placed in nomination:

For Board of Directors—John Newman, G. H. Gurler, W. W. Sherwin, George Reed, M. Richmond.

For Committee of Arbitration—C. S. Kilbourne, A. Nolting, F. B. Cornell, J. P. Younger, D. C. Woolverton.

For Committee of Appeal—C. H. Potter, G. F. Oatman, T. W. Brennan.

The annual election occurs next Monday. H. C. B.

Elgin, Ill, Dec. 14.

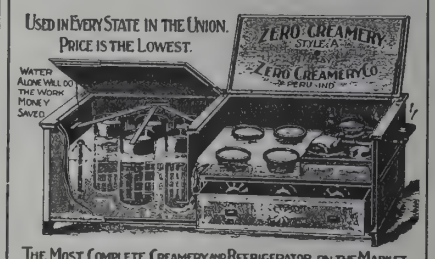
Milk Flow Shrinking.

A Remedy Suggested.

ED. HOARD'S DAIRYMAN:—On page 979, J. M. T. wishes to know what is the matter with his cows, which go off their feed soon after freshening, and are drawn up in the flank, with their eyes sunken.

Having had a number of cows similiarly affected, I would say that the treatment that has always given satisfactory results is Epsom salts, in quantities sufficient to thoroughly soften the droppings. If he will give physic immediately after calving, he will prevent the attack.

Gouverneur, N. Y. J. E. H.



Note and Comment.

Using a Smoothing Harrow on Corn.

ED. HOARD'S DAIRYMAN:—On page 997 T. R. W. asks about using a smoothing harrow on just coming up corn, if it is safe, and other kindred matters. Certainly it is safe, if the field is free of trash and small flat stones that otherwise would lodge among the harrow teeth and become little shovel plows. We harrowed our corn for years, before we ever owned a weeder, and use it now, more than the latter. The only trouble about the harrow on good soil is tearing up the corn by the roots and that because of hill and shallow planting, and that is avoided by rolling the land before marking and planting the corn full two inches deep. Right behind the planter run the weeder, and if the weather will warrant follow the weeder with the roller again to make soil compact, push small stones, etc. into the soil.

Keep watch of the sprouting corn, and when it has a good show of a root and a stub of a sprout, harrow the land and that kills a countless million of weeds that have sprouted on the surface and makes finer the surface soil. Weeds never germinate anywhere else. When the corn rows show, harrow again. Use the regular, straight tooth harrow with teeth set up and down, and never slanting. Do not have the teeth sharp. A somewhat dull tooth is the best. Drive lengthwise of the rows, drive very slow so that there will be no snap or jerk to the harrow, and then always harrow after dinner when the sprouts have been toughened. Night air and dew make them brittle and tender and easily broken off. Then the fine dirt both sides of the corn row made by marker, planter and

ILLUSTRATION

THE DE LOACH PONY SAW MILL.

The illustration herewith, is of a small size saw mill manufactured by the De Loach Mill Mfg. Co., of Atlanta, Ga., who advertise regularly in our columns. It is known as their Pony Saw Mill, which will run with as low as four horse power and cut a matter of 2000 feet a day, thus well adapting it to the individual lumberman's use. It can be operated as well with any horse power up to 20 and reach a capacity of 10,000 feet of inch boards a day. We give the illustration merely as a suggestion of the business of the De Loach Company. They manufacture a long line of mills of all capacities. They have the largest saw mill manufacturing plant in the world, and being located in this new southern city where labor is cheap, and the best materials of every character are abundant, they have every facility for turning out, as they undoubtedly do, the best line of saw mills in the world at low prices. They also utilize this wealth of resource to the full in making shingle, lath and planing mills, edgers, water wheels, grinding mills, gearings, etc. It is a good concern to look to for every article of machinery of this general character. A large saw mill and a general machinery catalogue giving detailed information will be sent free to any one writing for it.

roller will comb in very nicely about the sprouts and few will be injured.

Now, within the next four days cultivate, and put a cross bar onto the cultivator, so that by no chance it can go into the soil over two inches. The next time use the weeder and again the cultivator, and then for the last time the harrow and from then on alternate weeder and cultivator. About six of these alternate workings will give an acre of corn what may be called perfect culture, and the six workings with weeder, harrow and cultivator combined, need not require over five to six hours, half as long as one hand hoeing, and the weeder and harrow have done six men's work in weed killing, and that is all we cultivate for anyway—the rest is incidental.

Ohio. JOHN GOULD.

DAIRY MARKETS.

ELGIN, Ill., Dec. 14—Butter ruled firm on the Board of Trade this afternoon, selling at 25c a pound, the same as last week. Sales in the region for the week were 450,000

CHICAGO, Ill, Dec. 14—Butter—Steady; creameries, 16@25c; dairies, 14@21c.

Cheese—Steady; Daisies, 10¼@10½c; Twins, 10c; Young Americas, 10½c.

Eggs—Firm; at mark, cases included, 25@27½c.

Cattle—Choice to fancy beeves, 1,200 to 1,400 lbs. 5.25@5.75; good to choice heavy steers, 4.50@5.00; fair to good export and shipping steers, 4.40@5.10; medium beef steers, 4.00@4.30; plain beef steers, 3.65@3.90; common to rough, 1,000 to 1,200 lbs. 3.30@3.60; good to fat heifers, 3.85@4.10; good to choice feeders, 3.35@4.10; good to plain stockers and feeders, 1.75@3.25; fair to good cows and heifers, 2.70@3.70; good cutting and fair beef cows, 2.20@2.60; common to good canning cows, 1.25@2.10; bulls poor to choice, 2.40@4.35; calves, choice to fancy 4.50@5.50; calves, common to fair, 2.50@4.25; corn-fed, western steers, 4.00@5.35; Texas bulls and grass steers, 2.75@3.80; fed Texas steers, fair to choice, 3.40@4.50.

Hogs — Good to choice heavy packing, 4.00@4.70; fair to good heavy packing, 4.50@4.65; rough and common heavy mixed, 4.35@4.45; assorted light, 150 to 195 lbs., 4.45@4.62½; good to choice butcher weights, 4.55@4.70; fair to choice light mixed, 4.40@4.60; thin to choice 50 to 120 lbs., 4.05@4.40; stags and rough lots, 3.00@4.15.

MILWAUKEE, Wis., Dec. 14—Butter—Creamery, extras, 25c; firsts, 23@23½c; seconds, 21@22c, renovated (process), 18@19c. whey, 10@12c. Dairy fancy, 19c; lines, fresh, 16@17c; packing stock, 13@15c; grease, 5@6c.

Cheese—American full cream, new: Twins, 10@10½c; Young Americas, 10½@11c; Daisies, 11@11½c; Longhorns, 11@11½c; low grades, 7@9c. Brick, new, fancy, 10@10½c; low grades, 7@9c; Limburger—New, fancy, 10@10½c; off goods, 8@8c Swiss—Drum, choice, 12@12½c; Drum No. 2, 10@11c; block, choice, 11@11½c; block, No. 2, 9@10c.

Eggs—Strictly fresh laid, loss off, cases returned, 25c; strictly fresh laid, at mark, cases returned, 22½@23c; storage, city, Apr. No. 1, 23c; storage, country, 20@21c; dirties and seconds, 19c; checks, 17c.

MANITOWOC, Wis. Dec. 9—Cheese—Sales on the Dariy Board were: Forty-five Twins at 9¼c, 350 boxes Young Americas at 9¾c, 600 boxes Daisies at 10¼c.

ST. LOUIS, Mo., Dec. 12—Butter—Extras, at 26c; firsts, 23c; seconds, 20c.

Cheese—Cheddars, at 11½c; Young Americas, at 11½c; Twins, at 11½c; Daisies, at 12c; Long horns, at 12c.

Eggs.—Firm and scarce at 27@28c.

NEW ORLEANS, La., Dec. 11—Butter—Extras, 26@26½c; firsts, 23c; seconds, 20c.

Cheese—Young Americas, 12c; Twins, 11c; Daisies, 11½c.

Eggs—Fresh, 30c; storage, 26@27c.

PHILADELPHIA, Dec. 14—Butter—Firm; good demand; extra western creamery, 25@25½c; near-by prints, 27c.

Cheese—Steady but dull; New York full creams, fancy, 11¾c; choice, 11½c; fair to good, 10¾@11¼c.

Eggs—Strong; 2c higher; fresh near by, 34c; at the mark; western, 34c, loss off; southwestern, 33@34c; southern, 31@32c.

KANSAS CITY, Dec. 14.—Eggs—Fresh, 28c.

Butter—Creamery, 21@22c; dairy, fancy, 20c.

BOSTON, Mass., Dec. 14—Butter—Creamery, western, extra, 24@24½c; western firsts, 22c; storage, 21@23c; dairy, 15@19c; western ladle, 14@15½c; box and print 16@25c.

Cheese—Choice, 12c; Wisconsin Twins, 11@11½c.

Eggs—Fancy nearby, 40c; western 26@32c; poor to fair, 20@25c; dirties, 16@22c; refrigerator, 21@26c.

NEW YORK, Dec. 14—Butter—Recipts, 5,442 pkgs.; steady; extra, creamery, 25c; creamery, common to choice, 16@24½c; state dairy, 15@22c; held creamery, 16@22c.

Cheese—Receipts, 2,047 pkgs; quiet; state full cream, fancy, small, colored, September, 12c; late made, 10c; small, white, 12c; late made, 10c; large, colored, September, 12c; late made, 10c; large, white, September, 12c; late made, 10c.

Eggs—Receipts, 4,088 pkgs; strong; state and Pennsylvania, nearby, average best, 34c; state and Pennsylvania, seconds to firsts, 28@32c; western seconds, 28@30c; western firsts, 31@32c; refrigerated, 23@27c.

NEW YORK MARKET.

NEW YORK, Dec. 12—Butter—Receipts for the week, 32,269 packages. Exports for the week, 926 packages.

Conditions were about the same as last week, with perhaps a trifle easier feeling on all grades of freezer butter. Fancy fresh creamery was marked up a half cent early in the week and later dropped back to 25c and at the close there is more of this style butter in stock than any time this winter and prices are barely steady. June goods have been freely offered all the week and some full sales are reported at 21 to 21½c, but the general market is dull ahd lifeless with some goods selling at 20 to 20½c.

Market closes with big stocks of all grades butter and prices in buyers' favor. We quote:

Creamery, fresh, extra, 25c; medium, 22@24c; poor, 18@21c; creamery, 'June extra, 22c—; medium, 20@21c; poor, 15@18c. New York Dairy, extra, 22@23c; medium, 18@20c; poor, 14@17c.

Cheese—Receipts for the week, 32,707 boxes. Exports for the week, 6,991 boxes.

The receipts were heavy this week, but were largely made up of November make full creams and skimmed cheese; these kinds were pressed for sale, home buyers taking the full creams at 9 to 10c, and exporters paid 3 to 9c for very poor to very finest skimmed cheese. Fancy September cheese are firmly held and are only offered to buyers willing to pay 12c, and some special marks are held a fraction higher. We quote:

Full cream, extra, 12c; medium, 10@11c; poor, 6@9c.

Eggs—Receipts for the week, 36,415 cases.

High prices have curtailed the consumption and the demand is very light and prices easier for all grades. We quote:

New York & Pennsylvania, new laid per doz., 30@33c; Northern & Western, new laid, 30@31c; all sections, poor to good, 20@28c. refrigerator poor to good, 18@26c.

BALTIMORE MARKET.

BALTIMORE, Dec 10.—Butter—There is very little, if any, change to note in the condition of the market this week. A continued scarcity of all desirable table grades still prevails, and it would not be surprising to see still higher prices. Many seem to be of the opinion, however, that stock is high enough, and a further advance would prove detrimental. There has been considerable inquiry for fancy Junes and other desirable held creameries. Imitation creamery continues in light supply. Ladles, when the quality is satisfactory, find ready sale at full values. Rolls—All fresh, sweet, nicely handled stock is eagerly sought after. Packing stock is in moderate receipt; all good to choice offerings meet ready sale. Blocks and prints—Choice to fancy invoices are in quick demand. The market in general closes in good shape and very firm on all desirable offerings.

Creamery separator, extras, 26c; firsts, 24½@25c; seconds, 20@23c: Held creamery, extra, 24@25c; firsts, 22@23c; seconds, 18@21; imitation creamery, extras, 20c; firsts, 18@19c; seconds, 14@16c, Iowa & N. W, Ladle, extras 16½c., firsts, 15@15½c; seconds; 13@14c; Ohio & Indiana Ladle, extras, 16c; firsts, 15c; seconds, 13@14c Roll Ohio, extras, 17c; firsts, 16c; seconds 13@14c Roll, W. Va., firsts, 16c; firsts, 15c; seconds, 13@14c. creamery blocks (2 lbs.) extras, 27@27½c; firsts, 25@26c; seconds, 22@24c. Creamery prints, (½ lbs.), extra, 28c; first, 26@27c; seconds, 22@24c; Md, Va. & Penna prints, extras, 26@27c; firsts, 23@25c; seconds, 19@22c. Renovated butter, extras, 19c; firsts, 17@18c; seconds, 15@16c.

Eggs—At the time of our last issue the market presented a rather unsettled appearance; but since that time, with the receipts of strictly fresh laid eggs very light and quite a good demand at 30 cents, the market appears to be in better shape on choice to fancy stock, while held and mixed are in ample supply and have to be sold at slightly reduced prices in order to prevent accumulation. Storage Eggs—The supply of choice to fancy stock is pretty well exhausted, but stock of medium quality is very much in evidenc and slow sale. G. M. LAMB & BROS.

301 Exchange Place.

SAN FRANCISCO MARKET.

SAN FRANCISCO, Dec. 7—Business throughout the market for Dairy Products was quite seriously hampered yesterday by the closing of many of the largest public eating places and the general tone was more or less easy. Jobbers purchasing limited quantities of the better grades of butter for the family trade furnished the principal movement noted during the day. While prices for this quality of stock showed no marked reductions a certain easiness was apparent and the top rate was only obtained for a few of the most favored brands. The market for the under grades, and the qualities used by the restaurant trade, was depressed, with values irregular and holders endeavoring to urge business by accepting almost any reasonable figure. In the market for eggs trading was sluggish, and while the top quotation was still obtained in a small way for extra ranch, large buyers readily filled orders with 52c as the extreme. Cheese was quiet at former prices.

Receipts yesterday aggregated 25,000 pounds butter, 665 cases eggs and 4,700 pounds of cheese.

Butter—Creamery, extras, 28@29c; good to fancy, 25@27c; dairy, extras, 23@24c; dairy, choice, 21@22c; store, 18@20c; California storage, 24@27c, eastern creamery, 23@25c.

READING NOTICES

All Reading Notices under this head are at the rate of 25 cents per line.

Do You Want—A Hay Fork Returner? Every farmer having a barn should have one. A hummer for agents. Circulars free. ROONEY RETURNER CO., Box D, Independence, Ia. 50-tf

For Sale or Rent—Dairy farm of 200 acres, 90 improved. $1.50 per hundred for milk year around. Address J. P. SOUTHARD, Harbor Springs, Mich. 42-10

For Sale—10 cheese factories, 5 farms 40 to 160 acres, saloon, dance hall and store. FRED HADLER, 775 Ida St., Appleton, Wis. 43-tf

For Sale Cheap—Milk route retailing 200 quarts a day at 6 cents a quart. Net proceeds $150 per month. A splendid business opening. Apply J. L. FISHER, Janesville, Wis. 43-3

Wanted—A man to manage a dairy and farm of two hundred acres. Good milk route, complete outfit of stables, silo, milk room and water supply, most conveniently arranged. Adjoining city limits. Applicant must have some capital and satisfactory references. Address R. E. D., care Hoard's Dairyman. 44-2

For Sale—Four officially tested Holstein cows, also two yearling bulls. Sire and dams, advance registry. FRANK BREWSTER, Bowers, Wis. 45-2

Wanted—A competent man with three or four good milkers in the family to care for a dairy of 50 cows, commencing the first of the year. Write to me at once. Ship milk. A. P. BOOTH, Festus, Mo.

Would like to engage with creamery wanting butter maker, or creamery wanting traveling salesman in creamery supplies or agricultural line of any kind. References furnished. Address W. C. S., Box 118, Mohawk, N. Y.

Rare Opening—Controls Southern Piedmont, city of 25,000. Suburban dairy farm, herd, stock and complete outfit. Wholesale contract at fancy price. Sell all or half. Owner disabled. Write to "PIEDMONT," care Hoard's Dairyman.

Wanted—Position by single, middle aged man who understands dairying in all its branches; butter and cheese making included. Address P. R., care Hoard's Dairyman.

For Sale—Cheese factory, complete. M. S. MORSE, Williamsfield, Ohio. 45-4

Wanted—An experienced man, good milker and willing to work, on a dairy farm and other general work. GEO. A. STIVARIUS, Stitger, Wis. 45-2

O. Douglass has the cultures for butter and cheese making that take the prizes. They are the best yet produced. Send orders for free sample and instructions to O. DOUGLASS, 25 John St., Boston, Mass. 45-sp

The Third Revised Edition of Buff Jersey's Popular Book Just Out of Press—Ten chapters, 25 illustrations and right up-to-date. Subjects treated are: Silos and Ensilage, All Phases of the Dairy Subject, Soil Crops, Up-to-date Farm Machinery, How to Cure Abortion and Milk Fever, Some Medicines and Remedies, The Steam Plant, its care, and many other valuabe things ably treated. Send for circular. Sent post paid, cloth binding $1.00, paper 75c. BUFF JERSEY, Monmouth, Ill. 47-tf

For Sale—Two registered yearling Guernsey bulls. RAY BICKNELL, Ft. Atkinson, Wis. 32-tf

Sale of Guernseys—Ten heifers, two year olds and under. A rare lot. Send for circular. M. SAGER, Orangeville, Pa. 41-tf

For Sale—No. 3 Squeezer, Combined Churn and Worker, No. 7 Davis Swing Churn, dairy size Vermont Farm Machine Co.'s Butter Worker, 24 Bottle Turbine Tester, Milk Heater, Steam Pump, Weigh Can. All in first-class condition. ALEXANDER A. BRUSH, Danbury, Conn. 43-3

For Sale—In carload lots, fresh to forward springers. E. M. BOURNE, Wiota, Ia, 43-3

For Sale—Registered Ayrshire cattle, all ages, milking qualities unexcelled. Special prices on bull calves, 2 weeks to 9 months old, from grand cows. F. D. STOWELL, Black Creek, N. Y. 43-4

For Sale—Jerseys, 7 registered heifers and 3 registered bulls, from 3 to 10 months old. Solid color. St. Lambert strains. J. ALDUS HERR, Lancaster, Pa. 42-3

Jersey Bull For Sale—Dam's recorded test is 17 lbs. 4½ ozs. He is a grandson of Landseer's Fancy 29 lbs. ½ oz. in 7 days, 936 lbs. in 1 year. Has won four 1st premiums. Write for description and price. Also two half grown Collies. J. BLACK, Bremen, O. 42-tf

Milk Business For Sale—A 70 gallon milk business for sale at a bargain if taken within the next six weeks. No cows, all milk bought. Address W. M. T., care Hoard's Dairyman. 44-2

Wanted—Practical dairyman of experience. One who thoroughly understands feeds and feeding and can feed for profit. Must be sober, good milker, active, and willing to work. State wages and experience and give references. Address CHAS. E. POLLEY, Van Tassel Farm, DuBois, Pa. 44-2

Wanted—Position as superintendent by practical farmer, dairyman and breeder, or will take farm on shares. E. R. AUSTIN, Three Rivers, Mich. R. F. D., No. 2. 44-2

Feed Protegran—For economy and best results. Write the DEWEY BROS. CO., Blanchester, O. 44-tf

Wanted—Position in New York or Vermont by experienced cheese maker. Best of references. CHAS. R. CONANT, Gransville, N. Y.

Wanted—Position by experienced young dairy foreman. Married. Understands hogs thoroughly. Best of references. Address L. O. U., care Hoard's Dairyman.

For Sale Cheap—One 10-h. p. verticle boiler, one 8-h. p. verticle engine, one 2-roller Milwaukee one 4-roller McCormick corn husker, also portable steam sawing engine. Write for price and particulars. A. ZWEIBLE, JR., Burlington, Wis.

Dairy Questions Answered by Prof. Farrington.

TEST OF SALT.

"We have recently had a couple of barrels of new salt. From ordinary observation of this salt it seems to be all right. We have kept very close tab on the amount of butter sold and cannot see but what a ounce of it salted as much butter as an ounce of any other salt we have used. We have, however, made a test on which I would like your opinion. It was made as follows. We placed a teaspoonful of salt of each brand in glasses and dissolved them in water. We notice that one salt gave a much clearer brine than the other. I should like to know if the cloudy brine indicates that that salt has more impurities than the other. We presume these are minerals, such as gypsum, lime or something of that nature. Now the question arises with us, are these minerals detrimental to the butter and if so in what way? I am of the opinion that if they are tasteless and odorless they will not impart any bad flavors to butter or cause any defects to develop in the butter on account of them. Can you give us any information on this subject?" * * * *

Johnsons Creek, Wis.

The cloudy appearance of brine formed by adding water to salt does not necessarily show that the salt contains more or greater impurities than other samples which may show an entirely clear brine. The slightly milky appearance which is produced by disolving some salts in water is probably caused by a little sulphate of lime. This of course is not salt but very small quantities of it will not necessarily introduce any bad flavors into the butter or be of any particular damage to the quality of the butter. Salt may contain some injurious substances which will completely dissolve in water and give a perfectly clear brine. It is not, therefore, safe to conclude that the simple dissolving of salt in water and noting the clearness or cloudiness of the brine will show which one of the two salts is better that the other. Magnesium chloride is entirely soluble in water and its appearance in salt will not be shown by producing a cloudy brine when it is dissolved. This substance, however, is much more injurious to salt than sulphate of lime which will not dissolve in water and may be the cause of a cloudy brine. This test is not an absolute proof of good or bad qualities in salt although salt which contains nothing but sodium chloride should give an entirely clear brine.

Questions regarding the exact purity of butter salts may be decided by having samples of them analyzed by some chemist. It is not safe to apply a general statement to all samples of salt but each one should be considered by itself.

COMBINED CHURN VS. TABLE WORKER

"This creamery produces about 10,000 lbs. of butter per month and has for many years used a square box churn and Mason worker. A combined churn and worker has been suggested and I write to know if you will advise me whether such a change would be wise when butter is handled in such large quantities. We do not like to experiment in this matter nor disturb the very uniform, good quality which our butter now possess. What advantages, if any, are there to be obtained from a combined churn over the table worker? * * * *

Canton Ctr., Conn.

There are a number of factories in this state, making from 1000 to 3000 pounds of butter per day. In most cases they use the combined churn and worker with good results. I think you will have no difficulty in changing your practice from the old style box churn and table worker, to the use of a combined churn and worker, if you have a teachable man and one who is willing to learn from his own and other people's experience. The fact that these combined churns are extensively used in large factories in many places, is good evidence that they have proved to be satisfactory and do not injure the quality of the butter in any way. It is probable that a butter maker may not get butter of the same grain and texture the first few days he uses the combined churn, that he has been accustomed to get with the old table worker, but after a little experience, I am sure that he will find the combined churn and worker a very satisfactory machine to have in a creamery.

One of the principle advantages claimed for the combined churn is the fact that in the hot weather of summer time, the butter can be worked without exposing it to the warm air as is necessarily the case when it is worked on a table worker. If the cream is churned cold, and cold water is used to wash the granular butter, the hard, firm texture which the granules retain by such treatment may be preserved, by holding it in the combined churn and doing the working there instead of taking it out and exposing it to the warm air of a hot room.

Another advantage of the combined churn is the opportunity the butter maker has to give the butter a uniform amount of working each time he makes a churning, as he is able with uniform temperature and the same size in granular butter each time, to work this butter a certain number of revolutions of the churn and worker and in this way be more exact in the amount of working each lot of butter receives than is the case when he uses a table worker.

A COMPLAINT ABOUT RENNET.

We are sending you a sample of rennet in which it is reported there is some kind of acid that is not usually found in pure rennet. We sell large quantities of it and would like to know if this is true.

Is there an easy way to determine whether cheese color is annatto or aniline? * * * *

Sheboygan, Wis.

The sample of rennet you sent us has been examined and we find that it contains .43 of one per cent acid. This is about twice as much acid as the rennet we are using at the dairy school contains.

We have also made a comparison of your rennet with ours to note its milk coagulating strength and find that at a temperature of 85° a given quantity of your rennet coagulates milk in 54 seconds while ours will coagulate the same amount of milk in 42 seconds. We made several comparative tests at different temperatures and found in every case indications that the rennet you sent us is a trifle weaker than that we are using. A comparison of the two indicates that such rennet as you sent us should be used in the proportion of about four and one-half ounces to a thousand pounds of milk at this season of the year.

There is quite a difference in the acidity between your rennet and that we are using, but when we consider what a very small quantity of rennet is used in cheese making, that it is three to four ounces to a thousand pounds of milk, I do not see how it is possible to claim that this difference in acidity would have any appreciable effect on the coagulating power of the rennet. The amount is so extremely small that the difference in acidity will not probably have any effect on the milk.

It is not possible for us to determine whether the acid in your rennet is different from that ordinarily used in rennet extract. I do not know as the kind of acid will have much effect on the coagulating power of rennet. Lactic acid is sometimes used in rennet and the coagulating action of rennet takes place as readily in the presence of lactic acid as of muriatic and possibly other kinds.

There is no easy way of determining the difference between annatto and aniline colors that I know of. They are both organic compounds and while the difference between them may be discovered by an expert analyst, no factory method which may be applied by the general public has been suggested up to the present time.

IS MILK BENEFITTED BY THE SEPARATOR?

Can you tell me what is the composition of the substance which is deposited in separator bowls when milk passes through them? Is this substance a normal element of pure, healthy milk, essential to its natural condition or is it a foreign substance? Does its removal in any way benefit the quality or condition of the milk and improve it as an article of food? Have you ever made an analysis of this bowl slime and if so, what does it contain?

Does running milk through a separator improve it for bottling? Would you advise running the milk directly through a separator while it is still warm from the cow, or should it be cooled, aerated and then warmed up a second time for separating? What is the best plan for mixing the cream and skim milk as it comes from the separator so as to get the most perfect fusion of them into milk?

If milk has been properly drawn in hygienic and sanitary pails, thoroughly strained through many wire strainers, cloths, and absorbent cotton, well aerated and cooled after it is drawn, do you still consider it necessary or advisable to run such milk through a separator to clarify it?

Ashville, N. C. * * *

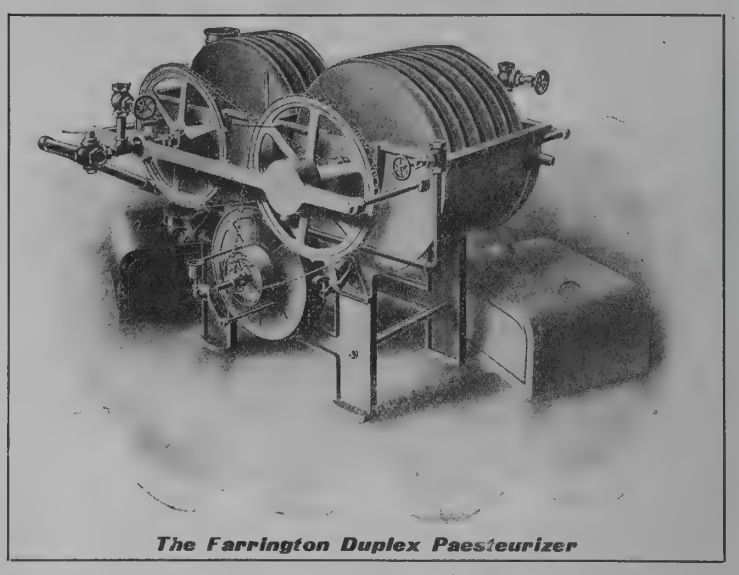
The questions you ask in regard to milk would require a letter of considerable length to answer them in a satisfactory way. I may say briefly, however, that many analyses of separator bowl slime have been made and you can find them in reports of the different experiment stations. The substance which separates is highly nitrogenous in character and it is removed from the best and cleanest of cream. It apparently is a natural constituent of milk but it is in suspension and being somewhat heavier than the other constituents is deposited in the bowl instead of passing out with the skim milk or cream. There is such a small quantity of it present in the milk that I do not think its removal changes the food value of milk to any extent.

It does improve milk to run it through a cream separator, especially if it is to be bottled and sold at retail. This improvement is undoubtedly caused by the aeration which the milk receives when running through the separator.

I certainly should run the milk through a separator immediately after it is drawn from the cow and while it is still warm. This is much better than to allow the milk to cool and then warm it for separating. The skim milk and cream spouts of the separator are so turned that the cream and milk will both run into the same can and mix as fast as separated.

It has been found that milk which has been obtained under the very best conditions, where sanitary milk pails, absorbent cotton, etc., are used, may be improved by running it through the separator. The reason for this is found, I think, in the thorough mixing of the air with the milk which is done by passing it through the separator.

E. H. FARRINGTON,
Wisconsin Dairy School.



Note and Comment.

The Dual-Purpose Cow is Found.—Prof. Decker and the Ohio Dairy School.—The Farmer's Life and the Help Question.—Silage vs. Shredded Fodder—Continuous Stabling.

ED. HOARD'S DAIRYMAN:—Ewereky! it are found—the dual-purpose cow! No mistake about it, as the receipt for the same was given in a late, and most reputable stock journal, and more, the discovery of the process of breeding; and maintainance of this "long felt want" in cows is credited to Wisconsin, and not so very far from the DAIRYMAN office. It's awfully simple, when you come to know about it; and once in possession of, the farmer at once has a flow of milk going to the creamery, and a line of prime beef going to Chicago, and the two revenues united beat Standard Oil stock. To accomplish this, you need a dairy of good Short-horn cows and get a Jersey sire of approved breeding and cross on this dairy; raising all the best heifer calves, and in time breeding them back to their own sire. These heifers in turn are to be bred to the best type of Short-

horn bull and his get bred back to him, and then a Jersey bull is to be again introduced and two breedings made to him. By that time the characteristics are so firmly intermingled, that one gets great and persistent milk yields, embodied in a beef producing form, and the offspring of this herd, like wireless telegraphy, goes profitably in any direction desired.

It is hard to understand why Frank Coburn has not secured some of this double and twisted, all wool, and 44 inches wide, dairy stock for the St. Louis Fair. The DAIRYMAN would be doing a great service in giving its readers some representative half tones of this remarkable Wisconsin, dual-purpose stock, warranted not to revert, or untwist.

"Note and Comment" would be very remiss in its notes, if mention was not made of the splendid dairy work, and the already far reaching influence of Prof. J. W. Decker at the head of our Ohio State University Dairy School, and the newer impulse he is giving to the dairy life of the state. Ohio as a dairy state—well, better say section—is somewhat "sot" in her traditions, and it needs a heap of teaching and preaching as well as example to turn her from old customs, but I think Prof. Decker is being recognized more and more as the coming dairy prophet, and his methods and practices endorsed. The dairy school under him is sending out classes of bright boys, and even older men, each of whom will carry the better ways learned to their localities, and the result is that the dairy sections are becoming "deckerized" to a noticeable extent, and no one is more willing to acknowledge the fact than the writer who has watched with interest his growing popularity, and with pleasure, and his coming to Ohio with more than common welcome.

A recent writer says that there are many compensations in a farmer's life,—fresh air, pure water, garden sass fresh from the soil, no strikes, anarchy is afar off, and he is outside of the "ring" where the strife between labor and capital is going on. That's all true, but it is not a compensation, when the tax man comes around, or when he wants hired help in, or out of doors. The rush to the city where all of the mentioned evils are being exhibited, is going on without abatement. This morning I counted twenty-five of the young men and women of our town going to the city-commuters to their "situations"—they do not call it work, and twenty-five more have previously gone, and to stay. It is an impossibility to-day to hire two good men in this vicinity.

It's all "shop talk" now, and it's having a serious effect upon the dairy industry, getting reliable hired help, and dairies are being reduced, and given up entirely, because of this exodus to the city. Can the city forever keep on devouring and assimilating this human offering, so largely sent from the farm? That now and then a millionaire comes to the country and sets up a "country seat," and spends thousands in establishing it, is no solution to this perplexing labor question. It actually adds to the scarcity of help, and the dairyman's discomfort.

Says one: "Break in the new emigrants." Yes, but if broken in, they quickly leave, and its more profitable to sell the dairy than to make dairy help out of wild Italians, Magyars, and unspeakable Turks. I can see as much clear sky as any one, but this farm help problem is unsolved, and I see no solution of it in sight. Who can see ahead?

The fellows who are still "agin" the silo as the best way to preserve the corn crop, are having their "whirl" about here this winter with shredded corn fodder, and the shredders were, and still are pretty busy. The feeding results are varied. Northern Ohio conditions of atmosphere are against the perfect curing of shredded fodder, necessary for its good keeping. A fine field of fodder near me was shredded into the big mow of the barn, and its sequel is best told in the words of the owner: "It began to mould right away; dried off the cows; and don't make very good bedding. It's the last I'll ever shred."

Yesterday a silo that had been emptied of its silage, was filled with shredded fodder. It was not wet down more than what moisture it would get from the snow that came from the field with it, and I shall watch the outcome carefully. I think the cost of cutting, and shocking in the field, and the after shredding and help—as shredding is so much slower a process, is as great as silo filling, and the wastage is about as great as when uncut fodder is fed, and in the instance noted, it turned out all waste, and all of this experimental bother, and often loss, is to try and get around building a silo, and owning up that your way is not as good as silage making. Some one has said that "it costs more in effort to keep out of heaven, than to attain it."

I want to thank Fred Schlappi for his defence of continous stabling of cows. I am sure that the real need of exercise, comes more from lack of ventilation and plenty of light, than any constitutional demand for it on the part of the cow. Yesterday a noted cow man was at the stable looking at things. "How long have these cows been in here?" "About two weeks." "Why, I do not detect any cow smell, or odor, how do you keep it down?" I don't try to keep it down. I take it up as fast as it forms, if it can form with dry floors and absorbents." "Tell me how," and we took him round to the floor-opening ventilator, and the indicator was telling as plain as it could, that the shaft was taking up about 1,000 cubic feet of air an hour. "Why, that's pulling all the time, isn't it?" "Yes, that's what its for." "How warm is it in here?" Just fifty now. It won't vary six degrees from that any time this winter. "Why won't it?" Well, all I know about it is that a well, floor-ventilated apartment, will be warmer, and at a more uniform temperature, and maintained with less fuel, than a room unventilated.

This floor ventilator is drawing off and up the shaft the damp, heavy air. The evaporation from a cow's body and breath, is about seven pounds a day from these two sources alone; carry this off as fast as produced, and before it has time to condense, and you have dry air. The intakes provide fresh air as fast as wanted, and you then have the proper conditions of warmth, and uniformity without chills, and extremes of temperature." Then he looked the cow veterans over to find bunches, spavins and knee boils, but returned gameless. "Water in front of the cows, silage pits not 30 feet away, and clover in the mows. Well, what do they want to go out for, after all?" I do not know, and for 15 years with all sorts of variations of the experiment, I have not been able to find out. To do this, one wants a stable floor of the best, with much bedding, sunlight, easy, comfortable ties, no ice water, and regularity in all care, milking and a study of cow individuality.

A Strange Malady.

Was it Caused by Corn and Sorghum Silage?

ED. HOARD'S DAIRYMAN:—Your answer to my letter did not say anything about the acetic acid in the ensilage, mentioned in the clipping sent you in my letter of inquiry. I have a matter of great importance to ask you about. This has happened since I wrote to you as referred to above. I built a hundred ton silo this summer; put corn and sorghum into same.

I commenced feeding that about two weeks ago; noticed nothing out of the way for about ten days, when some of my cows commenced to get sick. I never had cows act as they do now. Stopped feeding the silage four or five days ago. I will state that some of my cows ate the silage from the start, some ate some of it and some would not eat any at all. However, I first noticed four or five cows acted stiff, staggered about, trembled and the flank twitched continually. They did not refuse to eat. Partly dried up, and would fall down.

One got down and could not get up. After she had been down about a day I had her lifted up and braced up in stall so she could not get down, and is there now; shall take her out tomorrow and see if she can get about. I stopped feeding the silage and no more have taken the same complaint and those not badly affected are getting better. If I cannot use this silage I shall be at great expense this winter to buy grains, and have from first to last spent about $500 in building and filling this silo.

I was somewhat afraid of sorghum and had heard of the bad effects when fed green, but all my inquiries left me devoid of any information about sorghum ensilage (I mean against it). I had F. W. Woll's book on silage, and on page 31 it speaks of sorghum as superior silage.

I may be wrong in laying this trouble to the silage. Another thing, my cows have always been eager to get into the barn at feeding time, but as they commenced to get sick they (none of them), would come, and they had to be driven into the barn and sometimes it was hard to get them in. Since I stopped feeding silage and feed bran and cotton seed meal they come as formerly. I am at a total loss to account for this state of affairs.

I have read HOARD'S DAIRYMAN for some time and had high hopes of my silo for this winter. Now I dare not feed the silage, although I shall take one cow and try it again. Some of the cows that I fed say 20 pounds to each day never showed any sign of being sick when I stopped, and some that I did not feed 10 pounds to, were more sick than any. Those that were the worst were strippers, except one. The symptoms are trembling, stiffness all over, reeling and falling about just as if drunk, and finally down and can not get up, although they have good appetite, and show no other signs of being sick. Kindly let me know if possible.

Ocala, Fla. G. B. T.

We are as much at a loss to account for this strange malady as our correspondent can be. The symptoms in a way indicate poisoning, but not necessarily. We find it quite impossible to think that the silage is the cause of the trouble, partly because only a part of the cows are affected, but largely because corn and sorghum silage has been fed elsewhere so freely and without any results of a similar kind. We have never heard of any silage being so sour as to be unhealthful, and it stands to reason that if the acid in this silage was in any degree objectionable, the larger amounts eaten should have shown the most effect.

We do not feel at liberty to advise the indiscriminate and wholesale feeding of this silage under existing circumstances, but if the case were our own would experiment with it further in a cautious way and be governed by the developments.

A Washington Feeding Inquiry.

I am feeding my cows, grade Jerseys, 4 lbs. bran and shorts mixed, 2 lbs. oil meal, 20 lbs. of mangels, with all the oat and pea hay they will eat up clean. I feed the meal in the morning and the mangels in the evening. Am I feeding enough meal? T. L.

Seguin, Wash.

The best answer we can give to the above inquiry is to say, read carefully what we have written in reply to other inquiries.

At all events from the information furnished, we are unable to suggest any modification in the present style of feeding.

The Indiana State Dairy Convention.

ED. HOARD'S DAIRYMAN:—The fourteenth annual meeting of this association was held Dec. 10 and 11, 1903, at Plymouth, the county seat of Marshall county, situated on the Pittsburg & Ft. Wayne R. R., 84 miles southeast of Chicago.

The weather was fine and the attendance said to be larger than at any previous meeting held by the association. At times there were nearly 300 present and the interest was good, much better than it had been at meetings of this kind for several years past.

The state of Indiana has not been much

For Sample Copy of Jersey Bulletin address Indianapolis, Ind.
"IT'S UP TO YOU!"

of a dairy state, though there have been for many years some few first-class dairymen, but the majority of the farmers are engaged largely in grain raising, and those who kept stock paid more attention to producing beef than milk.

But now beef is low, hogs are low and they are beginning to realize that raising grain to sell off the farm is a ruinous business, and the effect of it is plainly visible on many farms that were once naturally very fertile.

Thus it comes about that the Indiana farmer is beginning to take a lively interest in the dairy cow, and many are beginning to think that after all it may be possible that she can be made to return the most money for food consumed of any animal.

The first subject was

THE DAIRY BARN.

Mr. M. J. Rippey of Syracuse led off with an excellent paper. He prefers a basement with a "half bank," but with windows all around once in 8 feet, and have a provision for ventilation. The barn should be wide enough to have a drive way between the two rows of cows. They should face outward with feed mangers next the wall. He has cement floors and cement gutters.

There was quite a discussion concerning cement floors, many claiming they were cold and often caused garget by a cow lying with her udder on the cold floor. But Mr. Rippey said he thought it was all right if plenty of bedding was kept under the cows.

"The Value and Use of One of the By-products of the Dairy," was Mr. D. B. Johnson's subject. The by-product he talked about and which he thought was much more important than any other, was the manure.

He handled the subject in a masterly manner. He is an old Farmers' Institute worker and a ready talker. He says save all the manure, both liquid and solid. Get it on the land as soon as practical after it is made. Use it as a top dressing for grass or winter grain. Do not put on too thick. From 6 to 10 loads to the acre is enough, but it should be spread even and fine with a manure spreader.

Mrs. Charles Lamont had for her subject "Building up a Dairy Herd." She had a very nicely written paper in which she told of their early struggles with poverty and with land impoverished with grain raising, and of their final success in building up a good herd and bringing back the fertility to the soil. Two years ago her cows produced 255 lbs. butter each, last year 290 lbs., and when this year, 1903, is ended she is quite sure the average yield, heifers and all, will be 300 lbs.

CREAMERY PATRON INVESTIGATION

Drew the largest audience of the convention. It had been well advertised that this subject would be up Thursday afternoon, and a great deal of curiosity had been aroused. Close attention was paid for an hour and half while this subject and the discussion was on. It greatly astonished many persons to see what a difference there was between intelligent dairying and careless work.

TROUBLES OF A RETAIL MILK DEALER

Was J. B. Calom's subject. He presented it in a very humorous style which provoked much laughter. He made some excellent points. If you want your customers to be prompt and not hinder you, you must be punctual with them, and be there at the same time every day. He said he had got his patrons so well trained that he was able once, when he timed himself, to deliver milk to 50 customers in 55 minutes. His milk, of course, was in bottles.

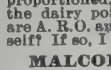
RIPENING CREAM.

This was talked by C. F. Hostetter. There was nothing particularly new brought out. He said an even temperature during ripening was essential. He had it 72 to 75, and when ripened cooled it down. A skim milk starter was good, but he was inclined to prefer some one of the commercial starters. Mr. Slater also talked on starters. He put in 10% of starter and ripened at 62 degrees. Always had the same temperature winter and summer.

Mr. Rippey said cream would ripen and make good butter without any starter. He was told that might do for a private dairyman like him, but it would not do for a creameryman to think of doing that way.

Prof. H. H. Dean, Ontario Agricultural College, gave a very interesting talk on making butter from pasteurized milk or cream. He preferred pasteurizing the milk before it was separated. At the college they had experimented with different temperatures from 140 to 185 degrees. He preferred the latter temperature. The milk was heated up to that and run through the separator hot. This made always very close skimming, and the skim milk was also pasteurized.

Wis. C. P. GOODRICH.



NO MORE RUBBING, stooping or boiling of clothes. The "1900" Ball Bearing Washer will wash a large tubfull of clothes in 6 minutes. An hour's wash in 20 minutes. The washing is done sitting down. HOLSTEIN CATTLE! The Choicest Milk and Butter Breed in the World. Write to WISCONSIN LIVE STOCK ASSOCIATION, Appleton, Wis., U. S. A.

HOLSTEIN-FRIESIAN BULL CALVES
Do you want one for use this winter which will improve your dairy herd? Do you want him elegantly proportioned, with straight back, high rump, and all the dairy points? Do you want one whose relatives are A. R. O. and eligible to the Advanced Register himself? If so, I have a choice lot, just such as you want.
MALCOLM H. GARDNER, Darien, Wis.

AS IT IS NOW TIME cattle should be housed we find we must sell thirty-five of our high-bred large producing Holsteins, as we haven't room to stable but 100 head this winter. Visit the Brookside Herd now and secure something choice.
We Guarantee Stock as Represented and to be breeders. Quality unsurpassed. Prices will be reasonable.
STEVENS BROTHERS, Lacona, N. Y.

STAR FARM HOLSTEINS
Mercedes Julip's Pietertje Paul 2d advertised last week is sold. Mercedes Julip's Pietertje Paul 3d has arrived and is for sale, sired by the Champion Bull Mercedes Julip's Pietertje Paul. Dam is an in-bred grand-daughter of De Kol 2d. She has just completed an official butter record. Write for tabulated pedigrees, markings, etc., today. First acceptance takes him.
HORACE L. BRONSON, Cortland, N. Y.
Grand lot of cows, heifers, bulls and calves for sale.

GREEN VALE HERD Offers Sir Mercedes De Kol, No. 27097, four years old, and bull calves sired by him from choice cows, best families. Write for prices.
M. F. PECK & SONS.....MARSHALL, WIS.

LOOK HERE
34 cows and heifers in the McGEOCH HERD have been officially tested with the following results: 10 cows average 20.26 lbs. butter in seven days; average per cent of fat 4.06. 7 four-year-olds average 16.82 lbs. butter in seven days; average per cent of butter fat 3.98. 9 three-year-olds average 15.06 lbs. of butter in seven days; average per cent of fat 3.50. 8 two-year-olds average 12.16 lbs. of butter in seven days; average per cent of fat 3.60. We have a few young bulls out of some of these cows, and sired by Gem Pietertje Hengerveld Paul De Kol, or Sir Ormsby De Kol for sale. One of these is out of a cow that made official record of 24.88 lbs. of butter in seven days; average per cent of fat 4.47. Are these the kind of Holstein-Friesians you wish? If so, can we not interest you in putting a bull from this class of stock at the head of your herd?
For particulars address H. B. Daggett, Mgr., Station A, Milwaukee, Wis. Residence: National Ave., near 40th. Phone, South 1601.

Stock Troubles.

HIDE BOUND.

ED. HOARD'S DAIRYMAN:—This disease in cattle is commonly due to indigestion or faulty feeding of some sort. In cases where it exists, the following remedy may be found of some usefulness: Give one pint of raw linseed oil. As soon as this operates freely, give warm bran mashes twice a day. In each add a tablespoonful of an even mixture of ground ginger, gentian and sulphate of iron.

This, with green feeding, will usually relieve the cattle in a short time. Costiveness is one of the most effective causes of hide-bound, and an active laxative medicine generally speedily leads to recovery.

CARE OF HORSES' SHOULDERS.

Horses' shoulders need attention during the hot weather. When the hardest work is finished the shoulders should be washed with salt and water, and the top of the neck where the collar goes, also. Wash them every night after the day's work is done; do not wait till the horse galls. Commence early, and may be you can prevent your horses from having sore shoulders.

Do not be afraid of the water, as a good, clean pail of water, with a handful of salt in it, is refreshing to a horse's shoulders as water is to a person's body.

If farmers would pay more attention to the fitting of collars to their horses' shoulders, and rub them when they are to work, and keep the mane out from under the collar, the shoulders would be less liable to get sore.

There is many a horse to-day has to work with a sore neck or shoulders, which, by a little care, could soon be made well. Get a pint of arnica and keep it in the stable, and after you have washed the shoulders, bathe them with a little of the drug.

There is nothing better than arnica to take out the soreness, and, for a gall on top of the neck, you can use pulverized black lead, or common stove polish, and have good results. Put it on dry. When you harness up in the morning, put a little on under the collar.

If we could only get collars to fit the shoulders snug, without sweat pads, I think we should have less trouble with galls. There can be no doubt but that a sweat pad tends to make a horse's shoulders tender, as it soaks up the sweat from the shoulder, and when a pad once gets wet through, you cannot get it dry again overnight. Then the more your horse sweats the harder your pad gets, and when it is hot and dusty, as it generally is through harvest work, the dust and grit collects on the pads, and the result will be, you will soon have sore shoulders to contend with. Now, if we had some good leather collars, kept them clean and discarded the pads, I think it would be better for both man and beast, as the sweat will not penetrate through a leather collar, like it will through a pad, as the cooler you keep your horse's shoulders, the less liable is he to gall.

There are some horses that will gall with the very best of care, no matter how careful you are of them, or how clean you keep their shoulders. In the spring we often see horses with what we call collar boils. These come from the blood being foul or the system being clogged. Saltpetre should be given in bran mash, to clean the system.

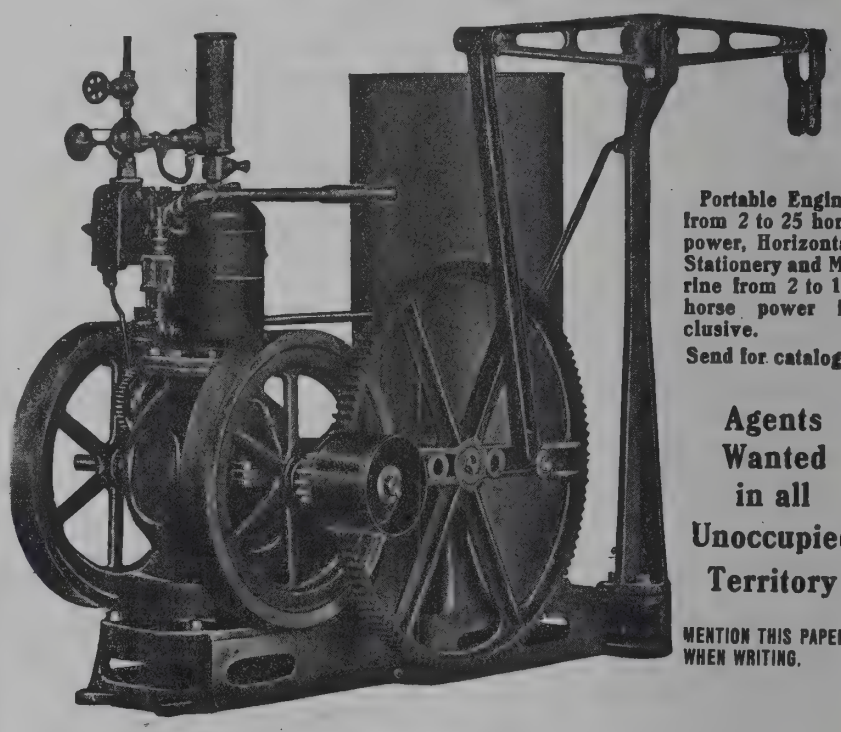
MILK FEVER.

In regard to this disease, Mr. Schmidt a Danish expert, seems to have been very successful with his method of treatment, as it appears that 86% of the cows which have been treated, have recovered.

Although the disease is still obscure, Mr. Schmidt believes that it is due to the elaboration of a poison in the udder of the cow. But, so far as I know, he has afforded no explanation of the reason why the poison appears more generally in the udder of cows of a given age, and why it is seldom found in the cow, which is kept on short commons a few weeks before calving, or when she has been drenched two or three times with such a purgative as Epsom salts. That young and old cows are seldom attacked, is a matter of common knowledge, and it is also well known that cows which are well bred, which are maintained in good condition, and which are between the ages, speaking broadly, of 5 and 9 years, are those which are most generally attacked.

To be ready for treatment, it is necessary to obtain 4 or 5 feet of ¼ inch rubber tubing, a glass pipette or tube, one end of which may be introduced into the teat, and a 3 inch funnel. The pipette and the funnel are attached to the rubber tube, one at each end. The cow, which is naturally lying in the usual posture recognized in this disease, and probably in a state of coma, is milked clean. The udder is protected from the stall floor by a piece of waterproof sheeting, and then thoroughly soaked with soap and water and rinsed with disinfectant or antiseptic fluid with which the instruments just referred to are also cleaned.

The pipette is introduced into the teats, one at a time, and a small quantity of a solution of iodide of potash is passed; 120 grains of iodide crystals are disolved in a quart of water which has been boiled and cooled to blood heat. In all probability the cow will soon show sign of returning consciousness and recovery; in which case she can be again milked in six or seven hours; but should there be no such change, the iodide may again be injected at the end of a similar period, but also



DON'T BUY GASOLINE ENGINES UNTIL YOU HAVE INVESTIGATED **"THE MASTER WORKMAN"**

A two-cylinder gasoline engine; superior to all one-cylinder engines. Costs less to buy and less to run. Quicker and easier started. Has a wider sphere of usefulness. Has no vibration; can be mounted on any light wagon as a portable. Weighs less than half of one-cylinder engines. Give size of engine required. Especially adapted for irrigation in connection with our centrifugal force pumps. (Sizes 2, 2½, 4, 5, 6, 8, 10, 12 and 16 horse power. Mention this paper. Send for catalogue.

ICE CUTTING is easy with DORSCH ALL STEEL, DOUBLE-ROW ICE PLOWS. Marks and cuts two rows at a time; cuts any size cake and any depth, and does it with ease and economy. Does the work of 20 men sawing by hand. Pays for itself in two days. No farmer, dairyman, hotel man or other can afford to be without it. Have a supply of ice and enjoy the comforts of life in the Summer. Ask for catalogue and introductory prices. JOHN DORSCH & SONS, 212 Wells St., Milwaukee, Wis.

Made in Three Sizes.

after clean milking. It is important that after the solution has been introduced, each quarter of the udder should be well rubbed upward, or massaged, that the iodide may be the better distributed. After the second milking, and in the case of partial recovery, it will be well to bathe the udder with pure water at a temperature of 160° Fah. This process it will be seen, is very simple, and can be performed by any one who will take the trouble to be careful in every detail, not the least being the passing of the point of the tube into the teat which is finely and delicately organized.

SEE TO THE HORSES FEET.

The horse's feet should be frequently examined, if he is to be protected from such accidents as the picking up of nails, glass and strips of metal of various forms and sizes. The frequency with which such accidents occur should cause increased vigilance on the part of those who handle horses.

If the horse steps on a nail, even though the head be up, he may catch it in a part of the foot that forces it out of the rotten board in which it was previously held. The next step of the horse drives the nail further into its resting place in the foot. The point of the foot that is most subject to such mishaps is the frog and the cleft just behind the frog. Not only metal but splinters of wood find their way into this vulnerable region, and become the cause of pain to the horse, with subsequent lameness.

It is fortunate for the horse if the injury is such that he shows lameness, thus leading to an investigation of the feet and discovery of the cause. But a good many times the injury is not sufficiently great to cause a show of lameness, but is great enough to cause pain to the poor beast, and that for days at a time. Frequently this is manifested by a disinclination to rest the weight on this foot when in the stable. In motion the pain is not sufficient to prevent the horse from putting his foot down as usual. Such injuries are found for the first time when the horse has to be rushed. Humanity should lead us to frequently examine the feet to see that all things are in a normal condition. W. R. GILBERT.

What Some Oregon Jerseys Have Been Doing.

ED. HOARD'S DAIRYMAN:—I am now milking nine cows, all grade Jerseys, except two, they being full bloods and registered. My income in ten months for the butter fat, at the creamery was $531.62. I have never figured what my family uses, but it would be a large amount. We churn our own butter and use lots of it; six in the family most of the time, besides lots of company; cream on the table every meal.

Have sold $100 worth of milk-fed hogs in this time, besides our own meat. Have vealed five calves off the milk, which brought me $30. I have four I am keeping.

My cost of feed for six months (as that is the length of time I feed), is $120 for chop, $12.50 for oil meal, $100 for hay.

Now, I would like to know what you think of this. Are these cows worth milking? D. P.

Carlton, Ore.

We estimate that these nine cows have earned somewhat over $90 each, and that the full cost of keeping for a full year will not exceed $33, or a net profit for the herd of over $500. This is not exactly a bonanza, a get-rich-quick business, but a fairly good profit. It means competence, health, self-respect, and good citizenship, which are better than great riches.

Adulterated Cotton Seed Meal.

ED. HOARD'S DAIRYMAN:—I send you under separate cover, a sample of cotton seed meal, upon which I would like to have your opinion as to purity. I applied test given on page 938 of the DAIRYMAN and came to the conclusion it is not pure. What I bought last, has no tags on bags as to analysis. The lot before contained tags, guaranteed analysis as follows:

Ammonia	4½ to 5 per cent.
Phosphoric acid	1¾ to 2 " "
Potash	1½ to 2 " "

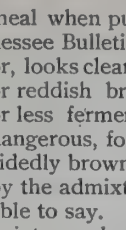
Both samples are the same if tested as above. An answer in the DAIRYMAN will be thankfully received. The meal cost me $28 per ton in Toronto. Do you think that too dear, if not pure? S. H.

Markham, Ont.

The sample is not pure cotton seed meal, but is a mixture of meal and hulls, the latter finely ground. "Cotton seed meal when pure," we quote from a Tennessee Bulletin, "is of a deep yellow color, looks clean and smells clean. If brown or reddish brown it has undergone more or less fermentation and is unfit, even dangerous, for food." This sample is decidedly brown, but whether this is caused by the admixture of the hulls we are unable to say. Waiving objections on this point, we should not consider it a profitable feed at the price named.

Michigan Educational Butter Scoring Contest.

ED. HOARD'S DAIRYMAN:—The Michigan educational butter scoring test, carried out under the auspices of the Agricultural College is now completed. Of the fifty-eight that participated, fifty were creamery butter makers and eight were private dairymen.

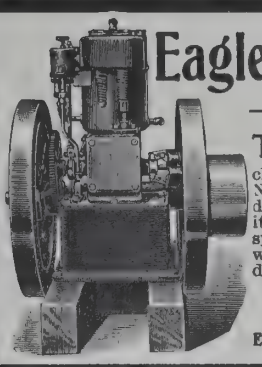


By a rather unlooked for coincidence two men tied for first place in the creamery class. This is a little unfortunate for the Governor who, at the time the test was inaugurated, very generously offered a gold medal for each of the victors in the two classes, and who now as generously offers a third gold medal to maintain the peace between the fortunate victors in the creamery class.

In the dairy class Mrs. James Harris, Traverse City, Mich., received the gold medal with an average score of 90.2.

The recipients of prizes in the creamery class are the following:

Helmer Rabild, Chesterfield Mich., Gold Medal Average score, 93.3.
L. J. Heaton, Dorr, Mich., Gold Medal, Average score, 93.3.
J. B. Gilbert, Zeeland, Michigan Diploma.
J. A. Smith, Manchester, " "
Walter Hall, Hilliards, " "
A. J. Walter, Keeler, " "
Jesse W. Cobb, Lawrence " "
B. C. Martin, Concord " "
F. E. Stafford, Vicksburg, " "
E. J. Kneibehler, Bad Axe, " "
Jacob Herriman, Freeland, " "
E. M. Lamos, Charlotte, " "
Chas. Liebum, Orleans, " "
Angus McCallum, Davis, " "
S. R. Miles, Buchanan, " "
Chas. Linton, Berlamont, " "

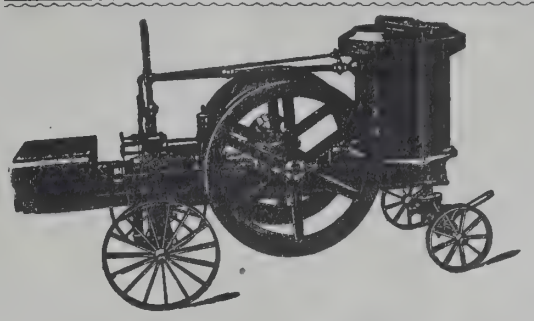


Judging from the numerous expressions of appreciation received from butter makers, the test was a success and will be continued next year. In many cases the improvement in the quality of the butter was a steady progression throughout the test, which would seem to indicate that the scores and criticisms had the desired effect. Thus, one cream-

The "Penny Wise and Pound Foolish"

Policy has an apt illustration in the man who buys a CHEAP gas or gasoline engine. Unreliable service, frequent and expensive repairs, wastefulness in fuel and short life offset many times over, the small saving in first cost. The "OTTO" is the original and BEST. Suppose it does cost a little more money, the extra dollars are well invested. 70000 users throughout the civilized world support us in this claim.

THE OTTO GAS ENGINE WORKS, Philadelphia, Pa.



Eagle 4 H. P. Stationary Engine

1904 MODEL

THIS ENGINE is of the four Cycle type and is especially designed and adapted for use on the farm—for separators, churning, pumping, elevating, hoisting, cutting ensilage, etc. No Expert or Engineer required to operate it—very simple in design and compact in construction. This engine is built so it can be easily moved from place to place. We can supply a special belt driven pumping jack to be used in connection with any pump having a wind mill head. RED

Red is the color of danger, whether on the semaphore or on the skin. When the face is reddened by eruptions, when boils break out on the body, or the angry red of sores and ulcers is displayed in the flesh, it is nature's danger signal. The blood is obstructed and tainted by impurities, and there can be no safety until the blood is made pure.

Dr. Pierce's Golden Medical Discovery purifies the blood, and removes the effete matter which clogs and corrupts it. It cures pimples, boils, eczema, scrofula, sores, ulcers and other consequences of impure blood.

"I feel greatly thankful for what your medicine has done for me," writes Mrs. Chas. Hood, of Kalkaska, Mich. "I suffered with scrofula of the head for twelve years. Tried every kind of medicine that I heard of but found no cure. Every one that looked at my head said they never saw anything like it. The last doctor I doctored with before applying to you I got worse every day. Was so miserable that I was unable to do any work at all. After taking two or three bottles of your 'Golden Medical Discovery' and using the local treatment you prescribed for me, I was cured and my head was entirely free from scrofula."

Accept no substitute for Doctor Pierce's Golden Medical Discovery. There is no other medicine which is "just as good" for diseases of the blood and the eruptions which are caused by the blood's impurity.

FREE. Dr. Pierce's Common Sense Medical Adviser is sent *free* on receipt of stamps to pay expense of mailing *only*. Send twenty-one one-cent stamps for the book in paper covers, or thirty-one stamps for the cloth-bound volume. Address Dr. R. V. Pierce, Buffalo, N. Y.

ery product progressed from 87 to 94.5; another from 89 to 96 and still another from 88 to 93, etc. One contestant writes: "Have adopted your suggestion as to acid test in cream ripening and find we have habitually ripened too much."

It may be of interest to note that the two highest scoring samples of butter in the creamery class were made, one with commercial starter, the other with natural. The amount of starter used varied from 8 per cent to 15 per cent. The cream in both cases was ripened at a temperature of 70° F. and churned with an acidity of from .50 per cent to .55 per cent.

The presentation of prizes will take place at the meeting of the Michigan Dairymen's Association in February. Plans for the 1904 test will also be presented at this meeting and we hope to see every butter maker present.

JOHN MICHELS, in charge of Test.
Agricultural College, Mich.

A Word with Prof. Farrington's "Losses at the Cheese Factory."

ED. HOARD'S DAIRYMAN:—We have very great respect for the words of Prof. Farrington, speaking *ex-cathedra* from a great agricultural University. The professor, who writes so smoothly and glibly, is not always a safe teacher, though he may be perfectly infallible in the school rooms at Madison, and we have no doubt that he is. Some of his writings are not, however, so. A case in point is his reply to H. E. Davis, DAIRYMAN Nov. 13th.

Now, those extremists of the Babcock milk test have hard work reconciling the patrons of the cheese factories where milk is taken on the straight fat basis, and this case of Mr. Davis is one of them. There is no use for Prof. Farrington to assert that the straight fat method of apportioning the dividends is correct, for the reason that it is unfair to the patron furnishing the poor milk. A pound of fat in three per cent milk will be worth much more for cheese making than a pound of fat in four per cent milk, and again the percentages of loss in the whey is much greater for rich milk, while the cheese made from 3.50 per cent milk will not bring a fraction of a cent more per lb., than cheese made from 4.50 per cent milk. For these vital reasons the straight fat method, viewed from every point of view, is unfair to the patron furnishing poor milk, and it is not to be wondered at, that it has not given satisfaction, and that many factories that have tried it for a year or so, have gone back to the pooling method. The straight fat method is ahead of the pooling, yet both are objectionable. The one favors the patron furnishing the poor milk, and the other favors the patron furnishing the rich milk. We are not, therefore, a bit surprised to see Mr. Davis kick. We see similar complaints periodically in all of the agricultural papers.

Prof. Farrington says that as a rule one pound of butter fat in milk is equivalent to about 2.6 pounds of cheese. This is but an average, and an average made from a mixture ranging in fat content from 3 per cent to 4.50 per cent. Eliminate the 3 per cent milk from the sum of the averages and a pound of fat will not make 2.6 pounds cheese. One pound of 1% milk fat will not make 2.6 lbs. cheese. It will scarcely make 2.5 lbs. While 1 lb. of 4.25% milk fat will make, under ordinary factory conditions, 2.45 lbs. cheese. One pound of fat in 5.20 milk will make about 2.33 lbs. of cheese, 2⅓ lbs. cheese, please remember, and yet the man furnishing this 5.20 milk will be paid double what the man, if such there are, who furnishes 2.60 milk.

Now, let us see about the poor milk. One pound of fat in milk testing 2.92 per cent fat, will make 2.94 pounds cheese. There is no doubt about this, as these figures have been arrived at after many tests, carried on for several years. Another example: 13,800 pounds milk, containing 2.87 per cent fat, made 1,207.75 pounds cheese, or 3.05 pounds cheese to one pound fat—3.05 pounds, please note, and not 2.60 as the Professor would have us believe all per cent of fat make. This 13,800 pounds milk of 2.87 fat content per cwt, contained a total of 396 lbs. fat, which made 1,207.75 pounds cheese.

Now, if this large quantity of milk, which was furnished by one patron, was paid on the straight fat system he would receive at 10 cents per pound, $106.41, while the actual sales value of the cheese amounted to $120.77. That is, this man's 13,800 pounds, 2.87 milk sold at the factory in cheese, for $120.77, while by the fat test he was paid but $106.41.

Had this 13,800 pounds of 2.87 milk been taken by weight, by pooling, the patron would receive $133.73, or $12.96 more than the cheese from his milk actually sold for, which also is bad, not at all so bad, as if he was paid by the straight fat method, when he would receive $14.36 less money than the cheese sold for. Here are two evils indeed, one only a little worse than the other, and yet, Prof. Farrington assures his correspondent that the fat test is "a fair and reasonable measure of the cheese value of milk."

The Professor further states that "100 lbs. of milk, which tests 3.0 per cent fat, will make about 7.8 lbs. cheese." In making such a statement the Professor largely presumes on the credulity of the readers of HOARD'S DAIRYMAN, who, if they have been readers of the paper long enough, ought to have known enough not to believe that. Why, we get that much cheese and more, from 100 lbs. of skim milk, certainly less than 2 per cent fat, in our work here every day.

Why, it would be a poor cheesemaker indeed, who would get less than 8.4 to 8½ lbs. cheese from 100 lbs. 3 per cent milk. We know of many trials, at dairy schools and dairy stations, that proves the assertion; 300 lbs. of 3 per cent milk at Ringwood (official figures) made 26½ lbs. cheese; 900 lbs. of the same kind of milk, at Guelph made 77.-26 lbs. cheese. The facts are that as the fat content of milk diminishes the more cheese will a pound of fat make, so that when we get down to 2 per cent fat, one lb. fat will make 3.50 lbs. cheese. One lb. fat of 3 per cent milk will very nearly make 3 lbs. cheese. While one lb. fat in rich milk testing 5.20 per cent fat, will make but 2.33 lbs. of cheese.

Now if buyers discriminated in the price paid, as cheese was made from a high or low fat content of the milk, there would be more fair play in paying by the fat method. But the skill of the cheesemaker counts for more than the richness of the milk, and one maker can make as good, perhaps better, cheese, from 3 per cent milk than another can with 5 per cent milk.

Another point of some importance, is the loss of the fat when the milk is rich, in the whey. In 3 per cent milk the loss is about 0.13, while with 5 per cent milk, the loss in the whey is never less than 0.3, but more frequently 0.5. How then shall milk be taken at the cheese factroy?

Answer—By the Babcock + 2 or better but more figuring, the fat test plus 2.5. Simple way to give fair play to all, is it it not? J. A.M.

P. E. I.

It must suffice, for the present at least, to say that HOARD'S DAIRYMAN does not agree with J. A. M.'s argument or conclusions.

CONCERNING OUR ADVERTISERS

Undoubtedly a good many of our readers have horses that are spavined, ringboned, or blemished in some manner and have never yet replied to the advertisement of Fleming Bros., which has appeared in this paper for a long time. This firm manufactures a line of veterinary remedies, spavin cures, fistula and poll evil cure, lump jaw cure, etc., guaranteeing every preparation to do the work it is intended to do. A sixty-four page illustrated booklet entitled "Stock Ailments that You Can Cure," will be mailed free to those who will write Fleming Bros., Chemists, Union Stock Yards, Chicago, Ill., mentioning this paper.

WHAT ONE CARRIAGE CONCERN DOES.—CARRIAGES DIRECT FROM FACTORY TO USERS AT WHOLESALE PRICES.

The Columbus Carriage and Harness Company is a large carriage and harness manufacturing concern that formerly sold its output through dealers, in the usual way. Later they adopted their present plan of selling direct from their factory to users.

Under this plan the man who wants a carriage can get it for a third less than he could of a dealer, because he saves all the dealer's profits. He can buy one carriage for the same price that a dealer who buys a hundred would have to pay.

Horse owners have been quick to see the great economies offered them under this plan, and in consequence the business of the Columbus Carriage and Harness Company has grown rapidly and has proved their plan a practical one.

Nothing could be fairer or straighter than the business methods of this house. They will send you upon request their large illustrated catalogue, giving exact reproductions and full descriptions of their vehicles and harness; you select what you want and send in your order If upon receipt of your purchase, you should be dissatisfied they will refund your money in full and pay the freight both ways, thus eliminating all risk from the transaction.

You can get the illustrated catalogue free by writing to The Columbus Carriage and Harness Company, Columbus, Ohio.

COOK THE FEED.

This is the season of the year when the average farmer is considering how to make the most out of the feed he has on hand. He may be studying and experimenting in a small way with stock foods, but he knows that for the main body of what sustains and fattens his animals he must look to the hay, grain and vegetables that he produces on the land. The problem being the best results with the minimum consumption of these products, the argument leads him directly

"ADVERTISEMENT."

PARALYSIS IN HOGS

BY this we refer more particularly to the loss of use of the hind quarters. The first symptoms are shown by slight stiffness, disinclination to move, the back may also be slightly arched and the hind legs will knuckle forward.

During the growth of young animals food rich in nitrogenous material must be supplied, such as bran, middlings, and oats, milk, beans and peas, as these go directly to the construction of bone, lean meat, tendons, hoofs, hair, etc. If such materials are not supplied and much fat forming food is allowed, such as corn, the weight of the animal becomes too great. The muscular structures are not sufficient to sustain it. The conducting power of the nerves is impaired, and from some slight exciting cause complete paraplegia, or paralysis of the hind quarters, will ensue.

When attacks come on give good surroundings and give a physic. For a pig castor oil in one or two-ounce doses; for older animals, one to two or even three ounces of Epsom salts dissolved in a half-pint of water should be given in gruel or as a drench at once.

This should be followed by the administration of iodide of pottassium in 10 to 15-grain doses three times a day. If this is not followed by improvements, nerve tonics should be employed, such as tincture of nux vomica in 10 to 30 drop doses, three times a day in gruel. Stimulating liniments or friction to the back is often valuable.

As after treatment or as a preventative—there is nothing else equal to Dr. Hess Stock Food, the great hog tonic—the great live stock reconstructive. It takes a hold of every vital organ; revives every function; gives a sharp appetite and strong digestion, which is followed by quick assimilation of the food eaten and very rapid growth in solid flesh. It keeps the animal free from disease by giving it the vitality necessary to resist and throw off the cause of disease.

Dr. Hess Stock Food is the scientific compound for horses, cattle, hogs and sheep, formulated by Dr. Hess (M. D., D. V. S.) Sold on a written guarantee, 100 lbs. for $5.00—except in Canada and on Pacific Slope—smaller quantities at a slight advance; fed in small dose. For any disease or condition for which Dr. Hess Stock Food is not recommended, the little yellow card in every package entitles you to a letter of advice and special prescription from Dr. Hess.

Dr. Hess has written a book on the diseases of stock and poultry. It is the only complete treatise for farmers and stockmen published.

Write and state what stock you have, and how many head of each; what stock food you have used; also mention this paper. Address Dr. Hess and Clark, Ashland, Ohio, and for this information you will receive this valuable book free, postage free.

AN UNEQUALED PROPOSITION

$5,000
Made by a Beaver Dam farmer in less than a month.

$1,800
Made by a Baraboo paper hanger in less than a week.

$1,200
Cleaned up by an Evansville man in one week.

If interested we can furnish names and addresses of these parties and many others who have done equally as well.
We can give a few parties who can secure $1,500 or give security to that amount a very paying business.
Choice locality. We have an article of value and interest to every farmer.
Full investigation invited. Best bank references. Write at once for particulars.

ILLUSTRATION.

The Bowsher Feed Mills (one size of which is shown with wagon box elevator in our illustration) are considered by thousands of users in all parts of the country as the most successful machine for the purpose; at least, we have just seen hundreds of letters from users all speaking to that effect. Many of our readers are among the number. The Bowsher mills are now entering their fifteenth season. No radical changes have been made, but the Bowsher Co. are always awake to improvements and it is possible that machines of this year's production are even a little better than those of last. The Bowsher Co. make a line of mills suitable for the requirements of all classes, from the farmer who has only a few head of stock, to the feeder who grinds 100,000 bushels in a single season. The Bowsher mills grind all kinds of grain, crush and grind ear corn, *with* or without *shuck*, and are capable of grinding grain in all kinds of conditions. This applies to both the belt power and sweep mills. The entire Bowsher line is claimed by the manufacturers to be different from all others in the market and in many respects heavier and stronger than others. Anyone purposing to invest in feed grinding machinery should secure circulars and carefully investigate the Bowsher line. The makers are the N. P. D. Bowsher Co., South Bend, Ind.

ILLUSTRATION

THE FARMER'S LANTERN.

We are showing herewith one of the ever popular Dietz lanterns. This is done, not so much to bespeak the virtues of this particular lantern, for Deitz makes many kinds and styles, but to call the attention of readers to the fact that Dietz lanterns in general are typical of all that is best. It is but natural that this concern should know all about the lantern business. It was established in New York City in 1840, and has consistently followed and confined its energies to this one branch of manufacture ever since. A good lantern is absolutely indispensable on the farm. A poor one is an intolerable nuisance. The good kind is as cheap and as easy to buy as the poor one. When you see a man that is satisfied with his lantern, if he uses it daily because there's no worry about it, easily lighted, extinguished, cleaned and filled, and if it burns steadily without flickering and sheds a strong, clear, white light, the chances are his lantern is a Dietz. The name of Dietz appears plainly on all his lanterns, so there's no chance for deception when one goes to buy. A Dietz lantern book will be mailed free to any one writing for it. See advertisement in another column for correct address.

Oils Cure Cancer.

All forms of cancer and tumor, internal and external, cured by soothing, balmy oil, and without pain or disfigurement. No experiment, but successfully used ten years. Write to the Home Office of the Originator for free book—Dr. D. M. Bye Co., Drawer 505, Indianopolis, Ind.

back to the reasonable and now generally adopted practice of cooking the food. It is no longer a matter of experiment. It has passed into general practice. There is no escaping the conclusion that cooking the food is the most economical method of feeding, and produces noticeably, even in a short period, better condition and more satisfactory results with all domestic animals. Rather than expediency of cooking, therefore, the problem is one of means. This question any practical feeder of stock upon investigation will find most satisfactorily solved by the Electric Feed Cookers, made by the Electric Wheel Co., of Quincy, Ill. They are advertised elsewhere. They may be had in sizes from 25 to 100 gallons. They combine the valuable requisites of strength, durability, easy and quick heating and with little fuel consumption. All are arranged so that either coal or wood may be used. The most reasonable prices at which each of the several sizes is sold, brings them within the reach of every feeder, and really leaves no valid excuse to any one for not adopting the cooking practice. Readers interested should consult the advertisement and write the company for their descriptive matter and full information.

VETERINARY.

Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

Abortion.

I fear my herd of cows have infectious abortion, as two have lost their calves lately. I have had afterbirth removed, and am injecting daily a solution of carbolic acid. I see by the DAIRYMAN that you recommend powdered cramp bark. Where can I get it? Local druggists do not know of it? Would it be beneficial to inject the 2 per cent carbolic acid solution into the cows who have not as yet aborted? F. S.
Peshtigo, Wis.

ANSWER.

Cramp bark is technically known as *Viburnum Opulus*. Every druggist knows what it is, and can get it for you, if he does not keep it in stock. Its physiological actions are, tonic, astringent, antispasmodic, nerve sedative, and anti-abortive. It is a sedative and tonic to the uterine and ovarian nerve centers, hence it is especially indicated in these cases. You will notice it is not intended to kill germs but to aid the system in resisting their attacks. You can do no harm by injectnig as you propose, but a 2 per cent solution of carbolic acid is too strong; a ½ to 1 per cent is strong enough.

Tape Worm in Calves.

What can you tell me about the treatment of tape worm (Facnia) in calves? F. H. S.
Fairbanks, Tex.

ANSWER.

To expel these worms you must compel the animal to fast for at least 24 hours as the medicine must be given on an absolutely empty stomach. Then you may give a calf 3 months old ½ ounce of Areca nut (powdered) and follow this dose with a pint of raw linseed oil in from 4 to 5 hours. This usually makes them come but every segment of the worm which is expelled must be destroyed by fire as it is liable to become epidemic in your herd. Remove all healthy calves from the pasture where such segments have been dropped to prevent further infection.

Ringworms.

I had some cattle away from home on pasture last summer, and now some of them have some kind of skin disease. It begins around one eye and spreads over the body, here and there in round spots. The hair comes off first and then it looks white and scaly. The spots are quite small at first, but get larger. Cattle are all hearty and in good order. I washed the first one with a 1-1000 solution of bi-chloride of mercury for a while, and now am using carbolic acid in vaseline. I succeeded in curing some places, but it breaks out in other spots, and the number of diseased animals is steadily increasing. G. P.
Hiram, O.

ANSWER.

Your cattle are troubled with ringworms. These can easily be destroyed by applying either zenoleum or chloronaptholeum, full strength, to the parts affected. Apply with a brush, or if you are afraid you will get it into the eyes, rub it in with your fingers. This may be repeated in a week.

To Cure a Hard Milker.

Have a heifer that gives about 3 gallons of milk per day, but she milks hard. At first thought calf might starve but she milks some easier now. Never used or saw a bistoury or dilator. Would you advise use of one on her?
Martin, Tenn. R. C. B.

ANSWER.

The bistoury is the only reliable remedy. Make your incision in the four opposite directions, so that the openings at the bottom of the teat will represent the letter X. At first she will lose some of the milk which will drop away for 6 to 8 hours, but the swelling will close the excessive opening and the natural flow while milking will govern the closure so as to leave a normal opening which will be larger than formerly, and the cow will milk much easier in the future. The bistoury can be obtained from this office for $1.50.

Inflamed Quarter.

I have a cow whose right hind quarter of the udder has become perfectly hard. It began to get hard six weeks ago and gradually kept getting harder till it has become as hard as a rock, and she has shrunk fully 50% in her milk.
Escondido, Cal. M. M. B.

ANSWER.

Rub the quarter twice daily with the following ointment: Lanolin, 12 ozs.; Iodine resublimed, 2 ozs., and apply with plenty of hand rubbing.

Proud Flesh.

I have a cow that cut herself by kicking against the corner of a shovel. The wound was bruised, and proud flesh, a large mass, is in the cut now. I have used blue vitriol to eat it out, but it does not work very fast. The cut is on the cords just between the gambrel joint and her foot. C. L. L.
Dorset, Vt.

ANSWER.

Wash the parts clean once daily with soap and warm water. When dry apply calomel over the entire cut; dust it on with a little cotton batting and give it a good covering with same.

Parasites, Perhaps.

I have a three-year-old Holstein heifer that has spells of being sick. She had the first one last April and has had them at times ever since. Sometimes she will go two or three months and again she will have them once every week or two.

Her ears droop and she holds her head out straight, and her eyes roll back into her head, then before long she lays down and lays her head around on her side. She does not seem to bloat much, but seems to be in some pain. She generally has a chill, sometimes quite hard. Her bowels are always in good condition. W. A. B.
Dorr, Mich.

ANSWER.

Your trouble may be due to intestinal parasites, but we can not tell positively without a personal examination. If you have a qualified veterinarian within your reach it would be well to have him make an examination.

Chorea.

I have a colt two years old that has got springhalt hitch in both hind legs on first starting out, but after traveling a few steps you don't notice it much. He is somewhat overgrown as I think he will weigh fully 1,600 pounds. P. E. W.
Mt. Vernon, Wash.

ANSWER.

Your colt has chorea, which is characteristic of fast growing colts. There is no cure for this trouble. As a rule they grow worse as they grow older.

Fail to Come in Heat.

I have pure bred Durhams that freshened in fall. I let calves suck them and they fail to come in heat, which leaves too long space between calves. What shall I do?

I also have very fine ⅞ Jersey cow 4 years old, freshened in September. Right front quarter of bag has been hard and caked several times, caused, I think, from fighting with another cow.
Bankers, Mich. B. E. K.

ANSWER.

Wean your calves and increase your grain ration. You may give a teaspoonful of nux vomica ¼ (powdered) in food twice daily.

See Inflamed Quarter, this issue.

KENDALL'S SPAVIN CURE
TRADE MARK.
When you see the above trade mark on a label you are sure that you are getting the genuine
KENDALL'S SPAVIN CURE.
That means that you are getting the only absolutely time tested and reliable remedy for Spavin, Ring Bone, Curb, Splint and all forms of lameness in horses. A single bottle may save your horse. It has worked that way in thousands of cases. Note this man's experience:
Wausau, Neb., March 13, 1902, P. O. Box 347.
Dr. B. J. Kendall Co., Enosburg Falls, Vt.
Gentlemen:—You may remember I sent for your book, "A Treatise on the Horse and His Diseases," about a year ago. At that time I was using your Kendall's Spavin Cure on a *Bone Spavin* of about eighteen months standing. **I used two and one-half bottles and now there is no spavin,** not even a bunch. You may use my name among your testimonials if you wish.
Yours truly, D. E. SEGER.
For sale by all druggists. Price, $1; six for $5. As a liniment for family use it has no equal. Ask your druggist for Kendall's Spavin Cure, also "A Treatise on the Horse," the book free for the asking, or address
Dr. B. J. Kendall Company,
Enosburg Falls, Vermont.

"SAVE-THE-HORSE"
Registered Trade Mark
SPAVIN CURE
BEGIN TREATMENT AT ONCE!
HAVE A PERMANENTLY SOUND HORSE FOR SPRING.
Cured horses are absolute certainties as to the possibility of the remedy for your own case. Such results as shown in our booklet, by business men whose reliability can be readily ascertained, have carried "SAVE-THE-HORSE" over skepticism, prejudice and uncertainty. Send for booklet and copy of written guarantee, which is as binding to protect you as the best legal talent could make it. No man need see his horse suffer and become incapacitated.
"SAVE-THE-HORSE" Positively and Permanently Cures BONE and BOG SPAVIN, THOROUGH-PIN, RINGBONE (except low ringbone,) CURB, SPLINT, CAPPED HOCK, WINDPUFF, SHOE BOIL, WEAK and SPRAINED TENDONS and all LAMENESS. Cures without scar, blemish or loss of hair. Horse may work as usual.
$5.00 per bottle. Written guarantee with every bottle. Need of second bottle improbable, except in rarest cases. If your case is different we advise frankly as to possibility of the remedy effecting a cure. Give veterinarian's diagnosis, if he is competent. Describe age, development, location of swellings, lameness, and way horse carries and holds leg.
$5.00 per bottle at all druggists and dealers, or sent express prepaid.
TROY CHEMICAL CO., Troy, N. Y.
Also manufacturers of Veterinary Pixine.

HOOD FARM
Abortion Treatment
Hood Farm Abortion Cure is proving the most successful remedy for this very prevalent trouble that we have yet seen.
After Abortion cows should be injected with Hood Farm Antiseptic Breeding Powder, which thoroughly disinfects, kills all germs and **makes cows breed.** Also successful where cows fail to clean and where they do not come in season regularly.
Hood Farm Abortion Cure, dollar size, prepaid to any railroad express point in the U. S., $1.25; $2.50 size, containing four times this quantity, $2.75.
Dollar size Breeding Powder, by mail $1.15; $2.50 size prepaid for $2.75.
Hood Farm Flexible Injection Tube, for administering the Powder, 75 cents; by mail, 90 cents. Address
C. I. HOOD CO., Lowell, Mass.

Supreme Court Now Considering Oleo Cases.

Hearings Were Granted Oleo People Last Wedn sday Before the Full Bench.

The fate of the national oleomargarine law now rests with the Supreme Court of the United States.

Both the oleomargarine makers and the government had an oral hearing before this court last Wednesday afternoon. Attorneys Guthrie, of New York, and Outcalt, of Cincinnati, spoke for the oleomargarine interests, while the government was represented by Solicitor General Hoyt of the Department of Justice.

The hearing lasted four hours, and was marked by extraordinary interest upon the part of the court, counsel for both sides being sharply questioned by various members of the court, Justices Harlan, Peckham, White, Holmes and Brown displaying particular interest.

In the hearing the oleomargarine makers claimed that colored oleomargarine could not be sold as a substitute for butter; Mr. Dadie, representing Moxley & Co., of Chicago, was shown to have testified in court that the uncolored goods were being very largely used to replace lard.

In his closing arguments, Attorney Outcalt, representing the oleo makers, stated that the manufacturers were simply awaiting the determination of the cases before the court to decide whether or not they should close business.

Official Records of Holstein-Friesian Cows, From Oct. 30 to Nov. 12, 1903.

During this period the records of forty-one cows have been received. Nine full-aged cows averaged, age 7 years, 3 months, 16 days, days from calving 14; Milk 434 lbs.; butter fat 15.588 lbs., equivalent butter 18 lbs,, 3 oz., per cent of fat shown in the milk 3.61. Eight four-year-olds averaged, age 4 years, 5 months, 9 days, days from calving 23; Milk 395.1 lbs,, butter fat 13.067 lbs., equivalent butter 15 lbs., 3.5 oz., per cent of fat showu in milk 3.34. Fiiteen three-year-olds averaged, age 3 years, 3 months, 19 days, days from calving 13; Milk 336.4 lbs., butter fat 11,399 lbs., equivalent butter, 13 lbs., 4.8 oz. per cent of fat shown in the milk 3.34. Nine two-year-olds averaged, age 2 years, 3 months, 9 days, days from calving 31; Milk 279.6 lbs., butter fat 9.221 lbs., equivalent butter 10 lbs., 12.1 oz. per cent of fat shown in milk 3.34.

It must be borne in mind that these records are made under the careful supervision of agricultural experiment stations and that 85.7 per cent of fat found in the milk is equivalent to 1a pound of butter. In detail the records wers as follows:

Chloe Mechthilde 49535—5 years, 1 month, 8 days, days from calving 9: Milk 479.3 lbs., butter fat 18.895 lbs., equivalent butter 22 lbs., 0.7 oz. Owner John B. Irwin, Minneapolis, Minn.

Edith Prescott DeKol 44886—6 years, 4 months, 19 days, days from calving 16; Milk 467,6 lbs., butter fat 18,046 lbs., equivalent butter 21 lbs. 0.9 oz. Fourteen-day record: days from calving 10: Milk 899.3 lbs,, butter fat 34.944 lbs., equivalent butter 39 lbs, 6.1 oz. Owner Henry Stevens & Son, Lacona, N. Y.

Aaggie Clothilde Bawn 2d. 43421—6 years, 4 months, 26 days, days from calving 13: Milk 531.4 lbs., butter fat 16.949 lbs., equivalent butter 19 lbs., 12.4 oz.

Agnes DeKol's Queen DeKol 41232—10 years, 6 months, 6 days, days from calving 22: Milk 421.4 lbs. butter fat 16.571 lbs., equivalent butter 19 lbs., 5.3 oz.

Western Duchess 40069—8 years, 5 months, 18 days, days from calving 6: Milk 372.8 lbs., butter fat 15,970 lbs., equivalent butter 18 lbs., 10.1 oz.

Magali 2d 60 W.,—10 years, 8 months, 2 days, days from calving, 7: Milk 442.1 lbs., butter fat 14.565 lbs., equivalent butter, 6 lbs,, 15.9 oz. Owner, John B. Irwin, Minneapolis, Minn.

Queen Alma Marie 49532—5 years, 6 days, days from calving, 27; Milk 450.6 lbs,, butter fat 13.276 lbs., equivalent butter, 15 lbs., 7.8 oz. Owner, John B. Irwin, Minneapolis, Minn.

Lady Kurt Alpha 42193—7 years, 5 months, 21 days, days from calving, 7: Milk 393.5 lbs., butter fat 13.094 lbs., equivalent butter, 15 lbs., 4.4 oz.

DeKol Echo Molly 47140—5 years, 6 months, 19 days, days from calving, 16: Milk 347 lbs., butter fat 12.922 lbs., equivalent butter, 15 lbs., 1.2 oz. Owner, T. A. Mitchell, Weedsport, N. Y.

Lady Bettina Herbert 50553—4 years, 8 months, 29 days, days from calving, 25: Milk 845.3 lbs., butter fat 15.719 lbs., equivalent butter, 18 lbs., 5.4 oz. Owner, T. S. Tompkins, White Bear Lake, Minn.

Nellie Pietertje Hartog 49313-4 years, 7 months, 5 days, days from calving, 20: Milk 521.7 lbs., butter fat 14.958 lbs., equivalent butter, 17 lbs., 7.2 oz.

Kitty Gale DeKol 52870—4 years, 2 months, 7 days, days from calving, 15: Milk 390.3 lbs., butter fat 13.332 lbs., equivalent butter, 15 lbs., 8.9 oz.

Western Princess 49649—4 years, 5 months, 1 day, days from calving, 12: Milk 368 lbs., butter fat 13.090 lbs., equivalent butter, 15 lbs., 4.4 oz.

Princess DeKol Artis 49947—4 years, 7 months, 9 days' days from calving, 17: Milk 352.3 lbs., butter fat 12.335 lbs., equivalent butter 14 lbs., 6.3 oz. Owner, T. A. Mitchell, Weedsport, N. Y.

Miranda Arcturus 50970—4 years, 1 month, 5 days, days from calving, 20: Milk 389 lbs., butter fat 11.750 lbs., equivalent butter 13 lbs., 11.3 oz.

Jessie Griepe 2d 50668—4 years, 4 months, 24 days, days from calving, 33: Milk 326.8 lbs., butter fat 11.610 lbs., equivalent butter, 13 lbs., 8.7 oz.

Violet Netherland DeKol 48353 — 4 years, 5 months, 19 days, days from calving, 39: Milk 327.6 lbs., butter fat 11.544 lbs., equivalent butter 13 lbs., 7.5 oz.

Aaltje Salo Erna 53933—3 years, 6 months, 19 days, days from calving, 20: Milk 434.1 lbs., butter fat 14.032 lbs., equivalent butter, 16 lbs., 5.9 oz. Owner, T. S. Tompkins, White Bear Lake, Minn.

Kaan Marie Mechthilde 53732—3 years, 10 months. 1 day, days after calving 49: Milk 403.6 lbs., butter fat 13.989 lbs., equivalent butter 16 lbs., 5.1 oz. Thirty day record: days from calving 35: Milk 1.702.3 lbs., butter fat 54.826 lbs., equivalent butter 63 lbs., 15.4 oz. Owner, John B. Irwin, Minneapolis, Minn.

Sierra Blanco 52257—3 years, 8 months, 10 days, days from calving 8: Milk 382.7 lbs., butter fat 13.390 lbs., equivalent butter 15 lbs., 10 oz.

Pantomime Blanco 55199—3 years, 3 months, 10 days, days from calving 11: Milk 442.6 lbs., butter fat 12.866 lbs., equivalent butter 15 lbs., 0.2 oz.

Heilo Aaggie Johanna 3d. 55020—3 years, 2 months, 13 days, days from calving 6: Milk 318.5 lbs., butter fat 12.192 lbs., equivalent butter 14 lbs., 3.6 oz.

Pontiac Hesseltje Hengerveld 53432—3 years, 5 months, 13 days, days from calvivg 6: Milk 321 lbs., butter fat 11.730 lbs., equivalent butter 13 lbs., 11 oz.

Wisconsin Bess 3d. 55018—3 years, 3 months, 10 days, days from calving 7; Milk 303.1 lbs., butter fat 11.717 lbs., equivalent butter 13 lbs., 10.7 oz.

Manor Josie Jane 54502—3 years, 1 month, 6 days, days from calving 7: Milk 347 lbs. butter fat 11.416 lbs., equivalent butter 13 lbs., 5.1 oz.

Jewel Colantha Mercedes 56650—3 years, 1 month, 25 days, days from calving 10: Milk 293 lbs., butter fat 10.530 lbs., equivalent butter 12 lbs., 4.6 oz. Owner, T. S. Tompkins, White Bear Lake, Minn.

Mabel Haskins Mechthilde 55876—3 years, 29 days, days from calving 11: Milk 381.5 lbs., butter fat 10.359 lbs., equivalent butter 12 lbs., 1.4 oz.

Helena Burke Butter Cup 54491—3 years, 1 month. 23 days, days from calving 9: Milk 309.9 lbs., butter fat 10.302 lbs., equivalent butter 12 lbs., 0.3 oz.

Pontiac Erato 53448—3 years, 25 days, days from calving 8: Milk 255 lbs., butter fat 9.571 lbs., equivalent butter 11 lbs., 2.7 oz.

Pontiac Euterpe 53442—3 years, 2 months, 24 days, days from calving 9: Milk 268 lbs., butter fat 9.986 lbs., equivalent butter 11 lbs., 10.4 oz.

Korndyke Artis Duchess 56393—3 years, 3 months, 12 days, days after calving, 9: Milk 338.5 lbs., butter fat 9.328 lbs., equivalent butter 10 lbs., 14.1 oz. Owner T. A. Mitchell, Weedsport, N. Y.

Pontiac Pauline Hengerveld 53444—3 years, 1 month, 28 days, days from calving, 22: Milk 248 lbs., butter fat 9.573 lbs., equivalent butter, 11 lbs., 2.7 oz.

Pauline Paul Georgie 2d 56544—2 years, 4 months, 21 days, days from calving 15: Milk 324.7 lbs., butter fat 11.734 lbs., equivalent butter, 13 lbs., 11 oz. Fourteen day record: days from calving 9: Milk 616.4 lbs., butter fat 23.064 lbs., equivalent butter 26 lbs., 14.5 oz. Owner Henry Stevens & Son, Lacona, N. Y.

Terra Alba DeKol 55201—2 years, 10 months, 14 days, days from calving 15: Milk, 274 lbs., butter fat 10.964 lbs., equivalent butter 12 lbs., 12.7 oz.

Wilhelma Butter Girl 65048—2 years, 6 months, 14 days, days from calving 18: Milk 336.7 lbs., butter fat 10.518 lbs., equivalent butter 12 lbs., 4.3 oz. Fourteen-day record, days from calving, 13: Milk 662.2 lbs., butter fat 20.547 lbs., equivalent butter 23 lbs., 15.6 oz. Owner Henry Stevens & Son, Lacona, N. Y.

Aaltje Salo Freda 61564—2 years, 5 days, days from calving 11: Milk 278.5 lbs., butter fat 9.828 lbs., equivalent butter 11 lbs., 7.5 oz. Owner T. S. Tompkins, White Bear Lake, Minn.

Gerben DeKol Mercedes 61091—2 years,16 days, days from calving 26: Milk 255.7 lbs., butter fat 8.476 lbs., equivalent butter, 9 lbs., 14.2 oz. Owner T. S. Tompkins, White Bear Lake, Minn,

Lillian Walker 2d 57094—2 years, 4 months, 17 days, days from calving, 19: Milk 334.4 lbs., butter fat 8.187 lbs., equivalent butter, 9 lbs., 8.8 oz.

Kaan Marie Jewel 61132—1 year, 10 months, 23 days, days from calving, 34: Milk 252.6 lbs., butter fat 8.077 lbs., equivalent butter, 9 lbs., 6.8 oz. Owner John B. Irwin, Minneapolis, Minn.

Snowball Pink 59077—2 years,4 months, 8 days, days from calving 96: Milk 197.2 lbs., butter fat 7.941 lbs., equivalent butter 9 lbs., 4.2 oz.

Mercedes Jewel DeKol 61095—1 year,11 months, 22 days, days from calving 42: Milk 262.4 lbs., butter fat 7.261 lbs., equivalent butter, 8 lbs., 7.5 oz. Owner T. S. Thompkins, White Bear Lake, Minn.

Tanning a Cow Hide.

Would you kindly tell me how to tan a cow hide for a robe, leaving the hair on? O. B.
Dickinson, N. D.

This is a process on which we have no personal knowledge and accordingly submit it to those of our subscribers who may have had experience.

The Inside of a Hog

determines the value of the outside. First of all, he must have good health—freedom from worms, cholera, swine plague, etc. All these things and success are possible if he is properly fed.

PRUSSIAN STOCK FOOD

has made a most enviable reputation with hog feeders everywhere. It conditions the stomach and bowels, promotes the appetite, improves digestion and leads to perfect assimilation of the food. These mean saving in feed, quick fattening and large profit.

"Gentlemen:—I have been using your Prussian Stock Food for six months and find it one of the best remedies I have ever used. My neighbor's hogs all died with the cholera last fall. I fattened over 100 head and did not have a sick hog.—Abraham Whisler, Chill, Ind." Prussian Stock Food is guaranteed to give satisfaction when used according to directions. If no dealer at your place write us. Tell us how many head of stock you have and where you saw this ad and we will send you our 68 page Farmer's and Stockman's Hand Book Free.

PRUSSIAN REMEDY CO., ST., PAUL MINN.

Buy You a Ticket to CROOKSTON, MINN., and call upon

The Polk County Land & Loan Company

For Choice Red River Valley Farms. They pay railroad expenses if you buy from them. A few good bargains.

360 acre farm, 4½ miles from Crookston, Minn., a city of 7,000 inhabitants, and 2½ miles from the State Experimental Farm. This is a photograph of the buildings as they are today: House is 16x24 1½ stories with an L 14x22, and a wood shed in connection 20 feet square, all on a brick foundation. Barn 28x48, with a lean to 16x48, sheeted both inside and out. Two granaries, one 14x80, and the other 14x42. The buildings are all well painted and in very good repair, and has a fine artesian well. Every acre of this farm is under a high state of cultivation, and is well drained by a slight ravine running through the farm merely sufficient for self drainage. The soil is a rich, deep black loam with a clay sub-soil, and in every respect is considered to be one of the best farms in that vicinity. Our price on this farm is $35.00 per acre.

This is a **320** acre farm about 2½ miles south of the city, this farm is quite well improved, has a very good house of about seven rooms, 1½ stories, barn large enough for ten head of horses, also a good granary, pasture and an artesian well, also has a good well at the house, good grove around the building, This is a very choice piece of land for the price $32.50.

160 acres north-east of the city; this is all hay land, and located in a German settlement, the surrounding country is nearly all under cultivation; we consider this a good piece of land for an investment, this could all be put under the plow, if desired. Price $19.00 per acre.

Wise Words on Swine Husbandry.

In the Wisconsin Farmers' Institute Bulletin No. 10 of 1896, will be found one of the splendid talks of that wonderfully wise old man, Theodore Louis, on Swine Husbandry. There is so much wisdom in it that we wish we had room for the whole address but we must be content with the following extracts:

We must learn to become breeders. I do not mean that we can be elevated all at once to the standard of a scientific breeder, but I believe that it is the mission of every farmer, and especially of the younger men, that they should understand the principles of breeding in order that the animal that we have upon our hands shall be of benefit to our herd.

We say we have an animal of early maturity today. Very true, we have; we have improved the hog immensely; we have increased its digestive capacity. The intestines of the old type of hog were only nine times the length of his body. Man has increased that to twenty-two times the length of his body. We have an animal of early maturity—we have an animal that can consume more food. Let us not forget at the same time that we have an animal that eats the greatest amount of food in the shortest given time, and gives the greatest returns, digesting it more quickly.

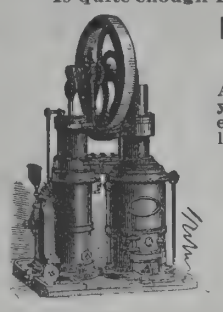
Market Them Young.

What does early maturity mean? As generally accepted it means that we dare breed the animal at an early age, but what is early maturity? Early maturity means that we have created an animal that we can put upon the market at an early age. Ten years ago when I spoke in this city at a Farmers' Institute, three-quarters of the farmers of the state wintered their animals, and it was the eighteen or nineteen months old hog that was put upon the market. I said then, "Why, it takes so much more food to feed an animal up to that age, it don't pay." And I was often ridiculed. I labored hard to bring the subject before the farmers of the state of Wisconsin. Our Experiment Station came to my assistance in later years, and we have demonstrated to the farmers that when we raise a hog that weighs 400 pounds, that it takes at least eight pounds for the food of support, while it takes only two and a half pounds for food of support for a 100-pound animal, and it only takes four and a half pounds of food to make one pound of gain on the animal that we have before us. It seemed to be a new thought, a new idea, at the time that I made that assertion. The intelligent farmer who has attended the institute and kept pace with the improvements, knows now that this is true. I met an old acquaintance this morning in the street, and I said: "Are you coming to the institute?" He said: "No, sir, there is no need for me or my boys to come. You men are well paid for talking, and you are simply book-farmers and I can't learn from you." Oh, it is a pity that we know so much, and know it all, and have nothing to forget.

Grow Proper Feeds.

But this is not alone what you are doing, many of you. You are not only feeding corn to shoats, but you are carrying hogs, keeping them over and you are feeding that same corn to your brood sows at the same time. First we ruin the mother, then we ruin the growing pig by feeding him on corn, and corn alone. He is not growing. He is simply accumulating fat, and is making a slow growth. It is not the weak bone that you complain of, that you got from your breeder, from the stock you have paid money for—no, it is your own ignorance of the principles of feeding. You are ruining the young animal on food that is not making muscle, bone or strength. There is one principle of feeding. The other principle of feeding is to ask ourselves what shall we grow when we intend to raise hogs upon the farm? I know that here in the state of Wisconsin I do not meet with the difficulty that I met in the states west, because you have clover upon your farms—you can grow clover to advantage, while to the Western man upon those big prairies and plains, it is yet a great question how to grow clover. Then let us that are in a position to do so, grow feeds that we need, in order to feed the breeding animal, and at the same time grow the growing pig before we fatten and finish him for the market. If young brood sows and sires would receive more attention during the time of their development by being fed on foods and feeding material calculated in its nature to build up their frames and constitutional vigor, we would have less to complain of in the line of heriditary ailments, loss of prolificness, size and inability at the time of parturition. We are the architects, and nature furnishes an abundance of material from which to build successfully.

Mistakes That Are Made.



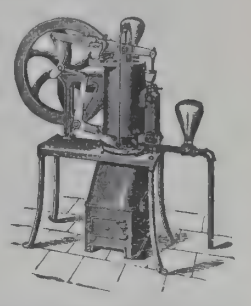
The principle of early maturity was what I might really call the salvation of the swine breeder. He often grumbled that the market demanded an animal of only 200 or 250 lbs., and did not know that that was his advantage, that the hog is an animal that must grow from the time it is born till it goes to the block, and it can be made a very profitable animal. I have had 60 and 70 hogs that I carried through the winter, and my corn cribs were full in Dec. and my hogs weighed 100 lbs. apiece. The next year I wanted to put them on the market because I wanted to run them upon the clover field, so as to have a heavy hog on the market. We were selling our hogs in those days upon the lumberman's market. What was the result? I fed these hogs, I gave them about three lbs of grain each day, which was simply the food of support, and they weighed 100 lbs in March just as they did in December, and my corn cribs were empty. There are lots of men doing the same thing to-day. Now, then, while I have stated that early maturity is our advantage so far as feeding and selling of the animal is concerned, we are many of us making another mistake—we are breeding the animals too early. I often receive letters asking me what ails the pigs. I cannot enumerate all the different ailments and all the besetments and trouble that I am told about in these letters. We must be careful not to breed from immature animals. I will venture to say, and it is quite a venture, that nine-tenths of the swine breeders in this audience are breeding from immature animals. That is a venture, for me, because I am not acquainted any more with the agriculture of my state, but I believe that the improvement in this respect has been as slow in Wisconsin as it is in any other state. Let us remember that while an animal is mature as an improved animal at 12 months of age, it is not in any sense a mature animal for breeding purposes. The parent stock should first perfect itself in growth and maturity, in constitution and vigor, before we can expect perfect offspring. The man who each year sacrifices the old sow from his farm, that has been a good mother and a good milker, and has given him a good profit, sacrifices one of the best pieces of property away from his farm. The sow must stand in the place of the cow. I know I am talking to dairymen in this section of the country. I know you are depending upon your by-products. You must save yourselves from immature stock and stock that is liable to disease, and that will not give you the same result for the food consumed as if the stock had been bred from a larger and more perfect mother. On my place the sow must stand in the place of the cow, and do you know that the sow will give as much milk as your average dairy cow during the twenty-four hours? Don't ask me if I ever milked one. I believe that every young man should have a pair of scales upon his farm. A thousand-pound Chicago scale costs only $12.00. I gave a pair to my son, and I believe that nothing ever went upon the farm that paid itself better. It is only when we pass an animal over the scales and see what we are gaining in our feeding that we become intelligent feeders.

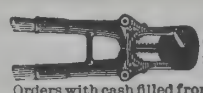
Select Good Breeders.

If you take a litter of pigs the morning after they are born, and put them in a basket and on the scales, you will find they weigh all the way from sixteen to eighteen pounds, according to the age and size of the mother; then if you weigh them the next morning and every twenty-four hours in succession, you will find that they have made a live weight gain of all the way from two pounds, three, three and a half, four, and as high as five lbs., and in order to gain this weight the sow must have given at the least consideration twenty-five or thirty pounds of milk during the twenty-four hours. That is the way I have milked her. It takes eleven pounds of milk to make one pound of live weight in a fifty-pound pig, and so I can easily calculate. I don't know how many litters of pigs I have weighed on my place. Now, then, gentleman, if you have a mother that is a good milker, a good mother of a kind disposition, and of good bearing, keep her on the farm, and do not discard her and breed from immature hogs at the age of 8 or 9

HALF ENOUGH WATER

Is quite enough for some people, but most people want water every day. If





RIDER or ERICSSON HOT AIR PUMPS

WINCHESTER

RIFLE & PISTOL CARTRIDGES.

"It's the shots that hit that count." Winchester Rifle and Pistol Cartridges in all calibers hit, that is, they shoot accurately and strike a good, hard, penetrating blow. This is the kind of cartridges you will get, if you insist on having the time-tried Winchester make.

ALL DEALERS SELL WINCHESTER MAKE OF CARTRIDGES.

months; that is to say, they should not farrow until 12 months old.

You complain of your swine breeders; when your stock goes down, you say they grow too fine a bone, they grow too small in size, and you say your litters are not enough in number. Do not charge the breeders with the imperfections of your stock. You ought not to, but blame yourself—your ignorance in not knowing how to breed or make a selection.

Selection is the first point in breeding, and I say every young man should become an intelligent selector, and should learn when he has a good mother to keep her on his place as long as she remains a good mother, and treat her with the kindest regard. All such animals are representative of motherhood, and should be treated with the utmost kindness.

FEED AND SHELTER.

Now, then, in regard to feeding and shelter. We have heard today of barn building. We have heard of house building. We have had most all the steps of agriculture before us, but where does your hog sleep, if you please? Who of you men have a hog house? Not very long ago a man whom I respected highly said to me: "Mr. Louis, a hog house is a nuisance, it breeds disease." He is a dairyman, and I asked him if his cow barn and his horse barn bred disease among his cows and horses. He said: "No, of course not. We clean them out." "Well, then," said I, "why don't you clean out your hog house?" On what do the hogs depend for shelter on the majority of farms? On the straw pile; that is where it is. I have no doubt that some of the men who are here today at this institute let their hogs sleep in the straw pile, and they told their wives this morning that they were going to feed the hogs before they left, and then forgot to do it. That is always the last chore on the farm, because the farmer thinks it is of no importance. If he didn't forget it, he went out, took a bushel of corn, and called the hogs, throwing it, regardless of any condition the ground may offer for a feeding place; that was the first step toward profitable or unprofitable feeding. He did not notice that the hogs were standing there trembling, and that they had slept in a condition where they had become heated, being piled on top of each other, and when they came out in the morning they began coughing. This man goes to his neighbor and says: "Do you know what is good for hogs that cough?" Yes, I know; hogs have worms when they cough. Give them some turpentine." Or he will write me a letter, and will say: "Mr. Louis, my hogs are breaking down in the loins; they have paralysis; they are dragging their hind legs behind them; they can't walk or stand up. My neighbors say they have kidney worms." No, they haven't anything of the kind, but they have slept in a position where they could not help but take cold, or else they are overfed, and paralysis of the loins had taken place. Then, again, when this man threw down the corn, did he notice to see that it was masticated, or that it was digested? Has he ever looked into the excrement of his animals? The intelligent feeder knows about these things. One December day my son was feeding thirty or forty shoats; he is an intelligent feeder and I said to him: "My dear sir, is it not time that you commenced to grind your corn?" He said: "Why?" Said I: "The excrement of these animals shows that they are not digesting and assimilating their food as they should." Said he: "Father, corn is cheap. We in the West here raised an immense crop." I will tell you what I told him then. I told him to come "Joseph" on that corn, for we didn't know what the next year would bring forth. I think we must come "Joseph" on our feed at all times and obtain the best possible results for grain consumed, be it cheap or dear.

A Connecticut Ration—Brewers Grains.

Will you please formulate a feed ration for me, for milch cows weighing 1,000 lbs. or more, consisting of dried brewers grains, good ensilage and mixed hay. For grain, can use bran, cotton seed, or corn meal. Being somewhat short of hay and ensilage, I have purchased a car of the dried brewers grains to help out, and wishing to make the brewers grains the "basis" of my ration, will you, in formulating a ration, include as much of the brewers grains as will be possible, and still be in the bounds of safety. Do the brewers grains need to be soaked, and if so, how much? Will it do to feed them to dry cows? Will it do to feed them to yearling heifers? Which are the best, the brewers grains or malt sprouts? R. L. S.

Wapping, Conn.

There is but little difference in the feeding value of brewers grains (dried) and malt sprouts, but the latter are not quite as palatable to some cows and can be fed only in limited amounts.

We think it would be safe to bring cows up by degrees to eat 10 lbs. per day of the dried grains, with 4 to 6 lbs. of ground corn, and silage and hay *ad libitum*, but in feeding that amount of grains we should prefer to soak them for 12 hours before feeding, in order that the stomach might be fully distended during the process of eating.

It is entirely probable that some cows fed as above would lay on too much body fat, and soon as such a condition is observed the allowance of grains and corn should be lessened. A dairyman should always be a careful feeder, with his eyes constantly on the milk pail and the condition of his cows. The cow that does not give a good account at the pail for the feed consumed, but is turning it into unprofitable body fat, should be called to account and have her allowance curtailed. The "grains" can be safely fed to dry cows and yearling heifers, but the amount should be carefully adjusted to results.

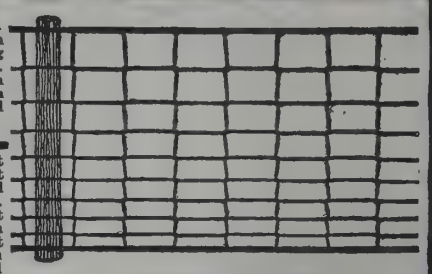
Jamaica Queries.

Where can I get a book that teaches the making of butter and cheese; also the best way to teach cows to eat grain that never ate it before; also please say which breed is the best milkers, viz.: the Guernseys, Jerseys or the Holsteins? R. A. T.

Jamaica, W. I.

Gurler's "American Dairying" and Monrad's A. B. C. of Cheesemaking, are among the best books for the beginner in butter and cheese making. They can be had from this office, postage prepaid, the former for $1 and the latter for $.50.

It is impossible to lay down any rule for teaching cows to eat grain. We have no difficulty of that kind here, except that our cows will sometimes refuse to eat some of the new varieties of feeds put upon the market. In such cases, we try first one way, perhaps by mixing salt with the feed, and if that does not win, some other way, perhaps by crowding a little of the feed into the mouth, so that taste will overbalance odor, or as a last resort, let hunger sharpen the appetite and dispel prejudice.



The Holstein breed of cows is especially noted for yielding a large flow of milk carrying a comparatively low per cent fat—generally between 3 and 4—whereas Guernseys and Jerseys yield less milk, but with a larger per cent of fat—usually from 4½ to 6 per cent. There are deep milking Guernseys and Jerseys, approaching the average Holstein in this respect—the general rule with all being that the greater the yield of milk the less the per cent of fat. If one has a centrifugal separator for creaming milk there is so little room for a choice between the breeds named, whether for butter or cheese, that one may safely follow his individual preferences. Undoubtedly the average Holstein will make more cheese, but what the Guernsey or Jersey may lack in quantity will be made up in quality.

The First Thing to do

If you are going to buy any fence this season, the first to do, for your own protection, is to send for FREE FENCE BOOK

It tells all about ADVANCE FENCING which is without question of doubt the best fencing on the American market. It also tells how you can buy this fence Direct from the Factory at wholesale prices, freight paid to your station, doing away with all dealer's and jobber's profits. It also tells how Advance Fencing is sent to you ON 30 DAYS' FREE TRIAL so that you may have every opportunity of being perfectly satisfied that you have the best that your money can buy. Our Fence Book gives description and prices on twenty-three different styles of woven wire fencing, a fence for every need on the farm, garden or poultry yards, and also tells why Advance Fencing is the most desirable kind to have on the farm. It has many points of merit. It has no loose ends, the stay wire is not cut at the top and bottom as in other fence, but is woven into the top and bottom strands between the stays. The Advance Tie is perfect, the stays cannot slip. ADVANCE FENCE is made of heavy material throughout. You should send for our Fence Book at once, it is FREE. Your name and address on a postal card, directed to us will bring the Fence Book. It pays to keep posted. Write today. Do It Now.

Frank H. Battles, Seed Grower Rochester, N.Y.

Maine State Dairy Meeting.

(Continued from page 1012)

and he has insisted that the cows take the hardy treatment, which along with the cracks in the barns are responsible for the decline of a breed accustomed to better things and capable of greater development under more congenial environment.

Under the title, the Relation of State to Rural Schools, Prof. Sanborn of Gilmanton, N. H. opened the evening session of second day and gave an address on the Origin of the Public School System in New England. He showed that the State claims the right to control the education of the child, and that in a Republic that is right. He also showed that the country schools are in session often less than three months in the year and that the children can make little advancement under this state of afiairs. He insisted that political lines be obliterated, and children be brought by the state to points where good graded schools can be established—schools that will equal those of the large town and cities.

Dr. Fellows, President of the University of Maine, followed with an address on Technical Training for Practical Life. This was given in the easy, off-hand manner of one accustomed to talking on this subject. The illustrations were apt and easily understood.

The Cow, the Friend of the Family, was the theme of R. W. Ellis, who gave some personal experience of early days in the family of an old-time Methodist minister, and how a cow reinforced by her own progeny, helped the family to pay for a little place and thus to own a home of its own. He then enumerated some of the luxuries and necessaries of life, which would be sadly missed if it were not for the cow.

Eight o'clock of the third day was set for examination of the exhibits of machinery and awards of the judges. The cards showing prizes were not in place, however, until midday, and a number of members with ladies inspected a fox farm in the surburbs.

The annual election of officers was set for 8:45 a. m., and occupied a considerable part of the session.

President Alden was unanimously re-elected, but declined to serve longer and after some eloquent urging, he still persisted, whereupon Mr. F. S. Adams, Bowdoinham, was elected president.

The full list of officers elected follow: Vice-President, C. L. Jones, Corinna; Secretary, L. W. Dyer, Woodford's; Treasurer, Rutillus Alden, Winthrop; Trustee, W. K. Hamlin, So. Waterford; Advisary member Experiment Station, Rutillus Alden; Committee on Resolutions, G. M. Gowell, Orono; L. C. Bateman, Auburn, and Z. A. Gilbert, North Greene.

The corresponding secretaries were all re-elected. Some every-day problems on a dairy farm were discussed by the President-elect, and Prof. Hurd, University of Maine, read a very practical, scientific paper on, Relation of the Farm to the Dairy Cow. Hon. S. M. King, South Paris, upheld the Jersey breed with a paper quite as full of facts and figures as was that of the Holstein-Friesian advocate.

Dr. W. H. Jordan, of New York, failed to arrive, and his place on the program was filled, as announced at end of morning session but by whom and the address we did not stop to hear, and also missed Dairy Laws and Their Enforcement by Geo. M. Whittaker, Boston.

The University speakers were accompanied by the Freshman class in Agriculture, a sturdy lot of boys who evidently were alive as to the time and place in which to applaud vigorously. The boys seemed to be attentive to all speakers and profiting by this opportunity to attend a state dairymen's association meeting.

As a source of much deep thought the coming year it seemed to us that the Maine farmers must take into consideration the arraignment of themselves in the careful statements concerning the retrograde movement of the Jersey breed in Maine. They must give their stock more favorable conditions, if they keep the state up in the procession as one of the recognized dairy states. The cows must be bred at home to do this, and they must be born with constitution enough to live, and equal or excel the records of their dams.

The paper by Mr. Gilbert was not much unlike one by one of England's greatest authors and veterinarians, on abuses, which at one period in his time threatened the Ayrshire breed in their native country; but in that case the Scots neglected to breed their own cows, depending on purchase, until the breed was reduced, but here it has been admitted that there are two causes for deterioration; in one case, over stimulation for the encouraging of the milking habit, and keeping the newly introduced breed under conditions less favorable than those to which the breed had been accustomed.

A knowledge of the causes and pointing out the evil effects are the most important steps toward the move to recover the ground lost with these dairy cows. It is not flattering, but the brave friend who has courageously pointed out what he has seen, is thereby doing the state and his brother dairymen a high service. We shall look for a reform and improvement here.

FRANK E. EMERY.

Maine.

"ADVERTISEMENT."

FORGET YOU EVER HAD IT.

Catarrh, the Most Odious of All Diseases Stamped Out, Root and Branch.

Catarrh is the most foul and offensive disease that afflicts the human race. Any one with social ambitions had better renounce them if he has a bad case of catarrh, for his presence, if tolerated at all, will be endured under protest. The foul, and sickening breath, the watery eyes, the hawking and spitting and fetid discharge at the nose make the unfortunate sufferer the most avoided of human beings.

Stuart's Catarrh Tablets are the hope and relief of catarrh victims all over the world. They go direct to the root of the disease and thoroughly eradicate it from the human system. They cleanse and purify the blood of all catarrhal poisons and under their influence all impurities are carried off. The blood becomes pure, the eye brightens, the head is cleared, the breath becomes sweet, the lost sense of smell is restored, the discharges cease and the sufferer again feels that he has something to live for. He is again a man among men and can meet his fellow-beings with satisfaction and pleasure.

The following letter from a St. Louis lawyer is only one of thousands received praising the merits and curative powers of Stuart's Catarrh Tablets. Read what he says:

"I suffered from catarrh for 15 years. It would be worse at certain seasons than others, but never failed to annoy me and cause me more or less misery during that period. About a year ago I got so bad that I thought of abandoning my practice. I was a nuisance to myself and all who came near me. My condition was very humiliating and especially so in the court room. I had tried, I thought, every known remedy; all kinds of balms, ointments, inhalers, sprays, etc., till I thought I had completed the list. I was finally told of Stuart's Catarrh Tablets by a friend who took pity on me and, as a drowning man will catch at a straw, I got some and began taking them. I began to improve from the first day and I kept up the good work you may rest assured. In six weeks I was as free from catarrh as the day I was born, but to make assurance doubly sure, I continued the treatment for six weeks longer.

"I have had no trace of catarrh in my system since. I am entirely free from the odious disease and feel like a new man. I write this letter unsolicited for the benefit of fellow-sufferers and you may give it as widespread publicity as you wish."

Stuart's Catarrh Tablets are for sale by all druggists at 50 cts. a box.

"Money Makers for Butter Makers"

Even though it were not apparent that

COLONIAL BUTTER SALT

AND

LIBERTY BUTTER SALT

are superior to all other kinds in flavor, color and purity, there would always be apparent the fact that they are superior in lightness, bulk for bulk. Take the barrel that holds 320 lbs. of the other man's salt; it will hold but 225 lbs. of Colonial Butter Salt. The usual salt barrel has a 30 inch stave and a 19 or 20 inch head. The Colonial barrel has a 34 inch stave and a 21 inch head, to hold the same net weight of salt.

The lightness of the salt makes it dissolve quickly and evenly and prevents washing out in the working, and if there is any value in the "make weight" theory, this salt stands at the head in that respect.

THE FLAVOR IS PERFECT
THE COLOR PERFECT WHITE

The purity over 99 per cent, hightest in the world. PROVE IT YOURSELF. To those who have never used Colonial Butter Salt (light, flaky grain) or Liberty Butter Salt (granulated) we shall be glad to deliver, free of charge, to creameries and cheese factories only, a 56 lb. sack of either or both, on request. We only ask, in return, that you report to us your actual success with our salt.

Won't you try it today.

COLONIAL SALT CO., AKRON, OHIO

CHICAGO OFFICE.....841ADAMS ST.

BUTTER FOR UNCLE SAM

THE CONTINENTAL CREAMERY COMPANY
TOPEKA, KANSAS

Has been awarded the contract to supply the United States Navy with half a million pounds of butter for the ensuing year.

For this purpose only the best quality of butter is used, and its keeping quality must be made of the very best, owing to the fact that the entire year's supply must be made within a few months and it is carried through all conditions of climate.

The government has made a thorough study of supplying butter to suit the requirements of the Navy and as a result it has laid down some very exacting standards to which those who bid for these contracts must comply. One of the few concerns who can fulfill these requirements is the Continental Creamery Co. and it was awarded this contract, which is the biggest single order for butter ever filled.

This company produces the greatest quantity of fancy creamery butter in the world, all of which is made from pasteurized cream. Surely it knows something about making good butter. It also knows from actual experience and the investigations of its chemists, that one of the factors in making good butter is

EXCEL GRINDING MILLS.

The Mill that excels them all. Best for the farmer. Grinds 5 to 25 bushels per hour of ear corn or grain of any kind, bone, shell, etc., with from 1 to 8 horse-power. Makes best feed and good meal. Furnished with or without crusher. We have larger mills for every purpose. Write for Catalogue E.

We pay the freight.

Excel Manufacturing Co.,
118 Liberty Street, New York

SAVE FEED.

Feed is fuel to the animal economy. It is burned up to supply internal heat. If it is heated (cooked) before it goes into the animal's stomach it saves that much fuel (feed).

Electric Feed Cookers

save feed, save money, and produce better results. Made of best cast iron with steel linings; boiler made of extra heavy galvanized steel. Capacity 25 to 100 gallons. Circular and price free.

Electric Wheel Co., Box 130 Quincy, Ills.

ROSS FEED CUTTERS

will save you money. Send for our Free Booklet No. 36 and learn how you can double the value of your corn crop.

SEND 10c for Prof. Wolf's Book on Silage.

THE E. W. ROSS CO.,
Springfield, Ohio.

ROSS ROSS

Farmer's Favorite Feed Cooker

is the model for cooking feed and best adapted to water heating, soap, apple butter and sugar making, etc.—a score of uses. It's made to last. Weight greater than any other cooker of same low price. Write today for circular. Sent free on request.

L. R. Lewis, 10 Main St. Cortland, N.Y.

BOWSHER

(Sold with or without elevator)
CRUSH ear corn *(with or without shucks)* and **GRIND** all kinds of small grain. **Use Conical Shape Grinders. Different from all others.**

LIGHTEST RUNNING.

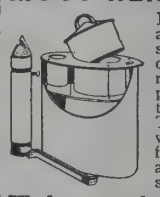
Handy to Operate. 7 Sizes—2 to 25 h.p. One size for windwheel use.

Also make Sweep Grinders; Geared and Plain.

N.P.D. Bowsher Co., South Bend, Ind.

FEED MILLS

The Best Cooker

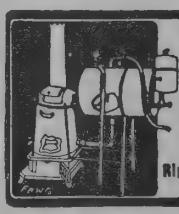


for preparing feed for all kinds of stock is this

PURINTON'S No. 2 Steam Generator

Made of Boiler Steel and tested. Has safety valve and jointed pipe reaching a dozen barrels without unscrewing. All stock thrive better on cooked feed and steam cooked is the best. Never gets burned or scorched. Best boiler for scalding hogs, cleaning around dairies, etc. Quickest steamer on market. Burns any fuel and less of it than any other. Our water supply tank is a great convenience. *We will send a Cooker complete and ready to use on* **One Week's Free Trial.** Catalogue free.

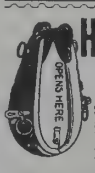
Purinton Mfg. Co. Dept. E, Des Moines, Ia.



MOST HEAT—LEAST FUEL

Largest firebox. Least expense and trouble. Burns wood, cobs, straw, etc. Jacket and bottom of heavy galvanized iron (double rivited.) Two heavy cast iron plates 8 inches apart compose the double top (our patent.) This double top space connects with manhole and smoke-stack, forming dead air compartment and keeping fire below water surface which saves the heat.

We have a valuable book called "Warm the Water and Save the Feed," which we will send you FREE. It's worth $1.00.

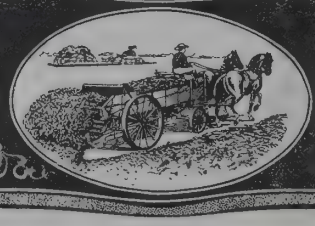


WINONA TANK HEATER
is unconditionally the best heater made. Price $6.50. We pay the freight. Address
WINONA TANK HEATER CO., 82-2ND ST. WINONA, MINN.

RIPPLEY'S Improved Combination STEAM COOKERS

will cook 25 bushels of feed in 2 hours; heat water in stock tank 250 feet away. Will heat dairy, hog and poultry houses. Made of boiler steel; can't blow up; no flues to rust or leak. PRICES $5.00 TO $45.00; 5 styles and 15 sizes. Sold under a guarantee. Endorsed by Experiment Stations. *Catalogue and prices free.*

Rippley Mdw. Co., Box 20 Grafton, Ill.



Hameless Horse Collars $1

GALVANIZED STEEL; no pads; adjustable in size; is better and cheaper. Do not gall but CURE SORE SHOULDERS. Send $1.00 and we will send one to your railroad station with privilege of examination before paying balance. Write for particulars. Agents Wanted.

HOWELL & SPAULDING CO., Dept. 5 Caro, Mich.

NEW AMERICAN MANURE SPREADERS

hold from 50 to 100 bushels. Spread just as thin or thick, fine or coarse, as the ground requires. Don't have to stop team to make change. Most substantial, largest capacity, lightest draft. Finely illustrated catalogue free.

AMERICAN HARROW CO.
1436 HASTINGS ST. DETROIT, MICH.

Let The TUBULAR Help You

PERHAPS—if your dairy had paid one-third, one-quarter, or one-tenth more—you'd feel that the past season had been a success.

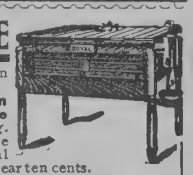
The TUBULAR would have saved from 10 to 30 per cent of cream that was wasted by other methods of skimming. This means making more butter—more money.

PERHAPS—if you and the wife had less work to do you'd feel that dairying was more of a pleasure—that life was easier. Perhaps your wife would be stronger and happier.

The TUBULAR would have saved both of you almost half the work of caring for the milk. There would have been no pans or cans to wash—no milk to warm for calves and pigs. The Tubular would have made all that unnecessary.

PERHAPS you've made up your mind to get a cream separator and make your work easier—your wife happier—your bank account bigger—last season's failure the last one.

The TUBULAR will naturally suit you best, because it has a low supply can—enclosed, self-oiling gears—no oil cups—no bowl complications—won't bind, or require costly repairs—because it's the only separator having these labor saving, money saving features.



YOU'LL learn all about it if you'll write for free Catalog No. 144

It puts the work of the kitchen upon a business basis—everything handy, sanitary, dust-proof and mouse-proof; easy to keep fresh and clean. Booklet tells why.
Thousands of our cabinets sold—eight styles. Every home-maker wants one. Write to-day for booklet. A postal card will do.
Elwell Kitchen Cabinet Co. 926 5th Ave. SE. Minneapolis.

U. S. VICE-CONSUL ADOLPHE DANZIGER writing from Madrid under date of October 12, 1903, says that the government of Spain is to open 14 agricultural schools in various parts of the peninsula. They are to be practical means of educating farmers not only in regard to the crops raised, but in the use of agricultural machinery and implements. While they will be governmental institutions, the contracts to equip them will be let to private parties and bids are soon to be asked for.

Using the Smoothing Harrow on Corn.

ED. HOARD'S DAIRYMAN:—In your last paper, of Dec. 11th, T. R. W. asks for experience in regard to harrowing corn after it is up.

I always try to keep the ground mellow and free from lumps and weeds by dragging once or twice before corn is up. Then when it is two or three inches high drag again and if possible once or twice more until it is all of six inches high and large enough to cultivate.

If the ground is not lumpy it will not injure the corn, and it preserves the moisture by forming an earth mulch, and kills the weeds at the right time. It not only kills the weeds that are up, but the seeds that are just sprouting are exposed to the sun and killed. It also starts the corn to growing wonderfully.

I drill all of my corn and put it in plenty thick and then if a little is covered up or dragged out, it doesn't matter. The corn should not be dragged the first two or three days it is up, for then it is so brittle it will break off.

As T. R. W. says, it does seem rough, and while you are doing it you will be tempted to stop at once. But don't watch your drag. An old farmer once said that "a blind man was the best man to drag corn." Just try a few acres next year and see which does the best. I generally drag across the rows, but many people prefer to go lengthwise.

Oshkosh, Wis. R. F. M.

ED. HOARD'S DAIRYMAN:—In reply to the inquiry of T. R. W., page 997, would say that I have secured very satisfactory results from the use of smoothing harrows in the cornfield.

Start the harrow with teeth pointing backward as soon as the corn is planted and repeat at least once a week until the corn is 6 or 8 inches high and the benefit secured will far offset any damage from uprooted corn or the tramping of the horses.

Harrowing across the rows once or twice, before the corn is two inches high, has been a marked advantage in my experience.

I have had just as good results from the use of the harrow in the various small grains, when sown for soiling or hay, and I am satisfied that if T. R. W. gives the above treatment a careful trial, he will find it both "safe and good farming."

Amherst, Mass. L. L.

FROM MILL TO CONSUMER

You are interested in the strength, purity, uniformity and cost of the feed you buy. Direct dealing with the mill gives you information in regard to these points which you cannot secure when buying feed at random, in bulk.

Once having investigated a mill's product and finding it satisfactory, you can continue your buying from that mill with a confidence and assurance you cannot otherwise feel, providing the mill is reliable.

Buy **ELMCO** Feeds and you know exactly what you get. The Wisconsin Experiment Station has analyzed them, we herewith show the result.

University of Wisconsin Agricultural Experiment Station, Madison, Wis., November 10, 1902.

	Moisture	Crude Protein flesh forming substances	Ether Extract (fat)
ELMCO Red Dog	9.55	22.19	5.40
ELMCO Fancy White Mdls.	10.08	19.38	5.43
ELMCO Standard Mdls.	9.30	20.00	6.15
ELMCO Fancy Bran	10.00	16.63	4.78
ELMCO Mixed Feed	10.23	17.50	5.13

The analysis show the feeds to be of superior quality. I have made a careful examination of the feeds and find them to be pure goods, without any foreign admixtures. F. W. WOLL, Chemist.

ELMCO Feeds are made from carefully selected hard Spring wheat, milled for best feeding results. They are put up in 100 and 200 lb. sacks, branded with our trade mark "ELMCO," which guarantees full weight, absolute purity and strength. Quality considered, they are the most reasonable feeds you can buy. They contain more protein and fat for a Dollar than ordinary feeds. Ask us for samples and prices.

Ask your Banker as to our reliability.

Fourteenth Annual Meeting of the Missouri State Dairy Association.

ED. HOARD'S DAIRYMAN:—They held it, as announced in the DAIRYMAN, at Clinton this year, And Clinton was a very nice place to hold it. The men of that country all extend to the dairymen the glad hand, and the young ladies all sing and play songs; and music has charms for the Missouri dairyman.

The meetings were held in the rooms of the Clinton Business College, and connected with this excellent institution is a wonderful conservatory of music, and every time President Marples would come to a vacant place on the programme, he would throw some kind of a sign, and out of the repository or depository of music would come a brand new girl, who with her music would drive from the troubled souls of the dairymen every dairy care. Then there was an orchestra every evening, and more sweet-singing of girls we had never heard before and may never hear again, alas! with especial mention of one sweet singer, who always came with the orchestra, and she should have been made an honorary member. They made Secretary of Agriculture, Geo. B. Ellis, Prof. E. H. Webster, Dr. Geo. Tucker and W. F. McSparran, honorary members and even that good array could have been improved as above suggested.

Mr. Mayor Armstrong gave the Association a wide open welcome to the city, and J. L. Erwin responded for the association. W. W Marples, president, in his very happy address, spoke of what the dairymen in Missouri had done and listed a few of the things they should do and told everybody to keep busy during the short time of meeting, and everybody did so. Mr. Marples is a strenuous officer and has been ably assisted by secretary C. H. Eckles and treasurer B. C. Settles. The membership now amounts to something over two hundred; the treasury has a balance of over $50 on hand, and this, too, without any state aid.

That veteran dairyman from Kirksville, Uncle John Patterson, told "My Experience with the Silo." His first experience was that he wanted one for some time before he got one. Then in 1897 he built a 300 ton stave circular silo. He filled it with corn and cow peas and only observed the full value of such feed as he got out of it, when upon turning his cows to pasture they shrank in milk, notwithstanding he fed them grain with the pasture. Since that experience he has built three more, 16x16x30 feet, giving him in the four, 600 tons. Last season he used sixty-six acres of corn and thirty-seven acres of good cow peas to fill them.

Following was his cost of filling per day:

Engine and engineer	$5.00
3 men cutting in field	3.75
4 men with 3 wagons	5.00
2 men at machine	2.50
1 man cutting cow peas	1.25
3 men hauling cow peas	3.75
1 man in silo	1.25
	$22.50

Day hands began at seven o'clock and quit at six, witn an hour at noon. Regular hands who helped milk, worked at filling only between milkings. Required 20¼ days to do the filling. In addition to this silage, fed twice a day, he feeds about three pounds of bran and at night a little mixed hay. He is now milking 71 cows. Mr. Patterson regards silage so highly as a dairy ration that he cannot understand why so many corn farmers are satisfied to waste so much valuable feed in their neglected stalks.

"Home Grown Balanced Rations" was the topic most carefnlly treated by Judge W. M. Love, of Osceola. The balanced ration was defined in its relation to growing the cows and the subsequent feeding of them. By using the leguminous crops, such as clover, cow peas, soy beans and alfalfa, in the Judge's opinion, a profitable ration can be grown at home. He would take corn silage as his base and supply the other needs of the ration from hays from the legumes.

The small grains grown on a given land will not buy from their proceeds as much protein as the same land will produce in the clover, alfalfa or peas. He cures cowpeas into hay by raking immediately after the mower, making small cocks and letting the vines cure in these without being disturbed. The cocks are so small they dry readily if they are rained upon. The cocks are not touched till ready to haul to barn and thus handled with minimum loss of leaves.

Mr. Jos. Elliott prefers corn to sorghum and mixes corn and cow peas for silage when he has the peas, and likes the combination.

Mr. Brens has a silo built of 2×4's painted with gas tar inside and it has been very satisfactory. Grows corn and cow peas together and harvests with a binder and gets a good feed; uses Clay and Whip-poorwill peas. Uses corn and peas for fall feeding in pasture till frost kills the peas.

"The Cow for Missouri and How to Get Her" was discussed by W. F. Mc Sparran, who had judged the cows in competition for two prizes offered by the citizens of Clinton, and was asked to give his reasons for his judgment. B. C. Settles followed on this subject and of course the Jersey got some talking about at the hands of those fellows. Mr. Settles said he was milking twenty pure bred Jersey cows, and last year made $75.15 each from them in sales of cream alone, with calves and skim milk for additional profits. This present year is not ended, but will have a better showing for it.

President Marples said he had recently made a trip through part of Canada and some of the best dairy sections of the east and found the Canadians were selling butter fat for three cents a pound less than than dairymen in Clinton were getting, and within fifty miles of New York city the price was no higher than here.

Mr. Plummer began with a good Jersey bull to use on good Shorthorn cows and has bred up a profitable herd. Always uses the best Jersey bull he can get. He finds he must breed good cows if he wants them. Sold $2,040 worth of butter last year from 40 cows and at present production for this year will sell 2,000 pounds more from 43 cows, and gives the credit for part of the increase to his having fed corn and bran while on pasture.

Dr. George Tucker of Columbia, Mo., by a colored map of the state, showed the distribution and location of land on which alfalfa grows satisfactorily and all the stages of success down to failure. Much of the Missouri land has been so continuously cropped that organic matter is largely exhausted and the soil is acid. Alfalfa will not grow on this land. In many cases this acidity will probably be corrected by the use of lime, and the experiment station is now making experiments to determine the amount of lime necessary to neutralize this acid. He is encouraged to think that with a little more light on the needs of the plant, alfalfa can be grown in most parts of the state. On land in alfalfa that was overflowed last June and under water for fifteen days, the plants were not destroyed, but sent up new green shoots as soon as the water passed off.

Major Day said that he was growing alfalfa on hard-pan land with eight inches of soil and about the same depth of hard-pan, and was surprised to find the roots had grown through the hard-pan.

"The Labor Problem on the Dairy Farm" was handled variously. Mr. Goodrich finds the Golden Rule in dealing with his hands, good to have in operation. Judge Love does, also, and gives many privileges to his hands. He disclaims making much money but they all have a living and are glad of it. Mr. Wolf finds his wife and daughters his best milkers and they like to do the milking. Mr. Patterson says hands have changed greatly within the last few years. They used to respect a contract, while now many of them respect nothing. They are here today and gone tomorrow. He says he hears much complaint about his countrymen—Swedes—being unreliable as workmen but he thinks they are better when they first come than they are after being here some time. "Many farmers," said Mr. Patterson complain that dairying is so confining. It may be, but it confines a man at home, and that is a pretty good place to be confined."

"Cheese Making in Missouri" was treated masterfully by Frank Moulton, of Cowgill. He made a plea for better cheese factories so that the operator would have full control of temperature and ventilation; for better handled milk and, better understanding of the needs of the markets. Cheese should be ripened at the factory where conditions favorable to best curing can be governed.

At the Wednesday evening session, W. F. McSparran of Pennsylyania read a paper entitled "What the Dairy Cow Would Do for Missouri," and Milk Inspector Robert Pethebridge, of St. Louis, took up "The Problem of City Milk Supply."

The butter making contest at the Clinton Creamery Thursday morning was participated in by Inspector Pethebridge and a woman butter maker, the former winning the victory and carrying off a gold medal.

There were a number of butter and cheese entries in their classes. The scoring was done by Prof. Webster. Henry Green, butter maker for Mr. Patterson, won first on butter, on a score of 96½, entitling him to the Association gold medal and silver cup and a special prize of five dollars, offered by Prof. Eckles to the first prize winner if he had been a student at the Columbia University. The second prize went to the Blue Valley Creamery Co., of St. Joseph, score 96¼.

Thursday morning, "The Hand Separator and the Creamery" was discussed by Prof. Webster and Rudolph Miller, from the standpoint that the system of cream gathering instead of the old system of milk gathering, is more profitable and much less laborious for the dairyman.

J. A. Walker, manager of Blue Valley Creamery Company, read a very exhaustive and valuable paper on "Business Management in the Creamery." There should be good business management in creameries, for only by such management can fair and equitable returns be made to the producer of dairy products. What often would represent a clear profit for the business is lost for lack of careful oversight on the part of a good manager.

Few creamery managers regard it as necessary to qualify themselves for their business and for very lack of such qualification, many a creamery that should succeed, is added to the list of failures.

GUERNSEYS AT PASTURE.

Management of the whole business is too often turned over to the butter maker, who, in his anxiety to make a good showing of his management frequently fails in making good butter, by reason of some false idea of economy. There should be definite market quotation for butter fat, for only by that means can the abuse be stopped of allowing the creamery to be run loosely and wastefully, leaving the dairyman an unsatisfactory return when the creameryman gives him what is left.

In many cases there can be a fearful waste in the one item of salt, while a spoonful of cream left in each can where a thousand cans a day are received, will mean a loss of over a thousand dollars in a year. The old officers were re-elected for president, secretary and treasurer, with Wm. Plummer and W. M. Love, first and second vice-presidents.

Penn. W.F. Mc S.

A Visit to Geo. M. Clark's Grass Farm.

ED. HOARD'S DAIRYMAN:—It was a pleasant trip that the writer made last Labor Day morning from Hartford, Conn., down the Connecticut Valley railroad, to Higannum, to visit the almost world renowned grass farm belonging to Mr. Geo. M. Clark. Mr. Clark is an elderly gentleman, but robust and resolute, capable of carrying on, as he does, a half-dozen lines of work and thoroughly enjoying the task.

From the station one can look across the river to the old Clark homestead, where Geo. M. and his brothers fought out the debts on the old farm, bought adjoining land, erected the house with their own hands by working on it at odd hours for two or three years, and here they studied with only their books for teachers. Mr. Clark says there are 1,400 mortises in that house and he seems to remember every one of them. Interesting country there and the Connecticut is an attractive stream.

Below the station is the site of the old ship-yard, where Mr. Clark built sailing craft when sail ships were the fashion and New England held the industry. It was down on the coast of the Sound, however, that he built, in 1851, the largest ship that up to that time, had ever been constructed, a boat of 1,700 tons capacity. How different from the boats of these days, which have a tonnage of eighteen to twenty-two thousand, and what a change in one man's lifetime! The Great Eastern of 24,000 tons capacity followed within a few years the construction of Mr. Clark's modest boat.

Back to Higannum, and we start up the highway, along which are numerous evidences of Mr. Clark's forethought, enterprise and industry as exhibited in the excellent roadway with improved grades, bridges, etc.

The Clark factory is soon in sight, with its three or more acres of floor space, and, although silent, as behooves on a holiday, yet in the office is Mr. Clark as busy as though Labor Day had never been invented. Not too busy, however, to go up to the farm and point out the plots of ground of exactly so many square rods area, from which a certain definite number of crops have been harvested, in just so many years. The figures of pounds of hay and pounds of fertilizer are ready for you at a moment's notice.

Some people have expressed doubts as to Mr. Clark's statements, but I have no hesitancy in accepting them, nor do I doubt that it is intense cultivation that has been instrumental in bringing about the results he claims. The little plot of ground in one corner still in its original condition, with its rocks and weeds, is suggestive of the labor that has been done on the improved areas.

The stand of red top and timothy, free from weeds or other grasses, is proof that cultivation must have been intense, and long-continued to kill out all vegetation not wanted. The closely standing spires of grass are evidence not only of thick seeding, but of a fine soil for seed bed, such as would enable the germination of a larger proportion of seeds sown, than is usual. Go to the barn and see the hay, bright and green in color, stalks of a length that suggest getting lost in a grass field, and almost as fine as silk.

All these things are in evidence and speak for themselves. These and the full mows almost tell the story of production, especially after seeing the fields September first, and noting the growth that is being made. Almost the only item that one needs to have corroborated is the amount of fertilizer used, and it is hardly necessary to call into the account Mr. Clark's well-known record for honesty when one reads the figures representing the amount of commercial fertilizer applied. To suggest 700 pounds of high grade fertilizer per acre each year might tend to frighten some farmers, but Mr. Clark makes it pay. Of course, he believes that the liberal use of his cut-away harrow has done much to increase profits.

Why should it be thought any more difficult to secure the growth of 8,000 pounds of hay per acre than to get 8,000 pounds of milk from a cow in one year? True it is only an occasional cow that can be made to produce that amount, while Mr. Clark thinks it is possible to equal his records on almost all fields, if one will take the necessary steps to do it.

Recent soil investigations, conducted by the National Government, indicate that there is sufficient plant food in practically all soils to produce abundant harvests, and that the supply is maintained indefinitely by the disintegration of soil particles. It is the method then of handling them that determines crop returns. This appears to be the foundation of the Clark method.

Some of the characteristics of that Connecticut valley soil, what others have done with it, and what may be done with other soils, may well be discussed at another time. H. H. LYON.

Chenango Co., N. Y.

Marples' Tribute to the Farmer.

ED. HOARD'S DAIRYMAN:—In his opening address to the fourteenth annual meeting of the Missouri State Dairy Association, President Marples said in part:

"The farmer of yesterday had hay seeds in his hair. He hasn't today and is not accused of it. He was yesterday simply a voter, and as such was convenient. He was the recipient of one hearty hand shake every year, from the man, who, when elected, had marked on his door, "Private," which practically meant that no farmer need apply. His children were kissed once a year by the man who went to the legislature and voted against an appropriation for an agricultural school.

Today he not only exercises the right of franchise, but his voice is heard among the law makers, and his children don't have to go outside the family to kiss a senator. Yesterday he got his information from Ayre's Almanac to day are found in his library the leading periodicals of the times. Yesterday he didn't want work on a farm if he could read and write; today he can't get it unless he can read and write. Yesterday he responded to his country's call when it was in trouble and followed the would-be leader even to defeat; today he stands at the head of a battalion and leads them to victory.

Yesterday, he was pitied; today, he is envied; yesterday, he was the laughing stock of society; today, he is the admiration of the world. Yesterday, he worked only with his hands; today, he works with his head. Yesterday, his success was luck. Today, it is science. Yesterday, his work was drudgery; today, it is pleasure. Yesterday, his acquaintanceship was circumscribed. Today, it is boundless. Yesterday, the bank owned him. Today, he owns the bank. Yesterday, he furnished the brawn. Today, he furnishes the brain and we will continue to draw upon him as our stock becomes exhausted, and he will be depended upon, not only to promote his own business, but to look after other lines.

Yesterday there was a little log schoolhouse in his district, where they had a very common school three months in the year, and his children attended when the weather was too bad to shuck corn; to-day he is provided with a good, strong agricultural school, where the children can attend and graduate, not only in those things that fit them for their particular line of work, but in other of the arts and sciences if they desire. Yesterday he sent to town for his mail and he seldom got any; to-day the town sends it out to him and he always gets some. Yesterday he was the victim of unscrupulous speculators in selling his products; to-day when he sees the stock buyer approaching, he learns what the market is from the commercial centers of the world before the man has time to hitch his horses.

Penn. W. F. Mc SPARRAN.

It Pays to Have a U. S. Separator

It is the best money-making and money-saving machine a dairyman can have.

It makes more money by getting more butter-fat out of the milk.

It also makes more money by leaving the cream in such fine condition, that the butter made from it takes the Premiums at the Fairs and elsewhere. If you do not believe it, read the following letter:

$65 U. S. Separator Earns $53 in Premiums First Season

SPRINGFIELD, ILL., OCT. 31, 1903.

At the State Fair this fall I took the two Blue Ribbons on Pail and one on Print, the **White Ribbon and Sweepstakes on Dairy Butter.** I used a United States Separator (No. 8, $65.00) purchased this year, and my premiums amounted to $53.00. Quite a help in paying for my Separator. It is needless to say I am well pleased with it, and find it profitable to have a U. S. Cream Separator.

MRS. W. M. CORRINGTON.

We find by reference to our list of premiums paid on Dairy Exhibits at the Illinois State Fair of 1903, that Mrs. W. M. Corrington received premiums amounting to over $53.00 in that Department as stated above.

W. C. GARRARD,
Sec'y Illinois State Fair.

The above is only additional proof of what thousands of dairymen all over the country are daily finding out—that

In order to make the most money out of cows, it is necessary to have a U. S. Separator.

THE NEW YORK DAIRY CONVENTION.

[Editorial Correspondence.]

I have been spending nearly two weeks in the grand old dairy county of St. Lawrence, New York. Last week was occupied almost entirely in attendance upon the New York State Dairy Convention at Ogdensburg.

In point of attendance, quality of the papers and addresses delivered, and the show of butter and cheese, as well as the exhibit of dairy machinery and supplies, it was by far the finest state convention I have attended in many a year, if I except those of Wisconsin. The daily attendance was large. The great Opera House with two galleries, was filled each afternoon and evening. The morning sessions of each day were given up to the dairy display. I could hardly endorse this feature, for the reason that the display of dairy machinery, although an attractive feature on such occasions, is not the first and most important consideration. The first great object is to get hold of the mind of the farmer, the man who makes the milk, and just in proportion as he is instructed and educated in the knowledge that makes for larger success in dairy practice, will the dairy supply men be benefited. Reverse the process and the business will soon die out.

There were some splendid contributions to the knowledge and understanding of men, on this great general topic of dairying. Among the most valuable were the following:

"On the Potential Cost in the Saving of Labor on the Farm in the Last Fifty Years," by Hon. Geo. L. Flanders, Assistant Agricultural Commissioner of New York. This was a profound and most valuable address.

The address of President H. E. Cook, which was full of the meat of good things; "Market Milk" by Prof. R. A. Pearson of Cornell College. This was indeed a most thorough review of what must have been done at every step in the way to produce milk that is pure and truly marketable. The facts and ideas brought out are just as valuable for the patron of a creamery or cheese factory, as for the producer of city milk. The topic was ably discussed also by Mr. Jared Van Wagenen Jr. of Lawyersville, N. Y. "Two Years' Experience With Consolidated Cool Cheese Curing Rooms" was an address by the able Assistant Dairy Commissioner of Canada, Prof. J. A. Ruddick. It was most exhaustively treated by Prof. Ruddick and most ably supplemented by Prof. L. L. Van Slyke of the New York Experiment Station. It would be to the great advantage of every cheese maker in the land if they could have heard these two learned as well as skillful experts on the subject of Curing Cheese.

Prof. Ruddick also gave a fine lecture Wednesday evening on "Dairying in New Zealand" illustrated with stereopticon views. Then came the splendid address of Dr. W. H. Jordan of the Geneva Station on "The Status of Agricultural Practice." In short, this address was a condensed review of the progress in ideas, methods and scientific uuderstanding which has come to the American farmer in the last one hundred years.

His lecture was a good illustration of the great fact that the most unwilling and ignorant of farmers are unconsciously worked upon and lifted up in their practice by the progress that takes place around them. Many a farmer is pursuing methods today for which he is indebted to the enterprise and intelligence of other men, while he himself is almost unconscious of where he got his knowledge, or how he arrived where he is.

Thursday afternoon the Senior Editor of the DAIRYMAN gave an address on "A Study of Dairy Success from a Farm Standpoint."

A most valuable address was that of Prof. Thos. F. Hunt, of Cornell, formerly of the Ohio State University. His topic was "Relation of Forage Crops to Milk Production." A world of valuable suggestions, drawn from close, accurate experiment and trial, was given in this lecture. Then Dr. Bailey, Dean of the Cornell College of Agriculture, gave an able and comprehensive review of "New York as an Agricultural State."

A most cheering feature of this great convention was that every speaker, nearly, and the central idea of the officers was directed toward the dairy farm.

This was not merely a creamery or cheese factory convention, a taking up of a secondary idea to the exclusion of a primary one. Every one seemed to feel that the whole procession, every step of progress, must wait upon the man who produces the milk. If he can be made to move, if he can be awakened and made to cry out, "Men and brethen, what shall we do to be saved?" then progress of the most desirable character will quickly come to every branch of the great dairy interest.

The New York Dairymen's Association is ably officered. There are no better men in the field today than its earnest secretary, Mr. W. H. Hall, and its president, H. E. Cook, as well as the treasurer, F. E. Dawley. These three men "live, move and have their being," with an eye single to the efficiency of the work given to the Association to do. It was a comfort and source of instruction for us to attend this memorable convention.

The week following we had the privilege of addressing meetings composed of dairymen, under the auspices of local granges in West Stockholm and at Madrid. We found that the dairy farmers of St. Lawrence county are arousing themselves to a realizing sense of the problems that confront them. They have been going on for years, hardly conscious, we might say, that gradually their farms were losing fertility, the value per acre was constantly going lower, and but little real earnest attention was being paid to an economic study of what good dairy farming meant.

The young men of the Grange are doing good work here. One of the most earnest is Mr. W. E. Griffith, who is an instructor in Cornell College. It cheers our heart greatly to see this sign of a better order of things in the grand old Empire state. W. D. H.

"ADVERTISEMENT."

MEMORY MENDING

What Food Alone Can Do for the Memory

The influence of food upon the brain and memory is so little understood that people are inclined to marvel at it.

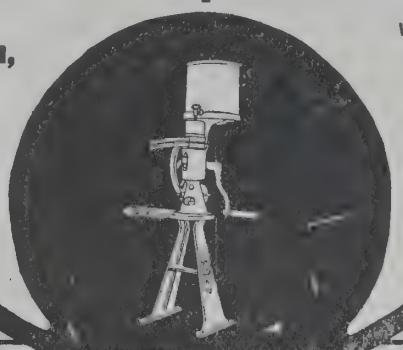
Take a person who has been living on improperly selected food and put him upon a scientific diet in which the food Grape-Nuts is largely used and the increase of the mental power that follows is truly remarkable.

A Canadian who was sent to Colorado for his health illustrates this point in a most convincing manner: "One year ago I came from Canada a nervous wreck, so my physician said, and reduced in weight to almost a skeleton and my memory was so poor that conversations had to be repeated that had taken place only a few hours before. I was unable to rest day or night for my nervous system was shattered.

"The change of climate helped me a little but it was soon seen that this was not all that I needed. I required the proper selection of food although I did not realize it until a friend recommended Grape-Nuts to me and I gave this food a thorough trial. Then I realized what the right food could do and I began to change in my feelings and bodily condition. This kept up until now after six months' use of Grape-Nuts all my nervous trouble has entirely disappeared, I have gained in flesh all that I had lost and what is more wonderful to me than anything else my memory is as good as it ever was. Truly Grape-Nuts has remade me all over, mind and body, when I never expected to be well and happy again." Name given by Postum Co., Battle Creek, Mich.

There's a reason.

Look in each package for a copy of the famous little book, "The Road to Wellville."



EMPIRE

There is no royal road to success, but there are roads which are harder than others. There is no way to make money out of dairying without work, but there are ways easier than others. The EMPIRE way is the easy way. It is the way to make the most profit with the least labor and the least expense. It is the most satisfactory way. The EMPIRE Cream Separator is the easy machine to operate and the most profitable machine to use. It is easy to buy because the increased profits pay for it. It is easy to operate because of its simple construction. Our book tells about the EMPIRE way of dairying and about the EMPIRE Cream Separator. It is free for the asking.

Empire Cream Separator Company,

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of them read dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own light who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

SKIM MILK FOR POULTRY.

It has long been a conviction with us that the farmer could use his skim milk more profitably feeding to poultry than in any other way.

As the matter now stands, farmers feed it almost wholly to pigs or to calves. To get the most money possible out of it should be the business instinct and purpose of every farmer. Poultry of all kinds, whether devoted to egg-laying or meat purposes, are in strong demand. Then, besides, there is a strong, growing demand for poultry of the best improved breeds. Mr. T. E. Orr, Secretary of the American Poultry Association makes the following statement:

"My experiments have demonstrated these facts: A hen eats sixteen times her own weight in one year; her eggs in the year are six times her weight; they bring 16 cents per pound; her food costs 1 cent per pound, and her yearly product is worth six times the cost of her food."

Other authorities estimate that the farm hen costs in feed from 47 to 83 cents a year, the average being about 65 cents.

As the farm separator system increases and the farmers succeed in producing skim milk in the best possible condition for feeding, they are gradually awaking to an understanding of the importance of the skim milk question in cold cash.

It becomes then a vital and important point to determine what we will feed the skim milk to. A certain number of calves we must and should raise. Well handled, the skim milk fed to nice grade heifer calves will return fully double the money that it will if fed to pigs. But we do not need to raise pigs if it is more profitable to raise poultry and feed our skim milk to them instead. The figures Mr. Orr gives, affords us guide lines for study, and our readers will find it profitable to consider them in connection with their skim milk.

Some experiments by the Indiana Experiment Station are pertinent to this question: Two pens of ten chickens each were taken; the chickens were from four to six weeks of age. One pen was fed all the skim milk it wanted; the other was fed none. The grain fed consisted of two parts of crushed corn, one part bran and one part ground oats. They were also fed cracked bone, cabbage and lettuce. At the beginning of the experiment, July 11, the total weight of one lot of chickens was only a half ounce greater than the other. Sept. 5, the result showed the skim milk chickens ate considerable more grain than the other.

The chickens of the lot receiving no skim milk, made an average weekly gain of 2.62 ounces, while the lot that were fed skim milk, made a gain per week of 4.46 ounces or over one-fourth of a pound. This experiment will serve well to show the comparative difference caused by the skim milk.

THE IOWA DAIRY SITUATION.

Statistics show a decided falling off in Iowa dairy products. This is explained, in part at least, by the fact that more and more attention has been given to raising and fattening steers, and less and less attention given to breeding better dairy cows and handling them in accordance with modern dairy ideas. In view of the present and prospective prices for beef and pork we wonder how those Iowa farmers feel who switched off from the straight dairy track, expecting to gather fortunes from steers and hogs. While it is true that dairying does not now offer, and, for that matter, has never offered, sudden wealth, it is equally true that the farmer who has consistently and persistently made the dairy cow his friend, and has treated her as a friend should be treated, has never, in any year, had occasion to regret misplaced confidence.

Iowa farmers have been peculiarly unfortunate in the advice given them, to the effect that it was practicable to have a paying dairy herd where all the male calves could be profitably turned into beef, and the heifer calves become in turn better cows than their dams. HOARD'S DAIRYMAN has shown by carefully compiled cow censuses that, in Iowa, as in Wisconsin, Indiana, Ohio, New York and other states, whatever claims may be made for her theoretically and in exceptional cases, the dual-purpose cow on the farm is always a delusion and not infrequently a robber. The cow that makes only 200 lbs. of butter in twelve months, is just about on the dead line, making neither profit nor loss for her owner. The average for all the cows in Iowa is considerably less than this. Why not then, by an intelligent system of breeding and weeding, get cows that will do better. There are plenty of examples in Iowa where the average yield of all the cows in the herd reaches 300 lbs. of butter per year, but this has not resulted from hap-hazard breeding or futile attempts to combine milk and meat potency in one animal.

Isn't it about time for the Iowa milk producer to look these facts squarely in the face.

The Wisconsin Feeding Stuffs Law.

Altogether too few Wisconsin dairy farmers know that we have a very stringent and effective law for protecting them from adulterated feeds. This law was passed in 1901 and provides that all feed stuffs sold in this state, (except hays and straws, the whole seeds and the unmixed meals made directly from the entire grains of wheat, rye, barley, oats, corn, buckwheat, dry or wet brewers grains, malt sprouts, sorghum and broom corn, pure brans and middlings), must be accompanied with a guaranty showing the amount of protein and fat they contain.

It is made the duty of the Experiment Station to analyze feeds and issue permits to the manufacturers to do business in Wisconsin, and at the meeting of the Wisconsin Dairymen's Association last February, Prof. Henry, in an address on this subject, under the sub-title, "How the Farmer May Post Himself on Feeding Stuffs", said:

First, every farmer should have his name on the mailing list of Wisconsin Experiment Station in order to receive its frequent bulletins. When about to purchase a feeding stuff of a new name or not well known, consult the last bulletin on feeding stuffs and see if it is licensed. *Remember that licensing does not indicate that the feeding stuff licensed has a high value.* It simply means that the dealers are complying with the law and the material comes up to guaranty, which may be a low one so far as real feeding value is concerned. Unless one is short of roughage, such as hay, straw or corn stalks, always purchase a feed with a high protein content, a fairly high fat content and a low percentage of crude fiber. Remember that the crude fiber is the woody part of the feeding stuff and not particularly valuable. In purchasing ground corn and oats, deal only with reliable people and see that there is no admixture, the material being just what it pretends to be, and that no light oats were used in producing the mixture. Better yet, buy pure grains ground separately, and do your own mixing. Where by-products containing oat hulls, etc., are purchased, never pay high prices for such material nor expect high returns from their use. As said in the beginning, they have a legitimate place among feeding stuffs, but oat hulls, oat dust, ground corn-cobs and ground corn stalks can never take the place of the richer parts of the flax seed, the bran and the middlings of the wheat grain, the rich grains of corn and the meats of the oat kernel. Avoid buying anything that is mysterious or carries a high-sounding name, just because it is a novelty. When you purchase a high grade feeding stuff be willing to pay a fair price for it, and for the cheaper portion of the ration with the heavy percentage of crude fiber, draw on the straw stack, the corn shock or the forage in the silo.

Value of Leguminous Crops.

ED. HOARD'S DAIRYMAN:—Although the system of green manuring or ploughing under green crops raised for that purpose, is one of the oldest means of improving the fertility of the soil, and although it was advocated by the Romans more than 2,000 years ago, it may not be unprofitable to again direct attention to the value of leguminous plants for green manuring and feeding.

From the expressions of opinion of those whose opinion is worthy of notice, the key note has always been that farmers generally should grow more leguminous crops, such, for instance, as clover, peas, beans, lupines, vetches, alfalfa, cow peas, etc, etc. These furnish the cheapest food for stock, and the cheapest manure for the soil; this they do because they obtain from the air a substance necessary for plants and animals alike, which costs, in the form of fertilizers and feeding stuffs from 15 to 25 cents per pound.

But although green manuring may be the cheapest means of supplying the soil with nitrogen, it must be remembered that animals, as well as plants require nitrogen for food. It may be estimated that by feeding the crops of clover, cow pea, etc., only one-fourth of the fertilizing materials of the crop is lost, if the manure is properly cared for. The nitrogen of the air, as well as being the cheapest source of nitrogen for plants, is also the cheapest source of protein (nitrogen) for animals.

The leguminous crop, therefore, is best utilized when it is fed out on the farm, and manure saved and applied to the soil, for by this method the greatest profit is secured, and nearly the same fertility is maintained as in green manuring. For renovating worn or barren soils, and for maintaining the fertility where the barnyard manure is not properly cared for, green manuring with such leguminous crops as cowpeas, clovers and lupines is very beneficial.

A dressing of potash and phosphates will be usually sufficient for the green manuring crops. But there is no doubt that green manuring on medium and better classes of soil is irrational and wasteful. The farmer should mend his system, so that the barnyard manure will be as well cared for as any other farm product, and loss from surface washing, leaching, fermentation and decay must be guarded against. By this means the feeding of richer foods, will mean richer manure and better and cheaper crops.

Then, again, leguminous crops which are extremely valuable in the system of soiling, or feeding crops in the barn in place of pasturage, enable a larger number of animals to be kept on a given area of land, and the manure to be more completely saved. Hay from leguminous crops has been found to be about twice as rich in protein as hay from grasses. In the one case this protein (nitrogen) is obtained very largely from the atmosphere; in the other, it is drawn from the fertility of the soil.

Leguminous crops yield larger crops of hay to the acre than grasses. Hence, the production of food materials on an acre, especially protein, is several times larger with leguminous crops. It has also been found that, if allowed to ripen, the seeds of the cow pea and soja beans, furnish an extremely rich, concentrated feed, which can be ground and fed in place of expensive commercial feeds. The straw remaining may be fed as coarse fodder, for it is richer than ordinary hay.

The following table may be of interest and instruction:

FERTILIZING INGREDIENTS IN 100 LBS. OF LEGUMINOUS CROPS.

	Moisture	*Nitrogen*	*Phosphoric Acid*	*Potassium Oxide*
	Lbs.	Lbs.	Lbs.	Lbs.
Red clover	80.00	0.53	0.13	0.46
White clover	81.00	0.59	0.20	0.24
Alsike clover	81.80	0.44	0.11	0.20
Alfalfa	75.30	0.72	0.13	0.56
Cow pea	78.81	0.27	0.10	0.31
Soja bean	73.20	0.26	0.15	0.23
Horse bean	74.71	0.68	0.33	1.37
White Lupine	85.35	0.44	0.35	1.73
Common vetch	84.50	0.59	1.19	0.70
Serradella	82.59	0.41	0.14	0.42

Green manuring on good soils can only be recommended when the conditions of farming do not admit of the careful preservation of manure. Leguminous crops are unusually rich in protein—far richer than most other coarse fodders. For instance, while hay from grasses contains from 6 to 8 per cent of protein, red clover hay contains 12.5 per cent, alfalfa hay, 14.3 per cent, and cow pea hay, 16.6 per cent of protein. If grass hay and corn are fed, such concentrated feeding stuffs as cotton seed meal, gluten meal, linseed meal, etc,, must be fed to make up the supply of protein needed. If leguminous crops are fed, much less grain will be required. The only true economy of material is obtained when the leguminous crop is fed. The carbohydrates and fat serve to nourish the animal, and a portion in turn passes into the barnyard manure, and when applied to the soil has a favorable effect on the humus formation.

A German authority on feeding and farm management has calculated the matter on a financial basis. Assuming an average crop of 17,600 lbs. of green serradella, which is a moderate crop, he finds the nitrogen in the crop from an acre to be worth $11.06. This is taken as the value of the crop for green manuring, as the nitrogen is the only fertilizing element not derived from the soil, and the barnyard manure furnishes nearly as much humus as green manuring. The estimated profit from feeding the crop of 17,600 lb. of green serradella to milch cows, when the barnyard manure is re-

turned to the soil, is $23.12. In this calculation, every possible expense attending the feeding is taken into account, including care of animals, interest on money, cost of carting the barnyard manure to the land,etc., and allowance is made for the phosphoric acid and potash sold in the milk. The comparison stands thus:

Profit from feeding crop of serradella 1 acre	$23.12
Value of crop of serradella 1 acre green manuring	$11.06
Difference	$12.06

This calculation, therefore, shows the crop of serradella to be more than twice as valuable for feeding as for green manuring. The above calculation assumed a daily milk yield of seven and a half quarts sold at 2¼ cents per quart.

Although the green manuring of light sandy soils with lupines is often of very great advantage in enriching the soil in humus, this advantage does not hold good in the case of better soils. Now the question is: Why should the farmer go on raising meadow hay as his main supply of coarse fodder, and buying grain to supplement it, when by growing leguminous crops, the nitrogen required by animals can be produced at the lowest cost.

The cultivation of these leguminous plants certainly involves somewhat more labor, as a rule, than raising grass hay, but the extra expense will prove profitable, for it enables the farmer to raise his own concentrated feed at the same time he raises his coarse fodder. It has been proved that soja bean meal is fully equal to cotton seed meal for milk and butter production.

This meal is one of the richest feeding stuffs, and the beans can be threshed out and ground, and the straw used as coarse fodder. This straw is richer in food materials than a good meadow hay. It may be said in general that 100 lbs. of hay from leguminous crops contains about twice as much protein as 100 lbs. from grasses. The leguminous hay may be safely estimated as worth from one-fourth to one-third more for feeding than common hay. It should be remembered that under favorable conditions, leguminous crops may draw a large proportion of nitrogen from the air, and that their long roots enable them to feed on the potash deep down in the soil, beyond the reach of surface feeding plants.

Montreal, Can. W. R. GILBERT.

Notes from New York.

Success as a Dairyman—Hired Men.

ED. HOARD'S DAIRYMAN:—Success, the one great object of life, demands the careful study and attention upon the part of the individual himself. Success as a dairyman requires no less a constant, ceaseless, watchful care on the part of every man connected with that particular branch of farm business and affairs; success means ambition, gumption, go-at-it-tiveness, if there could be such a word put together.

It means to the man who starts without capital that something will have to be done, that he can not spend his days in idleness, but with his sleeves rolled up and the sweat starting from every pore, strive to accomplish as much as possible. The cows cannot be milked, fed and cared for without putting forth some effort, yes, a whole lot of it and the more effort, the more success.

Now, I don't mean that one can do everything to the best advantage with just main strength and ignorance. No, you must have plans, harness the intellect, call on the brain to do its share of the work, in short, work intelligently from the cows, their feed, and care to the finished product you offer to the market in competition with others in your class. There are as many failures to complete success as there are individuals. Some fail in one essential, while some other man is all right in that part of the work, but fails at some other point before attaining success in its completeness. Now the ferreting out of that weak point in our several structures of success and remedying it, is where the intellect comes into action. There is where one tries his brain capacity and power. Many people seem to drift along through life, never seeming to have a care for tomorrow, unmindful of the result, what it will be. But I can't do it. I want success and must have it,—the success from a financial standpoint, based on honest, legitimate business principles. Neither am I afraid to work with brawn and brain to that end.

Every day a full day. Every day something actually accomplished to that end. Today success many times is a fine point. To discern the margin of profit in dairying requires a microscopic vision; but the man of gumption will soon find a means of placing the balance on the right side of the ledger. Push, Pluck and Perseverance win out every time. Give me the earnest man, the man who has success firmly fixed in mind and keeps his head clear.

I've no use for the one who is fickle minded and has spasms of gumption. The trouble is, the spasms are far between and the space between them gets farther as the years advance. It has been quite a few months since I have written anything for the farm papers because I have been taking large doses of my own medicine. I have been my own hired man this summer and therefore can, I think, have a word on that vexed problem.

I think the best result can be attained with hired help in treating them on a plane of equality. I am speaking of our own American help. We always use them as though they were one of the family. Counsel with them in the details of the work and let them have considerable of the success of the operations to their credit, and if there is a failure shoulder it myself and say nothing. A man cannot afford to have the ill will of the hired man.

Another thing, don't boss him every move. He will work better if he can do things his way, and as long as he does it quick and well what difference does it make to you. Don't destroy his own self esteem. Every man has more or less of that quality and when he is once shown that you have no regard for that quality in him, you have lost your man; he may stay but his interests in your work is gone and he might about as well go too. Let him have opinions of his own; don't argue with him, don't keep telling him that wages are too high. If you can't agree with him change the subject. Keep the good will of your hired help or don't keep them. I never had a poor hired man. If they didn't do their work good enough for me I always encouraged them to take more time and do a little better job if possible.

A clean looking tramp came to our place and asked for something to eat; it was in the early morning. I told him certainly, and he was given a chair and a seat at the table and a good cup of coffee together with a good square meal. I surprised him. After breakfast he said "I h'aint a dead beat, I would like to work for you to pay for that breakfast." I asked him if he would hoe for me a few days if I would pay him for it and he readily consented. I took him to the field and showed him a patch of mangels that needed hoeing and thinning, showed him what I wanted and left him with this injunction, "I am going to be away from home today so you will have to work alone and if you kill yourself at this job you will be to blame." One of the neighbors was in a field near at work and he said the fellow never looked up in all day; the result was I hired him longer, and through haying, and a better, more faithful fellow I never had around, but I never called him a tramp. I should have called him a trump if any thing.

New York. JAS. M. PLATO.

The Farm Horse.

[Synopsis of a Talk on the Farm Horse at a Farmers' Institute at Bainbridge, N. Y., by FRANK D. WARD, of Batavia, N. Y.]

I am glad to speak upon this subject, for it is a question in which all are interested.

Some people are preaching that we are coming to a horseless age. Now, our children and grandchildren will never see that time. It was prophesied that the trolley car and the bicycle would supercede the horse, but that time will never come. Neither will the automobile nor any other means of locomotion. No, the time will never come when the class of horses demanded in the best markets will not be grown with profit. Europeans are looking to this country for horses, for we can grow better horses than anywhere else, and while some other parts of our country can grow them equally well as we can here in New York, that territory is limited, and nowhere can they grow them better than here.

One of the greatest troubles with our breeders is, we have been breeding from unsound or vicious horses. The saying of Paul, "Whatsoever a man soweth that shall he reap," is as true to-day as when uttered, and nowhere is it more true than in the breeding of horses.

The different types of horses may be divided into four classes: The heavy draft horse, the heavy coach or carriage horse, the trotting horse and the general-purpose horse. And the successful breeder must hew close to the line and confine himself to one breed.

First as to the trotting horse, I wouldn't let a boy and a trotting bred colt grow upon the same farm, for I would expect it to prove the ruin of the boy, and between the boy and the horse I will take the boy every time. So we will cut the trotting horse right out of this question. The general-purpose horse, too, will not be found profitable, for the class commonly known as general-purpose horses, are too light for profit.

So we are now limited to the heavy draft horse, and the heavy coach and carriage horse. What shall we breed then? I think we will find every merit in heavy draft horses in three breeds: the Clydesdale, the Percheron and the Shire; and for coach horses, I would also confine myself to three breeds: the French coach, the Hackney, the German or Oldenberg coach. As to the weight of the former, I would have one weighing about 1,400 lbs., and in coach horses a weight of not less than 1,200 lbs. Some one will say these heavy horses cannot stand it to work on plowed ground or on the farm, but there was never a greater mistake.

Now, how shall we breed them, and what time of year? I believe with a spring colt, it is much better to keep the colt in a good box stall than to allow it to follow the mare when working her. But I believe though that fall bred colts are greatly preferable. The colt should be fed liberally and intelligently, and begin by feeding some grain when quite young. Feed at first with regular but moderate feedings of ground oats, some oil meal and a little bran.

The disposition in the dam is a question of great importance. A vicious, uncertain disposition in the dam will be transmitted to the offspring. Always halter break the colt while running with the dam, but never use a rope halter. Always use a good, five-ring leather halter. Handle always with the greatest care, never to frighten the colt with the harness. Never use a bitting rig of any kind on the colt. Never check up the colt until he has been taught to drive. Always hitch the colt up with a good, young, snappy, vigorous horse, but never hitch it with an old horse that will teach it to walk slowly. A colt will learn more mean tricks from some slow, old plug in a few days than it will forget in years.

Having bred a horse of this class then how shall we sell him? Why, we will not have to consider this question at all, for they will sell themselves. The man who will breed this kind of stock in any locality need never fear a lack of market, for the time will never come when such horses as these, if clean of limb, of good action and life will not be in demand, and that too, at profitable prices.

And also, these good horses will do better work upon the farm. They will, as I have already said, be found profitable for the market, and best of all they will make the farm work more pleasant, and thus, as you will find, will have an influence in keeping the boys contented on the farm.

Now for the dairy farmer in New York, Wisconsin, or any other section equally well adapted to the growth of this class of strong, vigorous and hardy horses I have indicated, who is looking about for some profitable adjunct upon his dairy farm to add to the resources, I believe horse breeding, if intelligently directed, offers better advantages today than almost any other line of work.

Delhi, N. Y. E. J. BROWNELL.

Reading Helped to Make the Herd Profitable.

ED. HOARD'S DAIRYMAN:—I find both pleasure and profit in the DAIRYMAN; where three years ago my cows did not pay their keeping, now, thanks to the teachings of the DAIRYMAN, they are returning me a satisfactory profit. For the past year I have sold over one thousand dollars worth of butter from a herd of fifteen cows—$70 per cow on an average—besides supplying our house wants. I count the cost of keeping cows thirty dollars per year. I raise nearly all I feed and count the selling value when harvested. Two-thirds of my herd are under four years old at this time, two of them under two years, dropped calves at fifteen and sixteen months old.

Good cows, suitable environment and the right kind of a man behind the cow makes dairying pay in the Palouse country. For more than two years I have weighed and recorded the weight of each cow's milk every milking and know that it pays to do so. I also use the Babcock test. My cows are mostly Jersey grades of my own raising. Where can I obtain blanks for recording weights of milk?

Moscow, Ida. H. L. C.

The blanks can be obtained from this office at the following rates:

10 Cows.	*1 Cow.*
1 for 5 cents.	5 for 15 cents.
6 " 20 "	10 " 25 "
12 " 30 "	25 " 50 "
25 " 50 "	

United States Dairy Statistics.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain sepecific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

A Washington Ration.

Being new in the dairy business and desiring to get the most out of my cows without hurting them, will you kindly give ration for a mixed herd of cows. Alfalfa hay; bran, $20; shorts, $21; oil cake meal, $29; middlings, $27; dairy chopped feed, $20; sprouts 25 cents sack.

I am retailing milk in the city of Seattle.

Seattle, Wash. M. J. L.

Alfalfa hay being a highly nitrogenous feed stuff, we ought to have the grain part of the ration incline strongly to carbohydrates. The wheat shorts, if it really is what its name imports, would be the most suitable and cheapest. The amount to be fed daily must be governed wholly by circumstances. One may safely feed as much as 10 to 12 lbs. daily, but it is exceedingly doubtful whether it would prove profitable. The probability is that an average for the herd of 20 lbs. alfalfa hay and 6 lbs. of shorts would be ample. This would allow 8 lbs. of shorts to the heaviest milkers and 4 or less to strippers and others without ability to respond.

Potatoes.

Are potatoes injurious to a milch cow, that is, to feed them say, a half a gallon of fine cut potatoes at a feed twice a day? And how is the best way to feed them, cooked or raw, to get the best results? T. D.

Soledad, Cal.

Potatoes in moderate amounts are not only not injurious, but under many conditions, beneficial to milch cows. They may be fed up to 15 to 20 lbs. per day, and should not be cooked.

A Maryland Ration.

Kindly suggest the most advantageous ration for 800 lb. to 1000 lb. cows, Ayrshires and Jerseys mixed, about half blood of each. I have well eared, corn ensilage, timothy hay, $12 per ton; ground corn and cob corn, 50 cts. per bu; dried brewers grain, $16 per ton; bran $19; object the most 4½ per cent, entire milk for the Baltimore market. C. G. E.
Parkton Md.

Subject to modifications noted in our revised feeding standards on page 1014 we suggest as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
40 lbs. silage	10.56	.52	5.60	.28
6 lbs hay	5 21	.17	2.60	.08
5 lbs dried grains	4 59	.79	1.82	.26
3 lbs. corn and corn meal	2.67	.19	1.89	.11
Totals	23.03	1.67	11.91	.73

The per cent of fat in the milk will be governed by the individuality of the cows and not by the feed given them. See that they have salt every day.

Feeding Value of Sugar Beets.

Of what value are sugar beets for feeding, compared with bean and ground oats? Would you consider them of more value for fat than for milk. O. J. R.
Elroy, Wis.

Sugar beets carry 11.5 per cent of digestible nutrients, and bran 58 per cent. Bran is therefore worth five times as much as sugar beets, except that in the absence of silage, the beets afford succulence, which is a decided benefit, but one that cannot well be measured in money.

A New York Ration.

Please give me a ration from the following; Cows are giving now about 22 lbs. milk a day. Ensilage, mixed hay, $10 to $12; wheat middlings, $21; wheat bran, $20; Ajax flakes (distillers grains) 34% protein, 12% fat, $25.50; H.O. dairy feed, gluten feed, oat refuse 18% protein $26. A. A.
Darien, N. Y.

If practicable, let these cows have 40 lbs. of silage daily and all the hay they will eat with good relish and without waste, and 4 to 6 lbs. equal parts of the Ajax flakes and gluten feed, with a large teaspoonful of salt, morning and night

Pure Breds.—Cross Breds.—Grades.

As I have been somewhat confused by the terms pure bred, cross bred, grade, scrub, etc., as applied to cattle, will you kindly give me some information on the following questions:
1. What is the difference betwen a pure bred bull and a registered bull?
2. What is a grade bull?
3. What is the "social status" of the offspring of a pure bred bull and a grade cow?
4. If a Jersey cow be put to a Holstein bull, each being pure bred, and the offspring, if a heifer, subsequently put to another bull, what would the calf be if the second bull were: (a) a pure bred Holstein, (b) a grade Holstein, (c) a pure bred Durham, (d) a grade Durham?
Abbottsford, B. C, W, A. C.

1. The difference between a pure bred bull and a registered bull is simply a matter of evidence. The latter has his name and breeding registered, that is, recorded in the books of the cattle association of the breed to which he belongs, while the former is a waif without any recorded evidence as to his sire or dam.
2. A grade is an animal with a registered sire or dam, the other parent being without registered evidence as to breeding, usually a native or another grade.
3. A grade.
4. (a) Cross bred; (b) (c) and (d) grades. The term "cross-bred" is reserved for the offspring of pure bred sires and dams.

A Wisconsin Ration.

Please formulate me a ration for my milk cows from the following feeds: Shock corn, plenty of fine corn fodder, oats, mixed timothy and clover hay, mostly clover.
Corn, $10 per ton; oats, 31 cents per bushel; bran, $17 per ton. A. P.
Brooklyn, Wis,

It is very evident that oats are not as cheap as bran or corn, and with mostly clover hay and shock corn for roughage, we should be disposed to rely upon the bran exclusively for the additional protein required.

How much bran? Information as to the kind of cows, their condition as to lactation, when expected to freshen again being withheld we have no basis for making an estimate. A careful perusal of answers given to other inquirers will give some indication as to the general course we would pursue.

A New York Ration.

Is this ration right? Ajax flakes (which is a distillers' feed), I mixed 100 lbs. and wheat middlings 100 lbs, The Ajax flakes were guaranteed protein, 34 per cent, and cost $25.25, and the middlings 19 per cent, cost me $21.00 I feed ten quarts or seven quarts every day to each cow with silage and hay. Gluten feed is 26 per cent protein, and costs me $25, Shall I use this or the other? C. H.
East Aurora, N. Y.

As we have no means of ascertaining how much a quart of the mixture above described weighs, we cannot say whether our inquirer is feeding properly. We should consider 8 lbs. of the mixture daily all that would be necessary as a rule, and probably more than some of the cows could use with profit. If the "flakes" are prime in quality and palatable to the cows, we see no necessity for changing.

Using Bull in Tread Power.

I have a thoroughbred Holstein bull nearly two years old that I would like to use for running a churn and separator with a tread power. Would it be too much to have him on a power a few hours at a time?
Where could I get a good tread power? Will it run a separator regular enough? Would like to separate the milk of about 40 cows. The churn is a combined churn and worker.
Lewisburg, Penn.

There will be no necessity for keeping the bull in the tread power a "few hours at a time," but if it was no harm would result. The Senior Editor uses a bull for running a separator and has for some years. The only trouble is that the power furnished is more than is necessary. With a large bull it would be expedient to have a quick acting brake to control the motion.

The St. Albans Foundry and Machine Co. St. Albans, Vt. make single tread powers, and would advise corresponding with them.

A Wisconsin Ration.

Please formulate a balanced ration for my herd of 10 milch cows, weighing 1000 lbs. I have on hand good corn silage and plenty of well cured clover with some timothy hay and corn stover, which I run through the feed cutter. Cows were all fresh in October and November.
Bran, $18.00; linseed oil meal, $25.00; oats, 32c; wheat middlings, $18.00.
Am feeding at present, 40 lbs. silage, 15 lbs. hay, 4 lbs. bran, 2 lbs. oats and 1 lb. oil meal, with salt twice a day. Cows are giving twenty to thirty lbs. milk per day. Can I feed for better results? They have all the stover they will eat, without waste. W. P. K.
Weyauwega, Wis.

We do not undertand how these cows can be induced to eat so much roughage. Probably the amount of hay is over estimated. We should think that 40 lbs. silage, 10 lbs. hay, and grain as specified, would be ample for cows giving not more than 30 lbs. of 4 per cent milk. If corn stover takes the place of part of the hay, you might add another pound of oats to the heaviest milkers.

A Massachusetts Ration.

I have ensilage (not much corn in it) and mixed hay; am feeding 30 to 35 lbs. ensilage and all the hay the milking cows will eat. Can get grain at following prices. Please print ration for cows giving from 16 to 44 lbs. of milk a day. Biles four-ex, $28: gluten feed, $28; oil meal (old process), $30; cotton seed meal $31; middlings, $26; meal, $23; bran, $24. W. H. P.
Petersham, Mass.

Inasmuch as milk is a product manufactured from feed consumed by the cow, it is manifest that the cow yielding 44 lbs. of milk daily will require very much more raw material than one yielding only 16 lbs.; but not in the proportion of 44 to 16, because first of all the food of maintenance must be supplied, which will be practically the same whether the cow gives much or little milk. The quality of the milk is also an important factor in determining the amount of feed required. For example, 100 lbs. of 4 per cent milk, contains fully two pounds more milk solids, than 100 lbs. of 3 per cent milk, and these extra two pounds of milk solids must come from the feed, eaten and digested.

For the largest milkers we recommend not less than 10 lbs. of concentrates, of which 2 lbs. may be cotton seed meal and 4 lbs. of the Biles grains (or gluten feed) and 4 lbs. bran.

Plan for Manure Shed.

Please send me a plan of a manure shed to contain the manure of fifty head of cows for six months. The same to be spread with a manure spreader in the fall. J. B. W.
Cuyler, N. Y.

As we have never had experience with manure sheds, we refer this inquiry to our readers for reply. We can plainly see that such a structure should have a slightly concave bottom and preferably covered with a durable cement lining.

From the Ex-Hired Man.

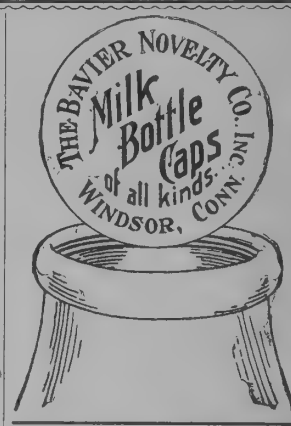
ED. HOARD'S DAIRYMAN:—Granting that I am the gumphead which one of the farmers from Wisconsin calls me, I can now earn from $20 to $25 per month and board. I wonder how much more I could earn working out for any farmer who manages his own farm, had I all the wisdom of a Solomon or even of this Wisconsin farmer.

What I tried to make plain in my former letter and what I still say is, that intelligence and education and even experience above a certain small amount are of no value, pecuniarily, to the average single hired man so long as he remains a hired man.

Somebody, somewhere, has said something like this: "Men are paid for what they can do, not for what they know; but what they can do is limited by what they know." I wonder if this is true on the farm. Is the hired man any more able because he has knowledge and experience and brains? If so, why doesn't the educated and experienced farm hand command more wages than the novice? He certainly doesn't.

We farmers, (I am a farmer myself, in heart, if not in fact) are about as consistent as the religious man I know who leaves all the Sunday chores for the hired man to do while he goes to church and prayer meeting. Then, when his man leaves, he wonders how he has so much trouble keeping help. We farmers pay taxes and scrimp and save to give our boys a high school and perhaps a college education. When they graduate they can get from 50 to 100 per cent more as a clerk or bookkeeper than can the non-educated boy of the same age, but not one cent more on the farm. Then we wonder why the boy doesn't stay on the farm. Wouldn't he be a gumphead if he did?

Now, about the farm hand being out late nights. In all too many homes the hired man is treated only as a necessary part of the farm and domestic machinery. He is given a place to sleep and three good square meals, but no place in the family circle. What wonder then, that homesick and longing for congenial society, he spends most of his spare time running around and trying to get a little pleasure out of life.



I don't say that the hired man isn't to blame for his condition. Perhaps he is to blame in the first place for being a hired man, but honestly, I don't see how the hired man working for the average American farmer can be very much different than what he is today. You educate him, and in a few years at least, if he isn't a gumphead, you lose him.
Bath, N. H. AN EX-HIRED MAN.

Smoothing Harrow for Corn.

ED. HOARD'S DAIRYMAN:—Answer to T. R. W., on page 997, Dec. 11. I have used smoothing harrow to good advantage on ground free from stone and rubbish, when corn was 1 to 2 inches high, and on stony ground, when the corn had sprouted ½ to 1 inch (corn planted 2½ to 3 inches deep). As the weather may not permit of this, I cultivate 6 to 10 days before planting, and then shallow just before planting, this kills many of the weeds. N. K. S
Pottstown, Pa.

ED. HOARD'S DAIRYMAN:—I saw an article on cultivating corn with a smoothing harrow by T. R. W. As I have had some experience in tending corn in this way for a number of years, and on different ground, I would like to give my opinion on the subject. It won't do to harrow corn when it is ½ to 1 inch high, because it is too tender when it is just through the ground, but it is all right to harrow it after it is 2 inches high if the ground is clean from trash, such as corn stalks, straw or anything that will be caught by the harrow and be dragged a ways, as this would destroy some of it if it happened to be on the row. But if the ound is properly plowed and harrowed

before planting and after, so that there are no clods to bother the young corn it will work well. If the ground is cloddy a roller or plank should be used to crush the clods.

I drill my corn in rows and try to get it 6 to 8 inches apart, 1 kernel in a place. After harrowing it 2 or 3 times, then I plow it with a disk cultivator, with it set so that the inside disks throw the dirt away from the row and the two outside disks throw the dirt to the row so as to more than fill the furrow made by the head disk.

When this is done I harrow it, cross the rows, letting the harrow lap half, but do not harrow the corn early in the morning. The corn will stand it better, and you will kill more weeds after the sun gets hot, from 9:30 till night. Then two good plowings with the disk cultivator will insure a perfectly clean field.

This will leave the field somewhat ridged and the corn is well hilled up, but this is so much the better, it will stand hard winds better, and a fine, well pulverized surface will draw and hold moisture in a dry season. The corn being in the ridges will run the water away from the corn in a wet season, so it is better for this, than if small grain is put on this ground. The next year sow it broadcast, then use a spring tooth harrow, disk or a spading harrow. I prefer the spader because it will work in all kinds of ground and do better work. Always drive diagonal of field so as to level the ground. Then harrow with a smoothing harrow.

Worthington, Minn. F. A. L.

Vealing Calves With Skim Milk and Flour.—A Fifteen-year-old Silo. —Experience With Silage.

ED. HOARD'S DAIRYMAN:—Enclosed please find one dollar to renew my subscription. I think it well worth the money. I read an item in the DAIRYMAN last spring about feeding flour in the skim milk to young calves, that has been worth a year's subscription to me.

I use a hand separator and veal my calves on fresh skim milk, and by mixing a handful of cheap flour with each feed of milk the calves do first rate, but care must be taken not to overfeed.

Some silo experience: I have a square silo, 19×22 feet and 23 feet deep, with partition, which has been in use 15 years. It began to give out two years ago so silage spoiled a considerable. Last year we lined the worst places with tarred paper put on perpendicular; also lined the doors with paper. and the silage kept as well, if not better, than it ever did.

I have had considerable experience feeding ensilage and I don't think the grain in the silage is equal to dry corn.

Green Lake Co., Wis. CLARK PAGE.

Feeding a Milkman's Cows.

ED. HOARD'S DAIRYMAN:—I will give you an answer to feeding a milkman's cows in paper of Dec. 11. Take 700 lbs. of winter bran, 100 lbs. cotton seed meal, 100 lbs. of corn meal, 100 lbs. of oil meal, 100 lbs. of gluten meal; mix thoroughly on the floor and you will find it will weigh about one pound to the quart and feed from 4 to 6 quarts at a feed night and morning, in dry form, to cows that have been in milk for four weeks and longer. To cows just after calving, give warm bran gruel for nine days. After nine days take half of the mixture named above and as much bran and mix together, and after 4 weeks leave out the bran a little at a time, and put in the mixture in place of it until you have them on the regular feed of the mixed grain. Feed grain dry with a little fine salt in each feed.

Brockton, Mass. M. C. S.

Erecting a Stave Silo.

ED. HOARD'S DAIRYMAN:—Your illustrations of silo construction, on first page of last week's DAIRYMAN, by N. H. C., shows the construction of a round silo, 2x6's. This is a form of silo used by myself for 5 years and paid for itself five times over, now sold to a neighbor and moved and set up by us. By reason of our moving next spring to a larger farm (420 acres) we can not use so many (three) silos, as we had on our 100 acre place.

We made a concrete foundation, circular, one foot above ground, the lumber was tarred and left to dry while we built foundation. We then made the continuous doorway and stood in position, bracing both ways with 2x6's as shown in cut 1; as 2x6's were used instead of 2x4's, we could not spike through one edgeways into the other, so put up a section of the top hoop to hold them from falling out as we toe-nailed them together.

As the lumber was rotted somewhat at the bottom, by reason of sawdust and manure piled up against it, we turned it upside down, piece by piece as put up, this accounts for the ragged appearance of the top.

By using ladders on the inside, we avoided the necessity of building scaffolding, which would take so much time. After the first section was nailed up, we set up another 4x6, braced it both ways and put up another top hoop section, when photo number two was taken. This section was nailed up and also the third section in the same manner. Then the hoops were put on, beginning at the bottom and working up.

This I think is the best way to erect a silo of 2x6's, but it is much better to build of 2x4's and spike together edgeways, (Buff Jersey plan) it is easier and quicker built, stronger, and kept in shape much better. F. M. PARSONS,

Illinois.

Corn Stalk Disease.

ED. HOARD'S DAIRYMAN:—We have been farming aud raising stock for the last six years, and have always let the cattle feed in the stalk fields in the fall and never lost any until this week when two cows died.

From reading a piece in the DAIRYMAN of Dec. 6, 1901, I believe they had "corn stalk disease." Is there any cure when they have it?

In the piece I have mentioned I find a sentence I do not understand. "After one outbreak has occurred, it is rarely the case that a second will follow." Does that mean for that year, or that herd?

There was some corn left in the field. Would the symptoms be the the same if the animal had eaten too much corn?

There was some smut in the corn. Would eating that cause the "corn stalk disease?"

Would horses be affected? Several have been feeding with the stock.

Mandan, N. Dak. R. S. V.

Veterinarians are not yet certain whether the so-called "corn stalk disease" is caused by simply over-eating of the dry and largely indigestible corn stalks or whether under peculiar conditions some poison is produced in the stalks, but they seem to be agreed that there is no effective medicinal treatment. Corn smut will not produce the disease. Prevention is the only remedy. Cattle should not be turned into stalk fields when they have empty stomachs and are ravenously hungry, and for the first few days for no more than an hour a day.

We have not heard of any fatality among horses, but it would be no more than prudent to pursue the same course with them as with cattle when first turning into stalk fields.

We understand the sentence quoted to mean that a second attack is unlikely in one season.

ON THE BABY

Coffee Even the Babies Thrive On

The little daughter of a College President was saved by the use of Postum Food Coffee at a time when she could not take any solid food.

Baby's aunt says: "My sister and her husband (who is President of a College in Georgia) visited me last Christmas and their little baby two months old was very sick. I thought it was not properly nourished so I began feeding it on Postum which I have used in my own home for years with such grand results.

"You would be surprised to know how that little thing improved. Sister had been feeding it on artifical food that did not agree with it. The baby continued to get stronger all the time we were feeding her on Postum and when sister left here she took Postum with her for she feels certain that with Postum to feed the baby on she is sure of good healthy nourishing food drink." Name given by Postum Co., Battle Creek, Mich.

Postum is made of the purest Cereals with absolutely no medication whatever and when boiled according to directions it is heavy with food value and a great nourisher and rebuilder as well as a delicious drink. It is also a specific for all of the dozens of different diseases caused by coffee. Trial proves this.

Look in each package for a copy of the famous little book, "The Road to Wellville."

The Whey Butter Question.

ED. HOARD'S DAIRYMAN:—The proposition to tax whey butter containing more than 16% moisture as an adulterated product at the rate of 10 cents per pound, amounts to taxing out of existence a most wholesome, valuable and cheap article of food, a food that is not an artificial product, nor an adulterated one, no matter if it contains 16 or more per cent of moisture.

The law under which it is proposed to rule this food out of existence, has relation to, and was expressly framed, against artificial or adulterated products. It provides in express terms that butter which contains any foreign substance whereby it is enabled to absorb more moisture than is natural (exceeding 16%), shall be subject to a tax of 10 cents a lb. as artificial, adulterated or renovated butter.

Whey butter is in no sense other than a natural product. It is just as much a natural product of the whey of certain kinds of cheese as is the cheese itself, or the milk sugar made from such whey. It is not a table butter. It is never sold by the makers for anything else but whey butter, whatever may be done with it afterwards Even a very poor judge of butter could not be deceived.

Its manufacture and sale has been honest and open. It was offered and sold as whey butter, never as butter, for centuries in Europe and for fifty years in Wisconsin. Its use is mainly in fine cooking, baking and confectionery, and for such purposes it is superior to lard or any other fat or oil, giving to the food prepared with it a fine creamy flavor all its own, especially if before it is used it has been melted, skimmed and again cooled. It is a favorite with all who have once used it, for there is no taint or suspicion of filth, cholera or scrofula attached to it.

It is usually sold at about one-half the price of creamery butter. Its production is confined to the sections of the country where sweet curd cheese is produced, mainly the Swiss variety. The high temperature at which this cheese is cooked and the absence of acid formation in the whey causes it to retain from ½ to one per cent of cream. This cream or fat, by a well known process, is separated and churned, and the result is whey butter. To tax such a wholesome and cheap food out of existence by means of a law aimed at adulterations and unwholesome mixtures would be a gross perversion of its intent and a wrong to producer and consumer. JOHN LUCHSINGER.

Monroe, Wis.

Our Special Elgin Letter.

For Committee of Arbitration—C. S. Kilbourne, A. Nolting, F. B. Cornell, J. P. Younger, D. C. Woolverton.

For Committee of Appeal—C. H. Potter, G. F. Oatman, T. W. Brennan.

Elgin, Ill, Dec. 21. H. C. B.

Dehorning Calves.

ED. HOARD'S DAIRYMAN:— -One morning as the class in Feeding and Stable management, were finishing their work, their attention was attracted by the Professor calling out "We have two calves that ought to be dehorned this morning. Are there any of you men who wish to experiment on them? How about you Mr. S." "Yes sir, I should like to," answered that gentleman, and the calf being produced and thrown in front of the window, in order to get the best light, the operation was begun by cutting all the hair very closely near the protuberance, and then wetting the spot where the horn would naturally come through. A stick of caustic potash was next dipped into the water and rubbed on the wetted spot until the skin loosened.

"When should a calf be dehorned, Professor?" asked a student. "After it is two weeks, and before it is three weeks old," was the answer. "Turn him over and operate as before," was the order next given. A student wished to know if that was all there was to it, and was answered that that was all there was necessary to kill the horn. E. K. MORSE,

Sanitary Manager of Cornell Dairy.

The Kansas State Dairy Association.

ED. HOARD'S DAIRYMAN:—The fifteenth annual meeting of the Kansas State Dairy Association will be held at Topeka, Kansas, January 26th, 27th and 28th, T. A. Borman, 1109 Throop St., Topeka, Kansas, Secretary; Geo. H. Littlefield, Parsons, Kansas, President.

Of Interest to Farmers.

Cultivating Corn with the Smoothing Harrow.

ED. HOARD'S DAIRYMAN:—T. R. W., of St. Albans. Vt., inquires through the DAIRYMAN for Dec. 11, as to the experience of farmers in relation to the early cultivation of corn with what is termed a smoothing harrow, and if it is a safe and economical process.

These harrows were in use to quite an extent a considerable number of years ago in this state for light, smooth work and the cultivation of corn in the early stages of growth, but later on the implement known as the "weeder," largely took its place in the corn field, and where rightly used, with good results.

Some years ago the smoothing harrow was used to a good purpose on my own corn.

But a few things are essential for the best success with either of these implements in the corn fields.

First, the land should be free from any obstructions, such as stones, strawy manure or loose sods, that might be dragged along and cover the corn in its small growth.

The corn should always be planted with a machine that leaves the hills or drills somewhat depressed, that is, a little lower than the surface of the ground. This prevents the harrow from tearing out the hills of corn, which it would be pretty apt to do if raised above the surface.

It is very essential also that the smoothing harrow or weeder be brought into use quite early. Do not even wait for the corn to get above the ground.

By using it before, the soil will have no time to become compact or hard, and the weeds or grass will be kept from getting a start. That should be the aim, for if the work is delayed until the soil becomes hard, or the weeds get well started, it will be difficult making a succses with this method of cultivation.

Go between the rows and after covering the field, if necessary turn about and harrow the second time, as this will render the work doubly effective and much ground can be gone over in a day.

The corn may get bent over some and look a little bad perhaps, at the first, but it will soon straighten up again all right and grow all the better for this thorough treatment. Very little will be torn up. Now and then a hill may be covered, and it might be well to pass over the field and make all right. No fear need be entertained of permanent injury, if the work is properly performed, and it will be a surprise to note how thriftily the corn will grow after such effective treatment, and how clean the ground will be. This will make a good begining and the after cultivation with some other implement will be necessary and satisfactory, that is, after the corn becomes too large for the smoothing harrow.

The implement I used was the Thomas smoothing harrow, the first of the kind to be used for this purpose. The numerous small round teeth had a bent backward slant of 45 degrees and worked nicely.

A PROFITABLE CROP OF ENSILAGE CORN AND HOW IT WAS GROWN.

A young farmer living in the town of Enosburg, raised a most satisfactory crop of ensilage corn the past season which was not very favorable for this purpose.

Four acres, probably, greensward, were heavily manured and plowed under. After the field was properly prepared it was planted with what is known as Mastodon corn, a large variety and which, under favorable conditions, ears well. Three hundred pounds of phosphate were used in the hill.

The early cultivation of this crop was with the weeder. With this he went

crosswise of the rows. This continued, resulted in the most thorough stirring up of the soil, no part escaping, and the growth was rapid and strong. This implement was used until the corn was too large for the purpose, then another kind of cultivator completed the work. The result was a heavy crop of corn. The phosphate in the hill gave it a quick, early start and when the roots reached the manure and decaying sod, enough nutriment was added, along with the thorough cultivation to assure the best results. Some of the stalks were fifteen feet in height and quite a proportion of them had two ears. From this crop of four acres, a silo 12x16, and 23 feet deep was filled. This would mean about double the average crop and shows what can be done in this line, when the conditions are the best, even in a latitude so far north.

Cheese—Receipts, 5,107 pkgs; quiet; state full cream, fancy, small, colored, September, 12c; late made, 10c; small, white, 12c; late made, 10c; large, colored, September, 12c; late made, 10c; large, white September, 12c; late made, 10c.

Eggs—Receipts, 3,329 pkgs; strong; state and Pennsylvania, nearby, average finest, 36c; state and Pennsylvania, seconds to firsts, 30@34c; western firsts, 36c; western seconds to firsts, 30@34c; refrigerated, 26@28c.

NEW YORK MARKET.

NEW YORK, Dec. 19—Butter—Receipts for the week, 28,962 packages. Exports for the week, 885 packages.

Our market dropped two cents per pound on extra fresh creamery butter, and has been dull and out of joint all the week. The supply of strictly fancy fresh butter is not excessive, and sold well to best grocery trade at top prices, but most of the creameries arriving are more or less off in quality and to move them, receivers are willing to cut prices 3 to 4 cents per pound. At the close there is more or less stock of this kind in every store.

There was some business reported in best June creameries, one long line selling at about 19 cents, and several lots of 50 to 100 tubs each at 20 to 21½ cents, and there are many anxious holders hoping for more demand even at low prices. Low grade butters are in full supply and sell slowly at prices always favoring the buyer, We quote:

Creamery, fresh, extra, 22@23c; medium, 20@22c; poor, 15@19c; creamery, June extra, 21c; medium, 18@20c; poor, 15@17c; Dairy, extra, 20c; medium, 17@19c; poor, 14@15c.

Cheese—Receipts for the week, 18,013 boxes. Exports for the week, 5,927 boxes.

Dull trade is reported from all quarters and will contiuue so until after the New Year. Exporters took some late make full cream and skimmed cheese at low prices. We quote:

Full cream, extra, 12c; medium, 10@11½c; poor, 6@9c.

Eggs—Receipts for the week, 20,381 cases.

Receipts quite moderate, but trade is light and prices very sensitive. We quote:

New York & Pennsylvania, fancy, per doz., 35@36c; Northern & Western, fancy, 35@36c; all sections, poor to good, 22@33c. refrigerator poor to good, 22@28c.

BALTIMORE MARKET.

BALTIMORE, Dec 17.—Butter—The receipts of extras, though rather light, are about equal the present requirements, as the prevailing prices have had a tendency to retard the demand to some extent. Firsts and seconds have been in fair request. There is also a good demand for choice to fancy grades of storage creamery when they can be bought under the price of current receipts. There is quite a scarcity of choice imatition creamery. Good to choice fresh ladles are in moderate supply and good demand, while held is in ample supply and slow sale. Roll—While there is some little increase in the receipts the supply of desirable is insufficient to satisfy the demand. Packing stock, when fresh and sweet, is in fair demand. Blocks and prints—All choice to fancy lots meet quick sale. The general market closes steady and firm on all desirable stock.

Creamery separator, extras, 26c; firsts, 24½@25c; seconds, 20@23c: Held creamery, extra, 24c; firsts, 22@23c; seconds, 19@21; imitation creamery, extras, 20c; firsts, 18@19c; seconds, 14@16c, Iowa & N. W, Ladle, extras 16½c., firsts, 15@15½c; seconds; 13@14c; Ohio & Indiana Ladle, extras, 16c; firsts, 15c; seconds, 13@14c Roll Ohio, extras, 17c; firsts, 16c; seconds 13@14cRoll, W. Va., firsts, 16c; firsts, 15c; seconds, 13@14c. Ohio storepacked, extras,—firsts, 14c; seconds, 12@13c; W. Va, firsts, 14c; seconds, 12@13c. Creamery blocks (2lbs.) extras, 27@27½c; firsts, 25@26c; seconds, 22@24c. Creamery prints, (½ lbs.), extra, 28c; first, 26@27c; seconds, 22@24c; Md, Va. & Penna prints, extras, 26@27c; firsts, 23@25c; seconds 19@22c. Renovated butter, extras, 19c; firsts, 17@18c; seconds, 15@16c.

Eggs—We made mention in our last issue that the egg market was in better shape since that time owing to continued light receipts of choice fresh stock and a brisk demand, the market has developed a much firmer feeling, and prices have been advanced materially over last week's prices close, active, and firm at 33 cents.

301 Exchange Place.

SAN FRANCISCO MARKET.

SAN FRANCISCO, Dec. 21—Under the influence of liberal supplies and the cautious operations of buyers, the general market for butter continued on an easy basis yesterday. The principal trading of the day was the filling of small orders of the better grades of creamery for immediate consumptive needs and for the favored brands the top quotation was demanded. Large lines of good scoring butter were available, with 27c as the extreme, but buying was small and indifferent. The stock from nearby producing sections is steadily improving in quality and having a weakening effect on values for some of the brands that have been in favor for some time past. Holdings of the medium and lower grades of butter were heavy, and sellers were unable to force sales, although willing to accept marked concessions. Supplies of eggs were heavier and the market displayed an easier undertone. For fine selected ranch the maximum quotation was still demanded in small ways, but buyers of round lots had little difficulty in filling their wants, with 48c as the extreme. Cheese was in liberal supply and easy at former rates.

Receipts yesterday aggregated 34,300 pounds butter, 705 cases eggs and 4,100 pounds of cheese.

Butter—Creamery, extras, 28c; good to fancy, 25@27c; dairy, extras, 23@24c; dairy, choice, 20@22c; store, 18@19c; California storage, 24@27c, eastern creamery, 23@25c.

Eggs—Ranch, selected large, 50c; good to choice, 45@48c; store, nominal; California storage, 28@32½c; eastern, 25@30.

Cheese—California creamery, mild, new, extra, 14@15c; mild, new, choice, 13½@14c: Young America, 14@15½c; eastern, New York, Cream, Cheddars and Flats, new, 14½@16c.

READING NOTICES

All Reading Notices under this head are at the rate of 25 cents per line.

Do You Want—A Hay Fork Returner? Every farmer having a barn should have one. A hummer for agents. Circulars free. ROONEY RETURNER CO., Box D, Independence, Ia. 50-tf

My Barred Rocks are hard to beat. 75 ckrls., 50 pullets, $1 to $5 each; 12 hens and cock, $10. W. E. SNAVELY, Hudson, Ill.

For Sale—De Laval Cream Separator; capacity 650 lbs., turbine, good as new. A bargain. E. F. BARKER, Franklin, Ind.

Wanted—Immediately, thirty-five high grade five and six-year-old Guernsey cows, preferably fresh or springers. Also a few strictly choice pure blood registered cows and heifers. X. Z., care Hoard's Dairyman.

"Little Giant" Cream Separator in running order, cap. 80 gal., run by steam. Also a new 6 bottle tester to exchange for Jersey, or offers. W. E. SNAVELY, Hudson, Ill.

The Third Revised Edition of Buff Jersey's Popular Book Just Out of Press—Ten chapters, 25 illustrations and right up-to-date. Subjects treated are: Silos and Ensilage, All Phases of the Dairy Subject, Soil Crops, Up-to-date Farm Machinery, How to Cure Abortion and Milk Fever, Some Medicines and Remedies, The Steam Plant, its care, and many other valuabe things ably treated. Send for circular. Sent post paid, cloth binding $1.00, paper 75c. BUFF JERSEY, Monmouth, Ill. 47-tf

For Sale—Two registered yearling Guernsey bulls. RAY BICKNELL, Ft. Atkinson, Wis. 32-tf

For Sale—Registered Ayrshire cattle, all ages, milking qualities unexcelled. Special prices on bull calves, 2 weeks to 9 months old, from grand cows. F. D. STOWELL, Black Creek, N. Y. 43-4

Jersey Bull For Sale—Dam's recorded test is 17 lbs. 4½ ozs. He is a grandson of Landseer's Fancy 29 lbs. ½ oz. in 7 days, 936 lbs. in 1 year. Has won four 1st premiums. Write for description and price. Also two half grown Collies. J. BLACK, Bremen, O. 42-tf

Wanted—Position by a butter and cheese maker with 23 years experience in business. Never drink or gamble. Married and has one son. Address A. W. N., 679 Arkwright street, St. Paul, Minn.

For Sale—Two De Laval Separators, 1000 lbs. capacity; No. 3 Hand and Dairy Turbine; 1 Four-Horse Engine and Boiler; 90 gal. Barrel Churn; 12-bottle Babcock Test; Big Ice Box; 2 Scales; Plumbing Tools; several Milk Cans; 1 Dairy Wagon and Harness; 1 Reed Butter Worker, and an Office Desk. Will sell together or separate. All the above practically new and in good condition. Address LOCK BOX 212, Carmel, Indiania.

Wanted—Position by butter-maker at once; preferably in Iowa or Ill. Have had fifteen years experience. Can give references. E. L. BEERS, Epworth, Iowa.

For Sale—One Low-Down Milk Wagon; one De Laval Hand Separator; one Star Milk Cooler. All as good as new. Will exchange for registered Guernsey heifers or good work horses. J. R. HUSTON, Dayton, Ohio. 46-4

Guernsey Cattle—All ages, both sexes for sale. Cir. free. CLOVER KNOLL GUERNSEY HERD, Orangeville, Pa. M. Sager, Supt. 41-tf

For Sale or Rent—Dairy farm of 200 acres, 90 improved. $1.50 per hundred for milk year around. Address J. P. SOUTHARD, Harbor Springs, Mich. 42-10

For Sale—10 cheese factories, 5 farms 40 to 160 acres, saloon, dance hall and store. FRED HADLER, 775 Ida St., Appleton, Wis. 43-tf

For Sale—Four officially tested Holstein cows, also two yearling bulls. Sire and dams, advance registry. FRANK BREWSTER, Bowers, Wis. 45-2

For Sale—Cheese factory, complete. M. S. MORSE, Williamsfield, Ohio. 45-4

Wanted—An experienced man, good milker and willing to work, on a dairy farm and other general work. GEO. A. STIVARIUS, Stitger, Wis. 45-2

Mr. Wheaton's Canadian Dairy Notes.

Dairying in Manitoba—Prince Edward's Island—Guelph Winter Fair—Canadian Holsteins—College Herd Record—Belleville Dairy Convention—Cheese Exports.

ED. HOARD'S DAIRYMAN:—In the Eastern portion of Manitoba, cattle raising and dairying largely take the place of grain growing. It is here that most of the dairy products of the province are produced and where wheat has to take a back seat.

1903 has been a very successful year in dairying. Though pastures were early, they were not of the best quality until June when the flow of milk reached its maximum. The dry weather towards the close of the season was somewhat of a drawback and the shortage of hay or rough feed may cause a falling off in winter production.

But in spite of these difficulties, the production of cheese shows an increase of 26 per cent over that of 1902, creamery butter 8 per cent and dairy butter 9 per cent. Cheese sold for 76 cents per hundred lbs., and dairy butter for 78c per 100 pounds more than in 1902, while creamery butter sold for 47 cents less than the average price of 1902.

There were manufactured during the season, 2,738,868 pounds of dairy butter, which sold for $15.70 per cwt., realizing $429,445; 1,532,835 pounds of creamery butter which sold for an average price of $18.13 per cwt., realizing $277,901; 1,382,304 pounds of cheese which averaged $10.95 per cwt., realizing $151,362. The total value of the dairy products of the province for the season of 1903 was $858,708.

While the total value of the dairy products of the province, including both butter and cheese, will not equal that of some of the counties of Ontario in cheese production alone, it is satisfactory to know that progress is being made. A 26 per cent increase is a pretty big one in a year's time and indicates that Ontario's big industry has obtained a pretty strong foothold in the wheat growing west. A year or two ago it was stated by those who professed to know, that cheese production would soon cease in the west and that dairying would be confined almost entirely to butter production. But it would seem from the above that cheese making had taken on a new lease of life.

Considering the distances farmers are apart and other conditions peculiar to the prairie province, it would seem as if butter making could be operated with greater success than cheese making. The farm separator system would seem to be specially suited to western conditions. The distances are so great that the hauling of the whole milk to a cheese factory or separator creamery would prove a costly process. But by each farmer separating his own milk and sending only the cream to the factory, the cost of hauling can be reduced almost to a minimum. This system is practiced almost entirely in the government creameries in the Territories, and has proven most successful.

Unlike Manitoba, Prince Edward Island, away down by the sea is going behind in cheese production. That province is not producing as much cheese as it did last year or the year before. And this in spite of the more favorable prices of 1903.

Why there is this decrease in production is not definitely stated by those in position to know. Activity in other branches may have something to do with it.

Last week the Provincial Winter Fair was held at Guelph. This is one of the most unique fairs of its kind on the continent. It is an educational fair, pure and simple. The animals shown, are there primarily for educational purposes. The visitor sees the animal on foot and if he waits long enough, will see the carcass of his own animal hung up in the cooling room attached to the show building. And this is not all. The judges in making the awards give their reason for so doing. A large lecture-room is provided, where, morning, afternoon and night, lectures and demonstrations are given on the proper types of animals for fattening and for milking purposes and how to feed them to get the best returns. In short, the fair is a kind of school for farmers, where they can come and ask questions and receive instruction from experts as to the best way of carrying on stock raising of all kinds. Because of these strong educational features this fair in several points excels even the great Chicago International. While the fair itself is primarily a fat stock show, a well conducted dairy test is no small part of the educational attraction.

A 48 hour test was conducted this year in which 37 cows and heifers competed, representing all our leading dairy breeds, excepting Jerseys and Guernseys. The dairy show this year was exceptionally good. There were 10 pure bred Holsteins, 11 pure bred Ayrshires, 9 pure bred Short-horns and 7 grades. There was one cow in the test that has been present for seven years. She is a brindle, a fine type of a grade dairy cow, and has that quality of stick-to-a-tiveness that brings her up to the scratch every winter. Not only did she come herself this year, but she brought two daughters with her. She is certainly bringing her family up to correct habits of quantity and quality. A generation or two of cows with the exact, definite training that even two days every year in a milking test would give them, should prove a boon to the dairyman.

For several years the Holsteins have had things pretty much their own way in so far as the sweepstakes prizes were concerned. Last year a grade Holstein swept the boards. This year a complete change has resulted and an Ayrshire heads the list. She was a good type of cow, owned by H. and J. McKee, Norwich, Ont. During the 48 hours she gave 123.87 lbs. of milk with an average fat of 4 per cent. A Holstein cow, owned by James Rettie, also of Norwich, was second with a record of 116.21 lbs. of milk and 4.2 per cent of fat. A grade Holstein was third with a record of 106.88 lbs. of milk and 4.4 per cent of fat. The brindle cow referred to above was fourth with 107.01 lbs. of milk and 4.2 per cent of fat to her credit.

The Holsteins bred in Canada seem to be gradually coming up in the quality of their milk. One grade Holstein gave milk testing 4.8 per cent, or something near to the Jersey ideal in her first test, while a three-year-old, pure-bred Holstein went 4.5 per cent and gave 60 lbs. of milk a day. It would seem, however, as if this increase in fat percentage was obtained at the expense of the loss of the sweepstates. But this is only a surmise as other conditions likely intervened.

One-half day of the lectures during the show was given up to dairying, or more strictly speaking, to talk on the dairy cow. Henry Glendinning, of Manilla, Ont., discussed the feeding of the dairy cow.

An interesting talk was given by Prof. Dean on the value of keeping daily records of dairy herds. He advised a close study and a close watch of the individual cow in order to find out what she is doing. It is only by so doing that the dairyman can feed and care for his cows intelligently and make a profit out of the business of dairying.

To show the effect of a daily individual record upon a herd, Prof. Dean gave the production of the college herd for the past three years, which is as follows:

		Lbs. of milk.	Lbs. of butter.
1900	Largest yield	9477	391
	Lowest yield	4157	190
	Average yield	7179	310
1901	Largest yield	11379	437
	Lowest yield	4727	250
	Average yield	8114	326
1902	Largest yield	10795	461
	Lowest yield	3489	149
	Average yield	6673	289

According to this, 1902 was not as good a year for the college herd as 1901. The Professor, however, expects that the herd will have a better record to show for 1903. However, progress has been made. At the college a record has been kept of each cow in the dairy herd for the past thirteen years.

The essentials for making an individual daily record of a herd, as given by Prof. Dean are; 1. Have a name or number for each cow. 2. Have pails of uniform weight. 3. Have scales that give the net weight of milk. 4. Keep a monthly record of weight of each day's milk. 5. Test the fat in the milk by preserving samples till the end of the month and then test. 6. Keep a permanent record, to which each month's record is transferred. 7. The breeders' associations should assist the work by supplying the utensils and giving prizes. 8. The fair test should be continued during the year by the owners of the cows. A two-day test was not of much practical value.

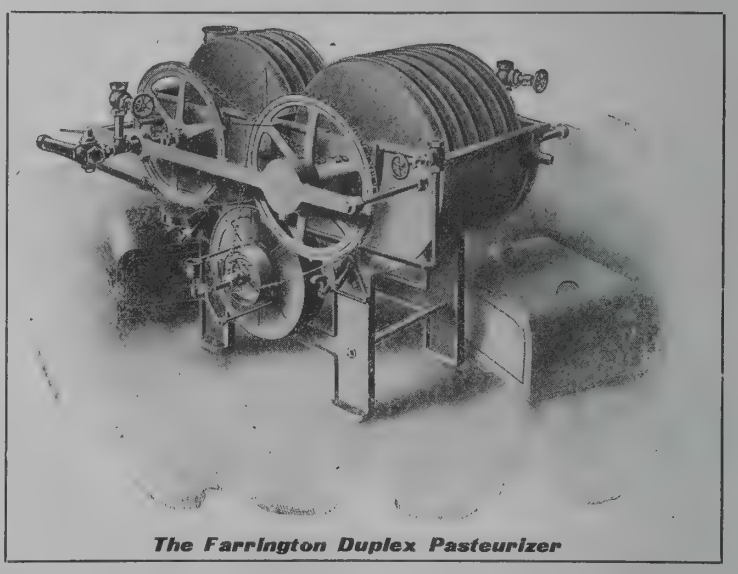
The dairy convention to be held at Belleville on January 6-8, and at St. Thomas on January 12-14, 1904, promise to be gatherings of unusual interest. Among the important topics to be discussed will be the proper curing of cheese, the transportation of dairy products and the best way of operating creameries. It is probable that the conventions this year will be without the presence of Prof. Robertson, who has rendered such valuable service at former gatherings of this kind. He has not returned from his sojourn in England, where he went last spring in search of health. It is reported however, that he is progressing favorably towards his former vigor and strength.

The total exports of cheese from Montreal for the season of navigation, closed near the end of November, were 2,382,426 boxes, as compared with 2,110,666 in 1902 or an increase of 270,758. The exports from Portland for the same time were 60,602 boxes for 1903, as against 56,948 for 1902, or a gain of 3,654, and from New York, 225,471 boxes for 1903, as against 160,472 for 1902, or a gain of 64,999. The total shipments of cheese from Canada and the United States for the season as above were therefore 2,668,497 boxes as against 2,328,086 for 1902, or a gain of 340,411 boxes.

Toronto. J. W. WHEATON.

Note and Comment.

Skim Milk vs Grain Protein in the Ration—Drawing Manure on the Land—Barn Comments—Slippery Cement Floors—Cheap Silos.



ED. HOARD'S DAIRYMAN:—In reading a long article the other day about protein in the rations, and getting it in this and that, I wondered what had become of Menzo Wilcox of N. Y., and his plan of feeding the skim milk of his dairy back to the same cows, a sort of endless chain affair it is true, but as I remember it, this man bought the best red cows he could buy of his neighbors, fed them early cut hay and secured a made butter average of 465 pounds per cow. With this ration he fed a small grain feed made up of corn and cotton seed meal and buckwheat middlings, and with skim milk added, his ration would figure down to an even 1 to 4, a ratio that would make Harry Hayward think twice before he said 1 to 11.

Has any one any figures to know about the comparative feeding value of skim milk to cows, as against grain proteins? I remember one claim Mr. Wilcox made, that the milk stimulated and maintained the milk flow better than any grain food he had ever fed. There is one thing in favor of a skim milk ration. One knows that the protein is not adulterated, and in fact, he would not be compelled to consult Dr. Jordan's feed tables to see how much cob dust, or pulverized oat hulls, such a brand of cow feed contained before buying it. Are those eastern fellows feeding skim milk yet? If so, why hide their lights, when make believe bran is $20 per ton?

The old question so often asked is up again "shall manure be drawn to the fields as fast as made," and it is somewhat important to the dairyman who is more largely soiling his stock year by year. One thing is certain, the man who keeps stable and yard clear of manure, has the cleanest time of it, and has far less trouble to keep his stock in presentable shape, let alone unpleasant smells. The chief objection to the plan is, that of great loss to the manure by washing, but such men as Prof. Roberts and others equally posted, say that the loss is inconsiderable as compared with fermentation,

"FEEDS and FEEDING" ....

A HANDBOOK FOR THE STUDENT AND STOCKMAN.

By W. A. HENRY, Dean, College of Agriculture, Madison, Wis.

This large octavo volume of 663 pages is the only book extant which summarizes all of the feeding investigations of all of the experiment stations of both the New and the Old world. It presents the latest discoveries of the scientist, and is replete with the practical experiences of the best stockmen. The information is arranged in the most helpful and readable manner possible.

PRICE $2.00 PER COPY POSTAGE PAID.

For Sale by HOARD'S DAIRYMAN.

washing and leaching in the yard, and about the barn. I think Prof. Roberts found that the summer's loss on a pile of good manure was 60 per cent, and in a year 90 per cent of all the fertilizing elements had disappeared. This is apparent, that where manure is drawn, and applied to sod ground, especially clover, a great corn crop will result, and where one commences to spread the manure in November, there the rankest growing corn will be found. To the dairyman this fertility question is one of moment. Profit now comes from cheapened feed, and cheapened feed means in a large measure the home grown crop.

To a certain extent the grain ration has, and is undergoing considerable of a revision, and oats and corn,—and no reason why barley should be made an outcast—now are allowed as the larger half of the ration of grain, and if these are to be grown on the farm, the more important the stable manure supply should be made the most of, as both these crops are natural feeders on stable fertility. The evidence goes to show that the losses in the field of winter spread manure are not as great as the wastage of pile and yard, and certain it is, that manure is never better for farm crops, or ever again as rich in available plant food, as the day, when made complete by absorbents, it carries with it the liquids of the stable and is ready to be carried out of that stable. A good cow and plenty of good fertility are two of the essentials of successful dairying, and the third essential is a level headed man, who does not already know it all, to keep the other two busy.

***

It was the same old story, a $2,000 barn with half basement, built on the north side of the slope; the south wall a dead one, because of the driveway and cistern, also had all of its few windows upon the north side and west end. The sunlight could never get into the stable. The architect had never thought of that. He had made the stable close, and all that, and wonder it was that he had provided ventilation. But the owner said the stable smelled bad, was damp, and always cold. Yes, there was no reason why it should be otherwise. Six ventilators, six inches square came down from somewhere, and stopped just six inches below the overhead floor. Sometimes the cold air came *down* them, and then again they "drew" and took the warm, and what was dry, air up the spout, and left all the damp, heavy, gas charged air on the floor. Combined, these six air shafts had a square inch surface of 216 inches, hardly half enough for the stable and stock. "I'll put a leg onto each of those tubes, that will reach within six inches, of the floor, and then if they don't draw, out they will all come, and some 40 foot high air shafts go up in their places." He can do that, but he can never make the sun go on the north side of the barn and shine into those windows.

***

A letter tells me of a man who followed out directions of advance dairymen and cemented his stable floor, and it is so slippery that his cows slip and slide upon it to their possible injury. What remedy? Well, next summer put on a very light coat of cement again and then "block" a garden rake so the teeth will be only a fourth inch long and cross-rake the floor and platform both, so to make them rough. It will smooth out a little before it sets, but there will be no more slipping and sliding and the bedding will stay under the cows and not slip back into the gutter. Instead of the rake you can use a stiff stub broom to roughen with. While cement floors are, as a rule, permanent and the best, they do need a good soft bed between them and the cows. It will save bunches, puffed knees, and stiffened joints with rheumatic tendencies. A cement floor without bedding is too cold a floor even for a cow to come in direct contact with.

***

Speaking about building silos as depicted in a late DAIRYMAN makes even the old "breath stoppers" laugh. First, we had Geo. Scott sail in with his $65 silo, made out of three wooden-rimmed cheese boxes set upon end and stayed into perpendicular with four rails, that, trigged out with Dairy Straws, made us all wonder; but now comes a fellow from the isles of the sea and J. A. M.'s silo to cost $25, and announces that he can cut this price by a wide margin. One could not steal the lumber and build one for $25 in the states, even if one was in with the lumber trusts and a government pull.

This evolution in silo building is liable to do away with all the cost of building the things, and silage will get so cheap that the cows will refuse to eat it, and this last disaster of the dairy will be its undoing. Out in Oregon they saw off a suitable length of a hollow redwood log, end it up, and call that a silo, but one of these log silos costs $26.75 when ready to fill, so the Island silo is ahead. I think if Scott will revise his figures he will find a mistake. His silo could not have cost $65, as he brought the entire material home on a one horse wagon, and he and another friend, built and filled the silo in two days and wrote the Dairy Straw letter besides. We are still standing by Scott until he is J. A. M.-ed a great deal harder.

JOHN GOULD.

Ohio.

Bermuda Grass.

ED. HOARD'S DAIRYMAN:—I note on page 980, in answer to A. F., that you do not speak very highly of our Bermuda grass. This must be a slip from some Junior—when the Senior, or Prof. Henry was not around as, after their experience in their trips south, I think they will bear me out in saying: "There is no better grass for summer pasture for the Southland." We have many pastures, 1 acre to 2 cows, and doing well, and if our farmers would today plant ⅓ of their ground to it and alfalfa and Johnson grass to raise stock, the south would not be so badly scared about the Mexican cotton boll weevils.

I. C. W.

Cornelia, Ga.

While it is true that the answer referred to was written by "some junior," it is also true that it was a quotation from what is supposed to be good authority. We are very glad to be set right, in so far as "authority" was at fault, and can most heartily subscribe to the doctrine that more grass and less cotton would be a decided advantage to southern agriculture.

Disposing of Glue Waste.

ED. HOARD'S DAIRYMAN:—I would like to ask for information in regard to using hide shavings after glue has been extracted, using the refuse as a fertilizer. What would it be adapted for and would it be necessary to put anything with it to make it a first class fertilizer.

Housatonic, Mass. R. O. H.

These refuse shavings can be disposed of in two ways, either by composting them with loam or sod until they are decomposed and then spreading the mixture thinly on the land, or by dissolving them in sulphuric acid and then using the acid for decomposing bones or other forms of phosphates. Not knowing the condition in which the waste is in nor the amount available, we cannot say which would be the best method, but if there is a comparative small amount of it, and especially if it is very wet, composting it would be the best method to dispose of it. In either case it would make a highly nitrogenous fertilizer and should be used sparingly.

IS there going to be a Farmers' Institute, Convention, Farmers' Club, or Patrons' Meeting near you? If so why not take a few copies of Hoard's Dairyman for distribution. A good club of subscribers can be secured at these meetings with less trouble than at any other time. Drop us a card about ten days before meeting saying how many sample copies you want for distribution. The rates of subscriptions sent in clubs are:

TWO SUBSCRIBERS, $1.50 THREE SUBSCRIBERS, $2.00
FOUR SUBSCRIBERS, $2.50 FIVE SUBSCRIBERS, . $3.00

A Kansas Expert on Alfalfa.

H. M. Cottrell, Manager of the Brookmont Farm in Iowa, Gives the Result of Many Year's Study and Experiment With This Plant—Soil, Seed and Cultivation.

H. M. Cottrell, manager of the great Brookmont farm near Odebolt, Iowa, knows more about alfalfa, according to Chief F. D. Corborn of the bureau of animal industry of the world's fair, than any other man in the West. Mr. Cottrell has lived in Kansas twenty-one years, and nine years of that time were spent on the state experiment farm. He has made a special study of alfalfa, and was invited by the Farmer's Institute of Iowa to talk about it before that body. He discussed the subject in all its phases, and the following summary of the information he gave will be of great interest:

The conditions demanded by alfalfa are a perfect seed bed, fertile soil and freedom from weeds at time of seeding, and good drainage. It is probable that alfalfa will do best in Iowa on the naturally well drained fields, and when the land is sufficiently rolling to afford good drainage, may be expected to do well under proper treatment.

Alfalfa needs a good supply of lime and is short lived in sandy soils. It is probable that alfalfa will do well on many level lands, where the drainage has put the land in good shape. Alfalfa will not grow with wet feet, and the land must be well drained either naturally or artificially. On close soils alfalfa sometimes kills out in low places and small depressions where water stands.

With land that has been under cultivation for many years, crops must be grown that will free the land from weeds and put it in a good mechanical condition. Barley, oats and millet may be recommended for Iowa, followed by fall plowing thoroughly done.

The best crop to raise on land before seeding to alfalfa is some legume like clover, Canada field peas, soy beans or cow peas. Red clover is a good plant to grow before seeding to alfalfa on soils that have a subsoil, which holds water and prevents good drainage. Red clover is much more vigorous than young alfalfa, and will grow down into bad subsoil under conditions that will kill young alfalfa. After the red clover has stood for two years and has penetrated the subsoil to a good depth the ground can be prepared and seeded to alfalfa. The decaying clover roots will keep the subsoil open and well drained, and will furnish nitrogen to the alfalfa plant until it reaches full vigor, when it will yield a much larger crop than clover, and each pound of alfalfa will be worth considerably more than an equal amount of clover.

The ground for alfalfa should be thoroughly pulverized and deeply plowed, but it must be well settled before seeding and only the surface loose. Alfalfa will usually fail if seeded on freshly plowed ground. If it is necessary to plow the ground before seeding, plow as early as possible, harrow thoroughly, making a good seed bed, and then wait until a good rain has settled the soil before seeding. The seed bed is the most important factor in securing a stand of alfalfa.

Seeding in Iowa should be done in the spring, after the danger from hard frost is over. On Brookmont farm sixty-five acres were seeded April 24, 1903, and made a good stand. Severe frosts will kill alfalfa if they occur just as the first two leaves appear. Mr. Cottrell recommends twenty pounds of seed per acre. With every condition favorable, experienced alfalfa growers sometimes succeed in getting a good stand by using ten to fifteen pounds of seed per acre, but this small quantity is not generally sufficient. It pays to use enough seed to secure a good stand, as alfalfa, unlike clover, never thickens, and the number of plants per acre tends to continually decrease.

The most even stand is secured by sowing with a broadcast seeder and harrowing lightly. Alfalfa should be sown alone. It does not want a nurse crop. Sometimes a good stand is secured when alfalfa is seeded with some other crop, but many times it fails utterly. Young alfalfa is a delicate plant, and needs all the plant food and sunshine available, and usually when it has to share these with another crop it dies.

The young alfalfa is one of the weakest plants grown. It grows slowly, is a weak feeder, and is easily checked or killed by weeds and by unfavorable conditions of soil, weather or treatment. Mature alfalfa is a most vigorous plant. It grows deeply into the soil, is a vigorous feeder, and lives and yields well

MILK DEALERS COMBINATION Milk Protector, for cans or bottles. Prevents milk churning and souring in summer and freezing in winter. INVESTIGATE. S. C. Sullivan Mfg. Co., Erie, Pa.

PURE BRED SHORTHORNS
CHOICE BULLS FOR SALE.
Also Cows and Heifers bred to Clay Buttercup, 125851, a descendant of the Clay Family, champions at the World's Fair dairy test.
GEO. WENHAM, Fort Atkinson, Wis.

AYRSHIRE CATTLE of the BEST of BREEDING. Also Chester White Pigs, ready to book for season's trade. Young stock of both sexes. Prices reasonable. Come and see us.
F. TSCHUDY & SONS, Monroe, Wis.

GUERNSEYS Descendants of Bonny Boy and Lily Ella. Prices reasonable.
J. G. HICKCOX,
700 Stowell Avenue, Milwaukee, Wisconsin

GUERNSEYS
REGISTERED GUERNSEY BULLS FOR SALE from Advanced Registry, and high-grade stock. Pedigree and price furnished upon application. All animals are tuberculine tested.
WOODEND FARM,
ST. BONIFACIUS, MINN.

GUERNSEYS FOR SALE. The increase of my herd is a few young things of both sexes, from one to eighteen months old. Prices corresponding to age and quality. F. W. TRATT, Whitewater, Wis.

SPOTSWOOD GUERNSEYS
We offer some grand Imported Cows and Heifers, large and deep milkers and high testers; a fine lot of Heifers fit for service, and a few Imported Bulls from prize winners on both sides. Any animal in the herd for sale. Address WALTER JAUNCEY,
Spotswood Farms Broad Axe P. O., Pa.

OLD HOMESTEAD GUERNSEYS
Greatest Prize Winning Herd of the Breed, defeating all competitors at 22 state fairs during last five years. 20 cows of this herd indicated by Babcock test, an average of 456 pounds butter per cow for one year. Several bulls of service age, and a large number of bull calves for sale; also a few choice females.
Especially low prices, standing of herd considered. No catalogue. State what you want.
L. V. AXTELL, Perry, Lake Co., Ohio.

Florham Guernseys.
The herd is made up of representative animals of both home and foreign breeding.
BULL CALVES,
from large producing dams for sale. Apply to J. L. HOPE, Supt., Florham Farms, Madison, N. J.

GUERNSEYS HADDON FARMS Home of the noted GLENWOOD GIRLS—First in the Advanced Registry. Have always been free from tuberculosis. E. T. GILL, Haddonfield, N. J.

GUERNSEYS FOR SALE
Bulls two years old out of Count Topsy 24.27 lbs. butter 7 days. She won first prize at Wis. State Fair 1902. Also a few yearling bulls and bull calves. FRED CLAUSING, Grafton, Wis.

Hillsover Farm Guernseys.
FREDONIA, Chautauqua County, NEW YORK,
Bulls and Young Stock
FOR SALE.

ALTA CREST FARM, SPENCER, MASS.
Home of the Yeksa Family of Guernsey Cattle. Herd contains more cows with large records and backed by large records than any other.
HERD OF
GUERNSEY CATTLE
IN THE COUNTRY
Herd headed by Primative 4909, a son of Primrose's Tricksey, Adv. Reg. No. 2, 592 lbs. butter in one year. Several Bull Calves from elegantly bred Dams at reasonable prices. Address
A. H. SAGENDORPH, Spencer, Mass.

GUERNSEYS FOR SALE.
Largest herd in the West. Descendants of the cows Lily Ella and Lilyeta. Service bulls are Vanquisher, grandson of Lily Ella, Imp. Troupers Pride, Tops of Gold and Lord Yexa.
JAS. H. BEIRNE, Oakfield, Wis.

THE BROWN BESSIE HERD Offers one bull 14 months old, sired by Recorder, 29239, the only living son of Brown Bessie and has 14 tested daughters. Dam, Relay, 70353, test 17 pounds 2 ounces. She a daughter of Diploma with 61 tested daughters. Also Berkshire Pigs of English and American selected stock.
H. C. TAYLOR, Orfordville, Wis.

KING OF ST. LAMBERT'S KING 30752
Sire of thirty-three tested daughters, is unquestionably the most prepotent of any Jersey sire in the land. We have for sale young bulls rich in his blood; also a few cows and heifers in calf, whose progeny will be attractive because of the "Hart's King" blood in them. For prices, etc., address
FRANK W. HART, CLEVELAND, OHIO.

JERSEY BULL CALVES.
Thrifty, handsome fellows, 7 to 12 months old. sired by Golden Blyth 3rd, 54569 A. J. C. C. a son of Imported Golden Blyth and King's Nana; butter test 21 lbs. 4 oz. in 7 days; 40 lbs. in 14 days. Price low if taken at once, One of these calves is out of Mildred Micawber.
R. C. GREEN & CO., Albion, Wis.

MILK BUTTER
BILTMORE JERSEYS
ILLUSTRATED CIRCULAR OF YOUNG BULLS FROM SELECTED DAMS, with very reasonable prices attached, can be secured by sending a postal.
If they don't improve the milk and butter yields of your herd we offer your selection of another free of charge.
DON'T FORGET we are headquarters also for Berkshires and Standard Poulty. Apply to
BILTMORE FARMS, BILTMORE, N. C.
CONSTITUTION TYPE

WASTELAND GUERNSEYS
SPECIAL SALE
To reduce our stock we offer for sale a few Cows and Heifers. We also have some good Bull Calves sired by "Sir Coral" 5239, and "Glenwood's Sheet Anchor of Haddon" 6372. Write at once for description and prices.
M M. & E. J. HOLLINGSWORTH,
Landenberg, Chester Co., Pa.

Rosendale Guernsey Herd
TUBERCULIN TESTED.
Sixty head of choice Guernseys headed by Coralette's Son, (see page 450) whose dam, Coralette made 479.7 lbs. fat in one year at 3½ years old, and was first prize cow at Wisconsin State Fair in 1896.
Some fine young bulls for sale.
GEO. C. HILL & SON, Rosendale, Wis.

AMERICAN JERSEY CATTLE CLUB
OFFICES: 8 W. 17TH ST., NEW YORK.
President, ELMER A. DARLING.
Secretary, J. J. HEMINGWAY.
BLANKS for Registering and Transferring Jersey Cattle; also Blanks for Private Butter Tests of Registered Jersey Cows, furnished free of charge upon application to the Secretary.
FEES for Registering: To non-members, $2 each head male or female. To members of the Club, $1 each head, male or female. All animals over two years old, double fee. For registration of all dead animals, $1 each. Imported animals, $25.
TRANSFERS are recorded free, if presented within 90 days from date of delivery. Transfers presented after 90 days, $1 each.
PRICE of Herd Register, $1 per Single Volume. Butter Tests of Jersey Cows, including all tests received by the Club to August 1, 1898, $2 per volume. Private Herd Record, 330 pages, cloth, leather back and corners, $2. Pocket Herd Record, 120 pages. flexible leather, 50 cents.
VOLUME OF BUTTER TESTS from August 1, 1898, to July 15, 1902, $1. Consolidated Volume, containing all previous tests, $2.00.
THE BY-LAWS of the Club, giving full rules to be followed in securing registration and transfers, mailed free on application.

FOR SALE A lot of solid colored, registered Jersey Heifers, either singly or by carload, cheap.
N. F. BERRY . . . LEXINGTON, KY.

JERSEY BULLS Now or soon to be ready for service; also several well bred HEIFERS. Let us send you prices and breeding, with milk and butter records. All stock is registered or eligible.
E. E. STEVENS,
North Madison, Ohio

FOR SALE Son of Pedro's Pretty Pogis, 33660, A. J. C. C., a superb son of old Pedro, both of World's Fair fame. Two yearlings from tested dams. Some royally bred Poland China Pigs, March and April farrow.
J. Q. EMERY & SON, Albion, Wis.

ST. LAMBERT BULL CALVES by Lucy Stoke Pogis 4th, sire of 13 tested cows. $25.00.
W. J. HUSSEY, Mt. Pleasant, O.

HIGH CLASS JERSEY BULLS
Heifers and Cows for sale. My foundation stock the best I could buy from a herd famous for merit. Write for what you want.
WM. B. GOODRICH, CLIMBING HILL, IOWA.

PROSPECT HILL JERSEY HERD
The cow that can DO something is what the farmers want. Eight cows have finished their official year's work making an average of 524 lbs. each. F. H. SCRIBNER, Rosendale, Wis.

FOR SALE. Two A. J. C. C. Bulls ready for service; also some younger ones. Cows and heifers in calf to richly bred bulls. Write for pedigrees and prices. We have a few Berkshire Boar Pigs from unregistered sows left; cheap.
N. N. PALMER & SON, Brodhead, Wis.

POLLED JERSEYS
Richest Cow of all breeds in Pan-American Model Dairy. Winning Herd at Ohio and New York State Fairs, 1903. W. H. FORBES & CO., Yellow Springs, R. R. No. 1, Ohio.

But Two Bulls Remain
That are old enough for service. One combines the blood of Stoke Pogis 5th, "Exile", "Ida's Rioter", Mary Anne", "Naiad", "Crocus", Allie", and Mollie Garfield", and the other four crosses of "Eurotas", through three of her sons, with some of the best St. Lambert blood.
To induce immediate sale these are priced far below their worth. If in need it is for your interest to write for pedigrees, and to do it TODAY. Ask for Sale List A20.
WINTERGREEN HILL FARM
SCOTTSVILLE, N. Y.

VALLEY FARM Offers five Yearling Heifers sired by "Diploma's Victor 56810" and safe in calf to a grandson of "Golden Lad." Also 1 yr. bull. The 6 head in a young herd cheap to make room for Winter. Write for particulars to
FRED STUBLEY, Black Earth, Wis.

N. H. ROBINSON, Prop., Centralia, Wis.

HAZEL FERN HERD. A. J. C. C. Jerseys, blood of St. Lambert, Melia Ann, Combination, Pedro, and Golden Lad. A. G. C. C. Guernseys, Registered Berkshires. Inspection and correspondence invited. Young things, both sexes, for sale.
ESTATE W. S. LADD, Portland, Oregon.

Just for Nothing
We will send you THE JERSEY BULLETIN and HOARD'S DAIRYMAN to the end of 1903. But while making you this generous offer, we wish you to do something.
Subscribe for both papers for 1904, at the lowest clubbing rate, $1.75 FOR THE TWO. To make it plain, send us $1.75 and we will send THE JERSEY BULLETIN and HOARD'S DAIRYMAN to January 1st., 1905.
For Sample Copy of Jersey Bulletin address Indianapolis, Ind.
"IT'S UP TO YOU!"

under many unfavorable conditions. For this reason it will pay well to give the baby alfalfa plants good care and favorable surroundings for the first year of its life,

Young alfalfa responds most vigorously to a top dressing of fifteen to thirty loads per acre of manure. The top dressing is of especial value when done after the ground is frozen, the fall after seeding, as it checks the alternate freezing and thawing that causes lifting. Young alfalfa must have a fertile soil.

Alfalfa should be run over with a mower three or four times the first season, to keep the weeds down. The mower should be set high, and the weeds mowed so often that when cut and allowed to remain on the ground will not smother the alfalfa. Some good alfalfa growers mow the alfalfa three or four times the first season, when there are no weeds, as they find that the pruning of young plants makes them more vigorous. The cut vegetation should be left on the ground to act as a mulch. If mowing has been delayed until the weed growth is heavy, it is often necessary to cut the weeds, rake, and take them off the ground, to prevent smothering of the alfalfa.

No stock of any kind should be allowed on alfalfa the first year of its growth. Cutting acts as a tonic to alfalfa. Whenever alfalfa does not thrive, cut it. This applies throughout the life of the plant, from the time it first becomes high enough to cut with a mower, and through all the years of its life. Whenever alfalfa begins to bloom, cut it, no matter how short, unless seed is desired.

Alfalfa should be cut when not more than one-tenth of the plants are in bloom. Cut at this early stage the yield of hay for the season will be much greater than if the alfalfa is cut near maturity, and every pound of hay secured will be worth more for feed.

The late cutting of the first crop seems to injure the plant more than at any other time, and Mr. Cottrell says he found it profitable to cut alfalfa the first time as soon as one-tenth was in bloom, even though the weather was bad, and he knew that the crop would spoil in curing. The increased yield from succeeding cuttings over that cut late, much more than makes up for the loss of the first crop.

Successful clover growers the first time they try alfalfa often ruin the stand, so that it has to be plowed up, by waiting to cut until it reaches the stage at which clover is usually cut. Mr. Cottrell says: "It is going to be difficult to cure the first crop of alfalfa hay in Iowa. On Brookmont farm we are going to save straw for the first crop and stack straw and alfalfa in alternate layers. With ordinary weather no difficulty will be experienced in stacking the second and third cuttings."

Shredded Silage.

ED. HOARD'S DAIRYMAN:--I saw in your paper of this date, a question and answer in regard to shredded silage. Thought perhaps the enclosed, copied from Woll's Book on Silage, had escaped your observation, and I copy it as printed. If you think Mr. Dawley authority, I would be glad to see this printed, for I am interested in getting at the facts as to shredded silage. This may bring out additional facts on the subject.

"The Director of Farmers' Institutes for the state of New York, Mr. F. E. Dawley, in recent letters to the writer, speaks of shredded silage: "I am not apt to become enthusiastic over any agricultural implement which I use, but I think the nearest I have ever come to it, is over the shredder. I have had ten years' experience with silage and two with the shredder, so I feel that I know a little something about the keeping qualities of corn silage. I am inclined to think the idea, which is probably correct scientifically, that the more you break down the tissues of the corn plant, thus exposing a large surface to the air, the more sour the silage will be, is generally correct in practice.

But I find by these two seasons' experience that the corn which is cut off finely by the shredder, will pack in the silo very much more compactly, and in these two instances at least the silage has been the sweetest we ever had. * * The material packs more closely than the shortest cut silage that I have ever put in, no matter how finely it was cut. The ears are all torn to pieces so that the grain is more thoroughly distributed in the mass than it is in cutting, and as the stalk is all torn to pieces, this and the leaves are more thoroughly intermingled. I have weighed corn into my silo and know from actual experience that I got practically one-fifth more corn in when shredded, than when cut. * * As far as the results in feeding are concerned, I can see no particular difference, the advantage of shredding being in the finer cutting of the corn, compactness of the material in the silo, and the results in keeping, which one would naturally expect from this condition. * * The only disadvantage that I have noted is that a little more power is required, * * As an indication of the favor with which shredded silage is received here, I can say to you that from the small beginning which I made two years ago, three or four shredders have been purchased in this section, and if I wished to send my machine out with men to run it, I believe that nine-tenths of the silos in this community would be filled with shredded silage. M. F. PECK & SONS.....MARSHALL, WIS.

LOOK HERE
34 cows and heifers in the McGEOCH HERD have been officially tested with the following results: 10 cows average 20.26 lbs. butter in seven days; average per cent of fat 4.06. 7 four-year-olds average 16.82 lbs. butter in seven days; average per cent of butter fat 3.93. 9 three-year-olds average 15.06 lbs. of butter in seven days; average per cent of fat 3.60. 8 two-year-olds average 12.16 lbs. of butter in seven days; average per cent of fat 3.60. We have a few young bulls out of some of these cows, and sired by Gem Pietertje Hengerveld Paul De Kol, or Sir Ormsby De Kol for sale. One of these is out of a cow that made official record of 24.88 lbs. of butter in seven days; average per cent of fat 4.47. Are these the kind of Holstein-Friesians you wish? If so, can we not interest you in putting a bull from this class of stock at the head of your herd?
For particulars address H. B. Daggett, Mgr., Station A, Milwaukee, Wis. Residence: National Ave., near 40th. Phone, South 1601.

TYRANENA HERD
100 HOLSTEIN-FRIESIANS
A. R. O. STOCK FOR SALE.
Both sexes, all ages. Herd headed by Sir Piebe Hengeweld De Kol, No. 27929, dam Piebe Laura A. R. O., 21 lbs. 8 oz. Average percent fat 4.62. Eight official records in pedigree that average 23 lbs. 5 oz. Frank B. Fargo, Lake Mills, Wis.

SHADY NOOK HERD HOLSTEIN-FRIESIANS. Offers 5 yearling bulls cows and heifers bred to oldest son of Mercedes Julip's Pietertje, No. 39480. Chester White Pigs in pairs and trios, not related.
W. R. GATES, Fort Atkinson, Wis.

HOME FARM HERD.
Headed by COLANTHA 4TH'S LAD. Official test of three nearest dams, 25.1 lbs. butter in seven days. Herd numbers 125 head.
BEST FAMILIES REPRESENTED.
Special prices on six or eight bulls of serviceable age. W. B. BARNEY & CO., Hampton, Ia.

ELMWOOD Home of Leila Pietertje 27 lbs. 5 oz. butter in 7 days, A. R. O. Two sons, two daughters, and many others closely related to this great cow. Any animal in herd for sale.
GEO. T. McNEIL, Theresa, N. Y.

FOR SALE H.-F. A. R. O. cows and heifers, bred to Duchess Ormsby Piebe Burke, No. 29328. Also young calves from same sire. One wishing the blood of Duchess Ormsby, address Rural Route No. 2. W. H. JONES, Watertown, Wis.

THE MONONA FARM HERD
OF HOLSTEIN-FRIESIANS
Four fine yearling bulls for sale. Also a few choice bull calves. Paul Calamity De Kol, 31095, at the head of the herd. His pedigree contains ten records averaging 27.32 lbs. butter in seven days. His seven nearest dams average milk record of 169.50 lbs. one day. Breeders and dairymen please write for prices.
F. W. ALLIS, Monona Farm. Madison, Wis.

FOR SALE H.-F. BULLS, ready for service, from A. R. O. cows and sired by Sir Johanna DeKol, 25467 A. R. O. Butter record of dam, 24.03 lbs. at 4 yrs. Also Improved Large Yorkshire Pigs. C. A. SCHROEDER, West Bend, Wis.

VALLEY FARM HERD
HOLSTEIN-FRIESIANS
Headed by Korndyke Queen De Kol's Prince, dam Korndyke Queen De Kol, 24 lbs. 6.7 oz., grandam Belle Korndyke, 25 lbs. 12.3 oz. Both sire and dam by Manor De Kol, his dam Netherland Hengerveld 25 lbs. 10.66 oz., Manor De Kol by a son of De Kol 2d, 26 lbs. 9.21 oz. All are official tests and average 25 lbs. 13.72 oz. butter for 7 days and 3.95 per cent fat in their milk. Two bull calves now for sale and young ones after Sept. 1.
DON J. WOOD, R. F. D. 2, West Winfield, N. Y.

SUNNY SIDE HERD Offers for sale a young bull whose dam as a three-year-old and sire's dam have an average official record of over 20 lbs. in 7 days. Price right. Address C. A. SNOW & SONS, Athens, Ohio.

HOLSTEIN-FRIESIANS INDIVIDUALITY, PERFORMANCE, BREEDING. You need it all. Write or come. 100 head. McKAY BROS., Buckingham, Ia.

HOLSTEIN-FRIESIANS
FAIRVIEW HERD
We offer bulls ready for service; also heifer and bull calves not related, of the kind to suit the most particular.
O. J. GODFREY, Pennellville, N. Y.

THE LAKESIDE HERD OF HOLSTEIN-FRIESIANS 65 head in number, is situated within 10 rods of the C. & N. W. Depot. Stock of both sexes and different ages for sale. Bulls in service are: Homesterd Prince De Kol No. 25663. Sire: Pietertje Hengeveld Paul De kol No. 22128. Dam: Shadeland DeKol No. 41886 A. R. O. in 2 y. f. milk 383.2 lbs., butter 15 lbs. 5.3 ozs. and Canary's Mercedes Sir De Kol No. 29175. Sire: Count Colantha Alban No. 25148. Dam: Canary's Mercedes No. 12586 A. R. O. Milk 409.5 lbs., butter 25 lbs. 2.6 ozs. Average per cent fat 4.92. Correspondence solicited.
WM. EVERSON & SON, Lake Mills, Wis.

HOLSTEIN BULLS. We have some grandly bred young bulls ready for service. One of the largest and best advanced registry herds in the United States.
PIERCE LAND & STOCK CO. 14 Turk St. San Francisco, Cal.

MAPLES STOCK FARM
FULTON, NEW YORK,
Offers for sale Twenty-Five Choice Heifer Calves sired by Beryl Wayne De Kol Paul and Lilith Pauline De Kol's Count. Prices right to quick buyers. State just what you wish. JOHN C. GODFREY, R. F. D. 3. Fulton, New York

SPECIAL BARGAINS IN
Holstein-Friesian Bulls
From a few months to a year old, from official record dams, and with strong official backing on both sides. The sire is half the herd; it is important that you get the right one. We have that kind, and our prices are no higher than others are asking. HENRY STEVENS & SON, Brookside Stock Farm, Lacona, Oswego Co., N. Y.

FOR SALE 2 H. F. Bull Calves, 6 mo. old, sired by Johanna Aaggie's Paul De Kol 23443, (160 A. R.) from good milkers and testers.
M. S. CAMPBELL, Genoa, DeKalb Co., Ill.

CLOVERDALE HERD
Is now better than ever prepared to fill your orders for a foundation herd of young Holsteins. For individual merit and performance our herd ranks well up among the best in America. Write us your wants before buying. Address
A. J. DAUGHERITY, Streator, Ill.

Woodlake Herd.
Advanced registry Holstein-Friesians of leading families at reasonable prices. Small calves of both sexes cheap. JOHN B. IRWIN, Station D., R. 1, Minneapolis, Minn.

MARKHAM MANOR FARM,
Simonsville P. O., Andover, Vt.
Holstein-Friesian cattle, bred from the most fashionable butter families, individually large producers, and of the most approved show form. The herd contains seven daughters of Sir Netherland Soldeme Clothilde. No. 13370, H. F. H. B., the most remarkable show bull of recent years. Also large English Berkshire swine from noted prize winning and imported stock. Write for discription and price to J. A. THORNTON, Manager, Simmonsville, Vt.

HOLSTEINS IN CALIFORNIA
SAN ANSELMO, MARIN COUNTY
250 HEAD IN THE HERD
Sires are sons of Mercedes Julip Pietertje, Colantha 4th Belle Korndyke, Fay Barnham Princess Wayne 7th. A fine lot of bull calves
R. M. HOTALING,
Rialto Building San Francisco, Cal.

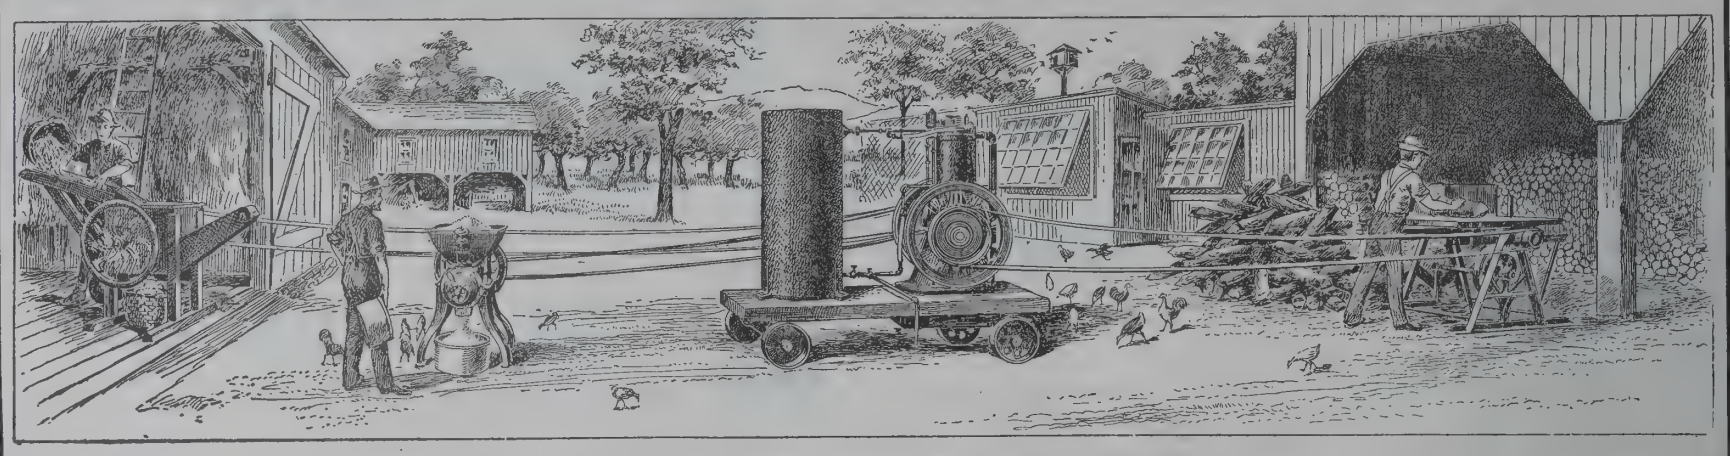
SOUTH SIDE FARM
WHITE BEAR LAKE MINN.
HOLSTEIN-FRIESIANS—We now offer at attractive prices fine young bulls from high tested A. R. O. cows, and sired by Prince Inka Pietertje De Kol 2nd, who already has to his credit 11 A. R. O. daughters. To make room in our stables we offer a few cows and heifers for sale at low price. Write us for particulars

OAK GROVE HERD Headed by Mechthilde De Kol Pietertje Paul, No. 29548. Nearly all of the leading families represented and for sale. C. H. STEVENS, Jefferson, Wis.

HOLSTEINS
High Class Advanced Registry Stock only. Best butter families. Stock for sale.
Woodside Farm, Princeton, Worcester Co., Mass. JOHN B. MARCOU.

T. G. YEOMANS, strain of H. F. Cattle, nearly the same breeding of Sadie Vale Concordia. Waynes Aaggies, Netherlands, Americas, Pauline Pauls and De Kol Bulls old enough for service, and Bull Calves for sale.
Wm. O. Jackson & Sons, South Bend, Ind.

JUST BULL CALVES
We have three, that are individually fine. They are bred right, have been fed right, and the price is right.
Ohio's Famous Herd, Holstein-Friesian Cattle. W. B. SMITH & SON.
2488 W Broad St, Columbus, O.



HOLSTEIN-FRIESIAN BULL CALVES
Of advanced Registry. Young stock from cows testing high in butterfat, at reasonable prices. If you want the best address
JOHN SHUGART & SONS, Marion, Ind.

FERMANAGH HERD
HOLSTEIN-FRIESIANS
Bulls ready for service from A. R. O. animals sired by Johanna Rue 2d Paul De Kol, sire of 13 A. R. O. cows. Also young bull calves by same sire. THOS. GAINES, Supt., Arcadia, Missouri

FINE POULTRY FOR SALE
I offer a very select lot of White as well as Buff Plymouth Rock Fowls of the present year's breeding for sale. Each breed have been kept on separate farms and are absolutely pure in their breeding. They will be sold at
$5.00 A TRIO
Nicely crated on board of cars here.
Single Fowls, $2.00 Each
They have had the range of alfalfa fields the past summer and are very vigorous.
A. R. HOARD, Fort Atkinson, Wis.

Dairy Questions Answered by Prof. Farrington.

BUTTER STORED AT DIFFERENT TEMPERATURES.

"We have some butter that was put into cold storage in the latter part of July and August. The butter seemed very fine when made and the color, salt and grain are perfect now, but it is strong. We put only our surplus in storage and sold a part of the other batch at top prices. We cannot, therefore, understand what the matter is with the butter now. Can you suggest anything that will give light on this subject? I am making butter every day that is selling one cent above the market, and cannot understand what made my butter in storage go off so in flavor. Is there any way of re-working butter to sweeten it and take away that strong flavor and make it marketable? * * *

Van Dyne, Wis.

It has been demonstrated in the last few years that the peculiar flavor of June butter can be best retained by holding the butter while in storage at a very low temperature. A few years ago June butter was put in the freezers and held at a temperature of 10° to 15° above zero. This butter came out in the fall and winter fairly good in quality, but in some cases it showed its age very perceptibly. Within the past year or two the temperature of holding butter has been reduced until now a great deal of it is stored at so low a temperature as five degrees below zero. We have put our surplus from the dairy school creamery, during June and July, into two cold storage establishments during the past year. At one of these the butter was held at 15° above zero and at the other 5° below zero. Some of this June butter has been returned to us recently from both places and the difference in quality is very noticeable. That which was stored at 15° above zero, although it has remained frozen during the months it has been in storage, is not nearly so clean, sweet and fresh as some of the same butter that has been stored at 5° below zero during the same time.

This is the first demonstration of the sort that we have made in this direction, but the difference in the quality of the butter stored at the two temperatures is noticeable, and we are fully convinced of the superiority there is in storing butter at the lower temperature over the higher.

If your butter was of fancy quality when put in storage, and you find it is now strong and has an old taste, I think the cause of this deterioration is undoubtedly the temperature at which your butter was held while in storage. If you attempt the storing of butter in the future, I will suggest that you place it in some freezer where the temperature goes below zero, and is held there until the butter is taken out.

I presume you know that butter will not keep very long after it is taken from cold storage, and it should be sold and consumed within a week or so of the time it is removed from storage. Frozen butter, when it thaws, will go "off flavor" very quickly, but if it is held below zero the quality of such butter, when first taken from storage, is excellent, provided it was good butter when placed in storage.

In connection with our experiment made during the past season, of placing butter in storage at two different temperatures, we colored the butter with two kinds of color, one of which was a vegetable color and the other made from coal tar. We did this in order to secure evidence on the question as to whether or not butter colored with a vegetable color will change more in storage than that colored with the coal tar color. Some butter colored with each of the two kinds of color was placed in each of the two refrigerators mentioned, at the different temperatures. This butter has just been taken out and examined, and that which was colored with the vegetable color proved to be fully as uniform and as deep a color as that which was colored with coal tar when the butter was made. This shows to our satisfaction that the use of vegetable colors in coloring butter for storage will undoubtedly be perfectly satisfactory, and no one need fear that the color will fade or change in any way while in storage, on account of the butter being colored with a vegetable color.

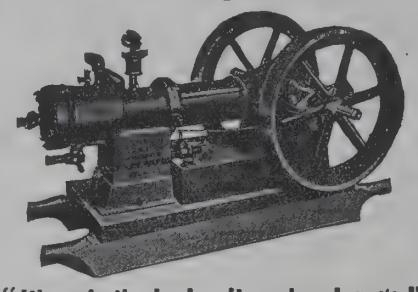
There are methods of re-working strong butter so as to sweeten it and improve its flavor. Process butter is made from strong, old butter collected from various sources and sweetened by the process through which it is put at the process factory. I do not know that this has ever been successfully attempted at a creamery on a small scale, but the large process factories undoubtedly change the quality of old, strong butter decidedly, and turn out a product that is far superior in flavor to the material from which it was made.

CEMENT FLOORS IN CREAMERIES.

The creamery here has a poor cement floor in it. The floor in the churning room is the worst. The cement is broken and a part of the top layer is all off; the cement in some places is also washing out. It is in such bad shape that we must put in a new floor. I am thinking of patching the old floor as best we can with cement and then lay a good floor of southern pine boards over this cement. Would you advise our filling in between the cement and the wooden floor with anything or shall we lay the boards directly on the cement? We have a good factory with the exception of this poor floor and have made butter which sold as extras during the entire season. * * *

Norwalk, Wis.

The cement floor which you describe is similar to many that have been put into creameries and farm dairies. The defects from cracking and crumbling are caused by either the ignorance or the incompetency of the parties who laid the cement. It has been demonstrated over and over again that a cement floor can be laid in a creamery, that will not crack or crumble. It is useless, however, for a mason to attempt to make a cement floor unless he is thoroughly posted on mixing cement with sand in proper proportions and knows what is good cement when he is using it.



You can easily have this old cement floor taken up and a new one laid if you prefer a cement to a wooden floor. A floor of southern pine which you mention laid over the cement will undoubtedly be satisfactory, if the boards are laid on joist above the cement and the space be-

FOOL-PROOF

BECAUSE IT'S SO SIMPLE

THE ELI GASOLENE ENGINE } Is the BEST because it has no gears, cams, levers or valve mechanism. Don't Be Jollied into buying a complicated engine that's always out of order—get the ELI—no trouble then. Now get busy brother and write for booklet to-day.

Eagle 4 H. P. Stationary Engine

1904 MODEL

THIS ENGINE is of the four Cycle type and is especially designed and adapted for use on the farm—for separators, churning, pumping, elevating, hoisting, cutting ensilage, etc. No Expert or Engineer required to operate it—very simple in design and compact in construction. This engine is built so it can be easily moved from place to place. We can supply a special belt driven pumping jack to be used in connection with any pump having a wind mill head. Write for prices and description to

EAGLE BICYCLE MANUFACTURING CO.,

Engine Department. TORRINGTON, CONN.

ICE CUTTING is easy with DORSCH ALL STEEL, DOUBLE-ROW ICE PLOWS. Marks and cuts two rows at a time; cuts any size cake and any depth, and does it with ease and economy. Does the work of 20 men sawing by hand. Pays for itself in two days. No farmer, dairyman, hotel man or other can afford to be without it. Have a supply of ice and enjoy the comforts of life in the Summer. Ask for catalogue and introductory prices. JOHN DORSCH & SONS, 212 Wells St., Milwaukee, Wis.

Made in Three Sizes.

tween the joists is filled in with cinders or some sort of material that will absorb the moisture and dampness and in this way prevent the decaying of the wooden joists. If you lay the boards on the old cement floor without any protection, your wooden floor will undoubtedly decay in places in a short time, but where it is raised above the cement, I think you will find a wooden floor will give good satisfaction.

COLD CURING OF CHEESE AND OTHER QUESTIONS.

"We are figuring on putting in a storage plant here and wish to put in a room or several rooms for curing cheese. Can you give us the proper temperature? Also explain how cheese should be handled when put into a cold room? How soon, after cheese are made, should they be put in storage? When should the cheese be paraffined, and what is the cost of handling cheese this way as compared with the old method of curing? Does the cold curing of cheese add greatly to its flavor and market value? Do you think we can make a success by turning creameries into factories for a few months in the summer time, by having a cheese making instructor visit and take charge of a number of such factories?

What do you think of handling separator cream by repasteurizing it after it is sour? Do you think that in a large plant where a great deal of churning is done, that it will be cheaper to take the cream out of the vats after cooling and heating and forcing it by compressed air over a cooler, than to run this ripened cream through a pasteurizer and to do the tempering in the pasteurizer? Will it not be better to run the cream through a continuous pasteurizer than to place it in a dozen small vats and try to change the temperature by stirring it in the vats?"

* * * *

Portland, Oregon.

It will be impossible for me to go into very great detail in regard to the questions asked in your letter. I shall, however, be pleased to give what information I may be able to write on these questions.

First. The proper temperature for curing cheese by the cold-curing process is near 40° F. We have found that by holding cheese at this temperature, within two degrees above or below 40°, for 6 months, that the flavor of the cheese and its texture are far superior to that of cheese cured for a short time at a high temperature, ranging from 60° to 90°. It has been found that cheese may be taken directly from the hoop and placed at this low temperature. They are usually paraffined, simply by dipping them in melted paraffine when taken out of the hoop, and then placed in the curing room at 40° F. We have no exact figures in regard to the cost of handling cheese in this way; that will depend a great deal on the cost of maintaining the temperature. In some places this will cost a great deal more than in others, according as a business concern has a surplus or a scant supply of storage room. The flavor and texture of cheese are certainly greatly improved by curing at this low temperature and both are much more uniform than is the case when cured in the old way. I think you can easily arrange to have such cheese made at creameries as you suggest, if a good cheese maker has the work in charge.

A condensed statement of the work which has been done on the cold curing of cheese is contained in the bulletin recently issued by the dairy division of the Agricultural Department at Washington, D. C. You can probably get a copy of this bulletin, by writing to Major Henry E. Alvord.

Second. The pasteurizing of sour cream will be a success I believe, if the sour cream is rich enough when it is heated. We have found that a thin sour cream testing in the neighborhood of 20 per cent fat, will not churn exhaustively. I have not been able to discover a theoretical or a practical reason for this fact up to the present time, but have noticed when we pasteurize sour cream testing under 30 per cent fat, that the butter milk often shows one-half per cent and even more, fat in it. We have not noticed the same thing when sour cream testing over 30 per cent fat is pasteurized. I do not think there will ever be any difficulty in pasteurizing sour cream. We have done it repeatedly this summer. It heats and leaves the pasteurizer in fine condition. There is, however, this point about the yield of high testing buttermilk, that has not yet been cleared up. I hope to do some work on it this summer.

BITTER BUTTER.

"Can you give me some information about butter making and farming in general? We are city people who have suddenly gone to farming and are having some trouble in our dairy. Our butter is bitter, so is the buttermilk, and our butter does not keep well. We have to churn some four hours in order to get the butter. Can you explain the cause of our troubles and help us to overcome them.

* * *

Milwaukee, Wis.

The bitter flavor that is often noticed in cream and butter is sometimes caused by holding cream at too low a temperature before it is churned. The bacteria which cause the bitter fermentations seem to develop rapidly in the cold and are noticed in the winter season more than in the summer. I think you can overcome the trouble you are having by holding the cream at a higher temperature and for a shorter time than it is being held now. If you will churn every other day and keep the cream always above 55° F., I think you will not be troubled by the bitter flavor either in the butter or the buttermilk.

The fact that you are obliged to churn four hours before the butter comes is another indication that the cream is too cold. Long churnings are nearly always caused by too cold and too thin cream. If you will arrange matters so that your cream will test at least 30 per cent fat and then ripen this cream between 55 and 65° F. until it develops about six-tenths of one per cent acid, then churn this cream at a temperature of 60°., I think you will find the butter will come in about three-fourths of an hour, and that the long churning and the bitter flavor will both be overcome.

If you have only a small herd of cows and most of them are in the latter part of their period of lactation, this cream from stripper's milk will also require an unusually long time to churn. You can help your churning a great deal by having your herd so arranged that the cows will not all be strippers at one time, but an occasional fresh milker will be coming in and this milk will so change the consistency of the cream that it will churn in a normal way.

TESTING SOUR CREAM.

Will you kindly advise me by return mail how I can test sour cream in ordinary cream test bottles? I have not had experience in this kind of testing.

* * * *

Portage, Wis.

The testing of sour cream is best done by warming the cream to a temperature of about 100 degrees, so as to soften the lumpy portions, and make it thin and limpid so that the cream may be uniformly mixed. If the cream is so sour that such heating separates the curd in the shape of hard lumps, you will find it necessary to pour this cream through a small wire strainer. When this is done and the lumps are caught on the strainer, they may be pressed through the wire, and gotten into a condition so that the cream will after a while become limpid and a sample can be taken from it with a pipette. It is very essential that the mixing should be thoroughly done, as any lumps of fat that are distributed through it will clog up the tip of the pipette when you come to measure it into the test bottle, and fail to be taken into consideration in the test.

It is a good plan also to add a small quantity of some alkali to the sour cream. The powdered alkali, which is usually called potash and sold at groceries in small cans, is a very good thing to use for this purpose. Too much of this powder ought not to be added to the cream; about one-fourth of the amount that would be held comfortably on a dime is sufficient to neutralize the acidity in a pint sample of cream. When too much of this alkali is used the action of the acid on the cream will be so intense that the fat will be somewhat charred and blackened. A reasonable amount of it, however, helps very materially in getting sour, lumpy cream into proper shape for testing. The only difficulty there is in testing sour cream comes from its lumpy condition; the fat is not changed in composition nor disturbed in any way by the souring. As soon as you are able, by means of heating and using a fine wire strainer, also a little alkali, to break up the lumps of curd and fat in the sour cream, and get the entire sample thoroughly mixed, you can go ahead with the testing in the same way that you would test sweet cream. E. H. FARRINGTON.

Trouble With Hairy Vetch.

ED. HOARD'S DAIRYMAN:—Can some of your readers tell why my Hairy Vetch does not seed, that is, mature seed in proportion to flowers and pods? All through May and until cut or dried down, the vines were one mass of purple blooms and flat pods, but very few filled out. The ground will make the vine and pod, now could I use some chemical to aid in forming seed? G. M. C.

Columbus, Ga.

THE CUTAWAY HARROW CO., HIGGANUM, CT., U. S. A.

An Ice House with Cold Storage.

ED. HOARD'S DAIRYMAN:—Will please print in your paper if you have space to spare, the plans of an ice house with a small cold storage room in it large enough to hold fifteen to twenty cases of eggs, besides a quarter of beef or a side pork or two. C. S. L.

Portage, Wis.

The following cut represents a section of a building with a room partitioned off in such a manner that it has ice on three sides and the top, and its floor is below

the surface a few feet in order to take advantage of the coolness of the earth. The double wall of the ice house extends in front of the open room and the door is protected by a porch. A shallow cellar under the floor of the ice house admits ventilation by the passage of cool air under the ice and thence off through a flue. The floor and ceiling of the room slope to secure the necessary drainage.—*Barn Plans and Outbuildings.*

New York Breeders' Meetings.

ED. HOARD'S DAIRYMAN:—The annual meetings of the New York State Breeders' Associations, held this year at Syracuse on December 16th and 27th, were quite as interesting and valuable to the attendants, as a whole, as formerly, though, on account of a fortunate selection of speakers by the sheep interest, that industry was rather better provided than any other. Still the dairy cow was not forgotten, especially as the paper of President Hoxie of the Holstein-Friesian Association was a most comprehensive one and would well merit publication as a whole, though quite long.

Some points made by Mr. Hoxie merit especial attention. For instance, he maintains that Holstein milk at a percentage of 3.55 butter fat, is richer than that of the human mother, thus sustaining that it is the best cow's milk for feeding infants and children, and also that it is just as easily separated from the milk as in case of a greater proportion of it. Hence, it is of no account, so long as the desired amount of fat is present to make the milk sufficiently profitable. Noting how greatly England is taking to this milk and butter he declared that so much of this butter had been taken from Holland in a single year that it amounted to more than 200 pounds to the cow the country over.

Quoting Prof. Roberts of Cornell, at length, he finds the latter saying that the Holstein beef he obtained in London tasted to him better than that of the famous English Short-horn cattle. The theory that the Holstein fat is laid on the ribs and muscles and not about the kidneys and intestines, as in case of some dairy cattle, is made the basis of a suggestion that it is a sufficient explanation of the reason for all differences between the Holstein and other dairy breeds as beef producers. He does not say that such is the reason, but asks if it is not.

The Hollander has kept his herds so good because he takes his surplus animals to market to sell and sells what he does not care to keep, whereas it usually happens that the buyer goes to the herd direct and picks out what he wants. Considerable space was given to a description of the Holstein cow at home and of the way the milk and its products are handled.

In a racy address on the selection of Sire and Dam, James Wood, of Mt. Kisco, maintained that it was the constant reversion to the old established type of any animal that established its excellence. If it was found necessary to go outside for something else wanted, the old cross should follow at once to fix it. There were dangers of too close inbreeding, but they could be avoided. Referring to the attention paid to dairying in the Danish districts, he said that Denmark was sending its butter all over the world. He had found it away up the Nile and in Mexico. In fact, it was the only butter that would stand shipment into the tropics. England, he said, still clung to the Short-horn cow and made her a leading dairy animal. It was asserted by another speaker that a good breeder could so modify and mould animals that any Short-horn herd could be transformed into a fine dairy herd in 25 years. And so England milked the Short-horn, in spite of the preference of Scotland for the Ayrshire and of the presence of the other dairy herds every where in Britain.

Secretary Caldwell, of the American Guernsey Cattle Club, told of the Guernsey at home in the Channel Islands, where she was always a pet and had been kept without change of momemt, from the cow of far older time. But the Guernsey is now raised away from her native home to a great extent, as Guernsey is found too valuable as raiser of flowers and plants for the London market.

The Jersey Cattle Club of Western New York invited Director Jordan of the Geneva Experiment Station to read a paper before it, but he chose his favorite theme of feeding and did not go into dairy specializing to any great extent. He held that we are generally feeding our stock too much protein and showed that as the great crops of the country begin with hay they are of first importance. Another speaker had said that the crop was but the rough material and only the beginning of agriculture, so it followed that feeding was the equally important part, especially as a second opportunity to make a profit, was afforded by feeding out the crop, not to mention the fact that the farm is enriched in that way, while it is impoverished by selling the crop out right.

One of the sheep lecturers declared that he could double the productiveness of a farm in 15, if not in 10, years, by feeding animals on it and that only one-fifth of the nutriment was taken out of any food by the animal.

Milo H. Olin of Perry, a well known breeder of Jersey cattle, was re-elected president of the Breeders' Association. By virtue of this office he is made one of the State Fair commissioners, of which there are eleven. JOHN CHAMBERLAIN.

New York.

CONCERNING OUR ADVERTISERS.

"SURE HATCH CATALOGUE"

Our new 1904 catalogue is now ready for mailing. No poultryman or fancier should be without this valuable book. It is beautifully illustrated and gives dozens of photos of the machines in actual operation in the hands of the people in all parts of the country. The incubators and brooders are described fully in every section, and in addition this book contains sound poultry sense. Send for one; they are free. SURE HATCH INCUBATOR CO., Clay Center, Nebraska, and Indianapolis, Ind.

ABOUT GOOD SEEDS.

The successful planter owes his success mainly to sowing good, fresh seed. He knows the value of buying the home-grown product direct from the reliable grower. The well-known seedmen, James J. H. Gregory & Son, of Marblehead, Mass., have for nearly half a century sustained the reputation among planters, farmers and gardeners throughout the country of producing and selling only fresh, pure and reliable seed; a reputation founded not merely upon growth, selection and care of the seed stock, but also on the purity and thorough reliability of the seed raised from it. These famous seeds are sold under three guarantees, which proves the sincerity of the growers while they insure safety to the planter. Messrs. Gregory & Son are sending out their annual catalogue for 1904, which contains many new improved varieties in vegetables, small fruits and flowers, and a vast number of farm and garden facts, which should be of great utility to every one who plants seed. This valuable book will be sent free for the asking.

THE JOY OF OWNING A GUN.

"A boy gets out of owning a gun all the joy there is in it," says a well known writer in the Illustrated Sporting News. "There are mighty few pleasures, anyway, that a man can have that a boy does not have on a smaller scale, but more intensely. Some boys are hungrier for guns than others—that is partly a matter of what there is handy to shoot—but I never knew a boy who did not want a gun, and did not delight in it when he got it. It is not because of any innate murderousness in the boyish disposition, but merely because the gun means power, suggests the relaxation of apron strings and is an exceedingly important and interesting piece of mechanism." Such opinions have been offered by writers the country over. The movement for this "gun education" of the American boy was begun by the J. Stevens Arms & Tool Co., of Chicopee Falls, Mass., makers of the famous "Stevens" firearms. The catalogue of this company is a mine of information on gun owning and makes excellent winter night reading for grown-ups as well as for the boy. It will be mailed free.

WHAT IS GEORGIA DOING?

The attention of the public has recently been attracted by frequent advertisements of Georgia and its resources, and a great many wonder what this means. It seems to be the forerunner of a new movement of people on this continent, similar to that which occurred in Europe. The northern part of Europe filled up with people of the Aryan stock and then they began to go south. In a comparatively short time they overrun France, Italy, Spain and the British Isles. For nearly a century there has been a rush of people from the Eastern States and from foreign countries to the western part of this continent. First the upper part of the Ohio Valley was filled, then States farther west, and so on. The rush to the West naturally raised prices of land, and now it has come to pass that young men looking about for cheap farms must look to the extreme West. Of late some of them have begun to talk about the South, particularly Georgia, where the climate is fine and the people are enterprising. The Georgians are hospitable and give a warm welcome to good citizens from any quarter and the northern people now living there are delighted with their surroundings and enthusiastic on the climate and natural resources. The Greater Georgia Association has in press a little volume composed entirely of letters from northern people who have settled in Georgia and done well there. This list will be sent free to anyone on application, by Mr. W. G. Cooper, the secretary, whose office is in the Atlanta Chamber of Commerce. The Association will also send, upon request, an illustrated booklet which describes in a concise but practical way the resources and products of the State.

There will be a meeting of the Guernsey cattle breeders at the State House in Indianapolis, Ind., 1 p. m., Jan. 7th, 1904, for the purpose of organizing a Guernsey Cattle Club of Indiana. Every owner of a Guernsey is requested to be present.

VETERINARY.

Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

Injecting for Abortion,

In treatment for abortion (page 879, Dec. 4th) is it safe for an amateur to attempt inserting the point of the syringe into the womb. In treatment of a large number of cows, if he were mistaken in diagnosis, and treated one that had not aborted, would this cause abortion? C.

Nashville, Tenn.

ANSWER.

If a cow is pregnant, it is decidedly dangerous to attempt to introduce a syringe into the uterus as it is very apt to produce abortion as well as other complications. Therefore you should make sure that the cow had aborted before injecting.

Wire Cut.

I have a young mare that got her right hind foot caught in a barb wire fence about six weeks ago. Have had a veterinary treating all the time but it is now still quite sore. The cut is in the back side of the foot and the leg is swoolen up to the hock. H. S,

Wyandotte, Mich.

ANSWER.

Wash the parts clean with castile soap and warm water, then apply the following lotion:

Sulphate of zinc, 1 oz; sugar of lead, 6 dr's: rain water enough to make a pint. Shake well and apply twice daily after washing.

Excessive Thirst.

I have a cow to come in fresh Dec. 24, that drinks an enormous amount of water, about 150 pounds. I give her a teaspoonful of salt night and morning. Is it well to take the salt from her? She don't seem to feel well after drinking. O, S. S.

West Denmark, Wis.

ANSWER.

It is advisable to limit the amount of water given to a nominal quantity and

GIVE YOUR STOMACH A NICE VACATION.

Don't Do It By Starving it Either—Let a Substitute Do the Work.

The old adage, "All work and no play makes Jack a dull boy," applies just as well to the stomach, one of the most important organs of the human system, as it does to the man himself.

If your stomach is worn out and rebels against being further taxed beyond its limit, the only sensible thing you can do is to give it a rest. Employ a substitute for a short time and see if it will not more than repay you in results.

Stuart's Dyspepsia Tablets are a willing and most efficient substitute. They themselves digest every bit of food in the stomach in just the same way that the stomach itself would, were it well. They contain all the essential elements that the gastric juice and other digestive fluids of the stomach contain and actually act just the same and do just the same work as the natural fluids would do, were the stomach well and sound. They, therefore, relieve the stomach, just as one workman relieves another, and permit it to rest and recuperate and regain its normal health and strength.

This "vacation" idea was suggested by the letter of a prominent lawyer in Chicago. Read what he says: "I was engaged in the most momentous undertaking of my life in bringing about the coalition of certain great interests that meant much to me as well as my clients. It was not the work of days, but of months. I was working night and day almost, when at a very critical time my stomach went clear back on me. The undue mental strain brought it about and hurried up what would have happened later on.

"What I ate I had to literally force down and that was a source of misery as I had a sour stomach much of the time. My head ached, I was sluggish and began to lose my ambition to carry out my undertaking. It looked pretty gloomy for me and I confided my plight to one of my clients. He had been cured by Stuart's Dyspepsia Tablets and at once went down to a drug store and brought a box up to the office.

"I had not taken a quarter of that box before I found that they would do all the work my stomach ever did; and as a rest or vacation was out of the question for me, I determined to give my stomach a vacation. I kept right on taking the tablets and braced up and went ahead with my work with renewed vigor, ate just as much as I ever did and carried out that undertaking to a successful issue. I feel that I have Stuart's Dyspepsia Tablets to thank for saving me the handsomest fee I ever received as well as my reputation and last but not least my stomach."

Stuart's Dyspepsia Tablets are for sale by all druggists at 50 cts. a box.

U. S. Agents. Box 365.

omit the salt for awhile. The trouble will likely subside when she comes fresh.

Abscess.

I have a registered bull calf that bloated on alfalfa in Sept., I tapped him with my pocket knife and he seemed to be all right for a while, but in the course of a week or ten days I noticed it had caused a sore and was discharging a very offensive smelling matter of a yellowish color. washed it with a solution of carbolic acid and it apparently got well. But I notice a lump there now, nearly as large as a hen's egg, and when I take hold of it, he flinches as if it were painful. W. C.
Juliaetta, Idaho.

ANSWER.

The bunch is the result of an abscess, which is liable to form after tapping with a knife. If it does not disappear of its own accord, it may be dissected out, but usually they are not harmful and in many cases will disappear without treatment.

Ophthalmia.

I have 20 head of calves from 3 to 6 months old that have some eye disease. They first get sore in one eye. In a short time there is a white film forms over it, and soon after, the other eye is affected the same, with some of them. Some of them are nearly blind. G. C.
Cordelia, Cal.

ANSWER.

Your calves have a form of ophthalmia which requires the attention of a qualified veterinarian, especially so if the disease threatens to become epidemic.

Thorough Pin.

I have a valuable colt that started a thorough pin while being broken. C. L. D.
Madrid, N. Y.

ANSWER.

Apply a smart fly blister of ¼ strength. Rub once daily for three days and do not wash off, but allow the scabs to drop off of their own accord. Keep the colt tied short to that he can not reach the leg with his mouth. If this does not reduce the enlargements sufficiently, the above may be repeated in a month.

Disinfection for Pneumonia.

My cattle had last winter what the State Veterinarian called lobular pneumonia. We lost several head, the rest we disposed of in October. Will there be any danger in my putting cattle in this same barn where those cattle were last winter, if I thoroughly disinfect? What is best for a disinfectant? If there is any danger will young stock take the disease quicker than older ones? J. A.
Village Creek, Ia.

ANSWER.

If you thoroughly disinfect the premises and stable there ought not to be any danger in the future. We would advise to whitewash all the stables and add to each bucket of prepared whitewash a dram of bichloride of mercury. Thoroughly cleanse the floors and cover them with a thin layer of slacked lime.

Loose Horn.

Will you please advise me what to do for a year old Jersey heifer with one of her horns loose from her head and moves with the skin. A neighbor tells me it will have to be removed.
Brooklyn, Wis. A. P.

ANSWER.

The heifer has evidently loosened the horn by fighting with other cows or heifers. It is not dangerous, nor will it require an amputation as they usually grow on without treatment, unless it is so loose that it will hang down of its own weight.

Bloating.

Please give remedy for bloating in cattle, I have one cow that seems to be ravenous and she cannot eat much hay without being bloated and in distress, W. H. P.
Petersham, Mass.

ANSWER.

Bloating is a sign of indigestion. Feeding all she may eat (if she is a natural glutton) may be the cause.

Avoid overloading the digestive organs, and give the cow an ounce each of hyposulphite of soda and powdered ginger in food twice daily for a week or two.

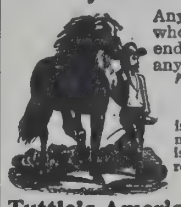
Eczema.

I have a Jersey cow 3½ years old, has been milking now for thirteen months. She is 6½ months with calf. She has done very well until the past three months. She has hard places on her udder just above teats, some of them come to a head, while others seem to disappear.

I was very much interested in your answer to "Subscriber" from Los Angeles, Cal., in your issue of November 6th. My cow's symptoms being somewhat similar, except that she never has been caught trying to drink her urine, nor has she been seen recently eating dirt, and when she did I thought same to be the want of salt, as at the time I was giving her only rock salt.
Macon, Ga. C. E. H.

ANSWER.

Judging from your description your cow has eczema. Keep the bowels open with a full dose of Epsom salts, once or twice a week, and give two tablepoonsful of Fowler's solution of arsenic in food twice daily.



"SAVE-THE-HORSE"
Registered Trade Mark
SPAVIN CURE
BEGIN TREATMENT AT ONCE!
HAVE A PERMANENTLY SOUND HORSE FOR SPRING.

Cured horses are absolute certainties as to the possibility of the remedy for your own case. Such results as shown in our booklet, by business men whose reliability can be readily ascertained, have carried **"SAVE-THE-HORSE"** over skepticism, prejudice and uncertainty. Send for booklet and copy of written guarantee, which is as binding to protect you as the best legal talent could make it. No man need see his horse suffer and become incapacitated.

GEORGIA Lands Grow Everything

GEORGIA offers the greatest opportunities to settlers and investors to be found in America to-day. It has been overlooked in the rush to less favored but better advertised sections. It is the ideal place for Northern farmers and their sons to locate. Grows all kinds of crops, make permanent and profitable homes, and all at a very moderate cost. The climate of Georgia is perfect, neither too hot nor too cold and is diversified as the land rises from the sea-level to an altitude of 5,000 feet. No blizzards, or violent extremes of weather. The best climate, in fact, to be found anywhere on the continent, for health and comfort with profit. Coal is cheap and abundant, educational and church advantages the very best, water plentiful, transportation facilities good. More than one-half the deposits in State Banks are owned by Georgia farmers.

LANDS in the most desirable sections of this wonderful state can be purchased on long time and at far lower prices than are asked in northern states. There is no more beautiful or fertile land outdoors than Georgia possesses in abundance. Ten months in the year there is open pasturage for cattle. So rich and fertile is the soil, so early and convenient the market, that farms here yield annually 40 per cent of their valuations. Failure of crops is almost unheard of in the entire state of Georgia, and where diversified crops are grown nothing like an unprofitable year was ever known. No better opportunity exists for poultry and dairy farming, cattle, hogs and stock breeding generally. Small fruits and in fact all fruits grow to perfection. GROW any crop here that grows in *your* state, and others that you cannot grow to profit. Ten cent cotton is like dollar wheat. Georgia peaches sell for millions. Finest grasses and open pasturage ten months yearly make dairy farming and cattle raising profitable. Don't misjudge Georgia just because you know little or nothing about it. *Find out.* Lay aside any prejudice you may possess and ask for facts, and then investigate for yourself.

Write GREATER GEORGIA ASSOCIATION, Atlanta, Georgia, and they will tell you

An Iowa Inquiry and Report.

ED. HOARD'S DAIRYMAN:—Will you give us a balanced ration from the following in your next issue: Bran, $17.50 per ton; oil meal, old process, $24; barley, 34 cents per bushel; corn, 35 cents per bushel.

We grind the corn with cob, also grind the barley ourselves. Bran and oil meal we can get at the elevator at the above prices. Would it pay us to sell the barley and buy bran and oil meal?

We began dairying one year ago last November 5. At that time we bought the cream of two herds—16 cows in all. During the year ending Nov. 5, we made 4,160 lbs. butter, which averaged us 20 cents per lb., retailing it in Belle Plaine. This gives us $52 per cow, besides the skim milk and cream for a family of 7.

We expect to make our cows bring us $75 per cow or more a year, by selling off the poor ones and buying others, and raising the heifers—thanks to HOARD'S DAIRYMAN which is our teacher.

Belle Plaine, Iowa. R. BROS.

It is not practicable to set forth a ration formula unless one knows what roughage is available. Have you silage and clover hay, or timothy hay and corn stover? In the former case you could feed a mixture of bran, barley and corn and cob meal, but without silage and clover, oil meal would be indicated to take the place of a part of the barley and corn.

Your report for the first year is most encouraging, and your plans for the future point in the right direction.

Value of the Manure Spreader.

ED. HOARD'S DAIRYMAN:—The manure spreader is not an implement of very recent production, as might be judged by its growing popularity and the extent of its recently being advertised. Its day was pretty slow in coming, but it has come as fully as it has suddenly. Its place on the best conducted farms is as established as that of any of our other indispensable farm implements. But in a great many of our farms the places are not filled, and alongside the empty places are many needs for their filling.

This may read very much like a manure spreader advertisement, and so it may be considered, but from the standpoint of the farmer and not that of the sellers of spreaders. I have no interest in the selling of spreaders, but as an agricultural teacher, I have in the farmers using them, for I know that by the use of this machine, the farmer will get much more value from the manure, both by reason of his ability to make a given quantity cover more land and to get it more readily and completely incorporated with the soil. Frequent light dressings of manure produce better results in crop growing, than less frequent and heavier coats.

In the light dressing, the roots of the plants appropriate the food elements as fast as the elements become available. The soluble parts in the heavier applications may leech away during times of excessive rain-fall, and part of them be lost. Translocation of active potential plant foods in the soil is very little so that the plant to use the food, must go after it and come in contact with it.

Thus the more the manure is divided and broken up, the more points of contact for the feeding roots and the more quickly as well as completely it nourishes the crop.

The ownership of a manure spreader, is an earnest that the farmer is more fully appreciating the value of the manure, and following this will come his more careful saving of it, and this one item alone will make the purchase of the spreader a highly paying investment.

The consideration of the labor-saving functions of the machine is one we farmers cannot afford to ignore, for the scarcity of laborers makes labor higher priced and in many cases compels us to use that which is less efficient than we desire.

Therefore, as a demand of farm policy, we must make the work as easily performed as posible and by the use of implements of expedition, reduce the cost of labor by increasing its output,

Penn. W. F. MCSPARRAN.

A Query Concerning the Indiana Cow Census.

ED. HOARD'S DAIRYMAN:—May I ask if Nos. 21 and 29, grade Holsteins, in cow census report on page 967, have not a good sprinkling of Jersey in them? We have a herd of mostly Jerseys, some 20 odd in number, and I believe we could make a better showing than any of these men, unless it be the numbers above referred to. As we are about starting another herd I want the best. Am selling butter fat. J. W. K.

Erie, Mich.

The presumption is that the cows in the herds mentioned had no appreciable infusion of Jersey blood. If they had that fact would have been mentioned. But one must not take these figures as settling the relative merits of the breeds represented, for the man behind the cow is a most important factor. A careful reading of the comments accompanying the tabular statement explains a good many of the discrepancies found in the table. As regards breeds, all experience shows that a man does best with that particular breed, which best pleases his fancy, provided they are of good dairy type.

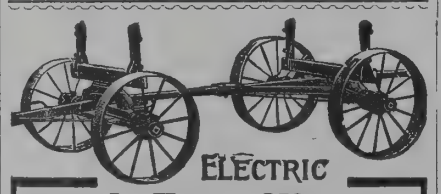
The Polk County Land & Loan Company

For Choice Red River Valley Farms. They pay railroad expenses if you buy from them. A few good bargains.



360 acre farm, 4½ miles from Crookston, Minn., a city of 7,000 inhabitants, and 2½ miles from the State Experimental Farm. This is a photograph of the buildings as they are today: House is 16x24 1½ stories with an L 14x22, and a wood shed in connection 20 feet square, all on a brick foundation. Barn 28x48, with a lean to 16x48, sheeted both inside and out. Two granaries, one 14x80, and the other 14x42. The buildings are all well painted and in very good repair, and has a fine artesian well. Every acre of this farm is under a high state of cultivation, and is well drained by a slight ravine running through the farm merely sufficient for self drainage. The soil is a rich, deep black loam with a clay sub-soil, and in every respect is considered to be one of the best farms in that vicinity. Our price on this farm is $35.00 per acre.

This is a **320** acre farm about 2½ miles south of the city, this farm is quite well improved, has a very good house of about seven rooms, 1½ stories, barn large enough for ten head of horses, also a good granary, pasture and an artesian well, also has a good well at the house, good grove around the building. This is a very choice piece of land for the price $32.50.

160 acres north-east of the city; this is all hay land, and located in a German settlement, the surrounding country is nearly all under cultivation; we consider this a good piece of land for an investment, this could all be put under the plow, if desired. Price $18.00 per acre.

Structure and Capacity.

How to Breed Dairy C tle.

[Paper by SECRETARY WINSLOW, read at the Albany meeting of the Ayrshire Association.]

There is an inherent ability in cattle to produce from the same kind of food either flesh or dairy product, and while it is probable that in the far past the cattle of a given section were uniformly of the same type and characteristics, and probably bred true to that type, the same as do wild animals, yet when the hand of man began to utilize them for his needs, they began to take on changed form and characteristics in response to the efforts of their owner to conform them more and more to his ideas of what would be the most for his own benefit in supplying his daily wants. Thus, the natural law of selection changed some into beef producers, and others into dairy producers; but with every change of ownership there was likely to be a change of purpose in their management, and while all were more or less useful, there was little marked diversity until later enterprise, with concerted action, began to form fixed types for the highest production of either beef or dairy products.

While it is true that certain exterior structural characteristics seem, as a general rule, to produce the same results in a desired product, it is also true that this given line has not been followed long enough in either direction so firmly to fix the type, as to enable a breeder to feel certain as to what he may produce from any careful coupling of his cattle; so that while we may reasonably hope that by the uniting of like we can hope for a like result, we are not sure, because none of our cattle have been bred in that line long enough to eliminate a tendency to scatter or take back to some of the varied ancestry from which they sprung. But the longer a breeder or successive breeders pursue the same course, the less likely is there to be disappointment in the offspring of judicious coupling of animals possessed of similar structure, and descended from that same type. While we have various so-called breeds of cattle, there are two distinct divisions which might be laid down, dividing them into two classes--the producer of beef, and the producer of dairy products. We find structural differences in the highest type of each, which indicate inherent capacity, and we find, as a rule, that irrespective of breeds, the same structural difference is followed by the same comparative difference in the result.

Take the animals of the highest type of beef production, we find that all their parts that are non-essential are eliminated, or reduced to a minimum—head small and bony, horns either entirely gone or of small size, bones small and of fine texture, neck short, back and ribs compact, and closely set together, and in fact, the whole structure put together on the most economical plan of saving everything and losing nothing, and the body, as you look at it standing, presenting the form of an oblong square box, simply leaving out the head, neck and legs. The beef animal might be called a miser, hoarding up all its gains, and giving up nothing except with the surrender of life, often not even giving milk enough to raise its own offspring, while on the other hand the highest type of the dairy producer, as we find in all breeds, has a comparatively uniform structure that in most parts is directly the opposite from the beef producer, but with the non-essential parts quite similar--head small and bony, horns small, bones small and of fine texture, neck long and slim, with strong junction with the head, clean throat, shoulders light and thin, withers sharp, with backbone rising above the blades, ribs arching out and swelling immediately after leaving the shoulders, giving abundant room for the heart and lungs, and the whole formation of ribs gradually enlarging to the hind quarters, giving plenty of room for food; the ribs being wide and flat, and with considerable space between them. The backbone is strong and corrugated, showing a looseness to the touch, hips wide, pelvic arch high, rump bones wide spread, tail long and slim, flanks high and arched, open between thighs and in-curving, giving plenty of room for the udder, legs short, bones flat, udder capacious, running well forward and back, with the four quarters, of uniform size, teats of medium length and of good size, and uniform from udder to end, placed wide apart at the four corners of the udder; milk veins large, long and tortuous, entering the abdomen through one or more large holes on each side the veins, and holes on either side being equal in size and length. Color conforming to requirements of the breed.

I have left out the distinctly breed characteristics, as the animals in all breeds that have made themselves famous, had almost uniformly the same structural make-up, indicating that there was a uniform build that in itself denoted ability to produce either beef or dairy product.

In studying the outward form of the cows of all breeds that have given the highest yields at the dairy, you will find them lacking in that shapeliness ascribed to the beef animal, and which to a beef breeder would be considered homely and ill-shaped.

It has always seemed that the breeder of dairy cattle was trying to obtain the highest results at the pail from a beef type and let go the straight contour of the beef producer with the greatest reluctance.

It is almost proverbial that a great producer in the dairy breeds stands no show in the ring, beside her more shapely sister of the best beef type, in winning the ribbons which should denote superiority. I have heard our Canadian cousins, in the ring, condemn a crumpled horned Ayrshire cow, regardless of her milking appearance, because her horns were not

The Trying Time

In a young girl's life is reached when Nature leads her uncertain steps across the line which divides girlhood from womanhood. Ignorance and neglect at this critical period are largely responsible for much of the after misery of womanhood. Not only does Nature often need help in the regular establishment of the womanly function, but there is almost always need of some safe, strengthening tonic, to overcome the languor, nervousness and weakness, commonly experienced at this time.

If there is an invalid woman, suffering from female weakness, prolapsus, or falling of womb, or from leucorrhea who has used Dr. Pierce's Favorite Prescription without complete success, Dr. Pierce would like to hear from such person—and it will be to her advantage to write as he offers in perfect good faith, a reward of $500 for any case of the above maladies which he cannot cure.

"I wish to tell you the benefit we have received from using your remedies," writes Mrs. Dan Hall, of Brodhead, Green Co., Wis. "Two years ago my daughter's health began to fail. Everything that could be thought of was done to help her but it was of no use. When she began to complain she was quite stout; weighed 170, the picture of good health, until about the age of fourteen, then in six months she was so run down her weight was but 120. She kept failing and I gave up, thinking there was no use, she must die. Friends all said, 'You will lose your daughter.' I said I fear I shall. I must say, doctor, that only for your 'Favorite Prescription' my daughter would have been in her grave to-day. When she had taken one-half bottle the natural function was established and we bought another one, making only two bottles in all, and she completely recovered. Since then she is as well as can be."

FOR THE PROFIT THERE IS IN IT

You must make your butter the best possible if you would command the highest price.

Colonial Butter Salt

AND

Liberty Butter Salt

"MONEY MAKERS FOR BUTTER MAKERS"

Are freely credited, by the creameries who use them, with improving the quality of the butter over any other salt, being perfect in flavor, color, and purity, lighter and drier than any other, dissolving more quickly, preventing danger of streaked or mottled butter, while it is safe to work the butter less with these salts than with other makes. Regarding our two brands,

COLONIAL Butter Salt is a light, flaky grain, the lightest for the same bulk that there is on the market. While other makes use a barrel with but a 30 inch stave and a 19 or 20 inch head to hold 320 lbs., Colonial requires a barrel with a 34 inch stave and a 21 inch head to hold the same weight.

LIBERTY Butter Salt is granulated, every grain of the same size and perfectly square; contains one-tenth of one per cent. moisture, so it, as well as the Colonial brand, has the "make weight" feature. It is a little coarser in grain than any other granulated salt, which is a decided improvement, and because of its uniform grain it dissolves evenly and does not leave the butter gritty or mottled.

Send for Free Sack

of either or both these brands. Your request on a postal card will assure the prompt delivery to creameries and cheese factories only, without cost, a 56 lb. sack of either or both. Let us know your success with it after trial.

COLONIAL SALT COMPANY, AKRON, OHIO.

CHICAGO OFFICE.....84 ADAMS STREET

characteristic of the breed, and should be upright.

The highest excellence of a dairy cow is her capacity to give the largest dairy product from the least food consumed, and when you study the outward formation of the great producers you do not find them having large horns or straight backs. While you may now and then get a fairly good product from a cow lacking in one or more of the dairy characteristics, still it is the exception, and inbreeding should not be encouraged. Perfection in all those points that in themselves fit the cow to do her highest work, should be encouraged, and those points which are not found in cows doing the highest work should be discouraged.

Constitution is the foundation of excellence, because without it the best of other points are useless. By constitution in a dairy cow I do not mean that she shall be like a beef animal, any more than I would require a running thoroughbred to have the form of a Clyde or a Percheron. I have heard it said that you must have width between the fore legs of a dairy cow, to insure constitution, but which has the stronger constitution to endure a hard strain, the race horse or the draft? Which has the stronger constitution, the dairy cow thin in the withers and light in the shoulders, that can produce ten times her weight in milk during the year, and half her weight in butter, or the beef cow that can in two or three years of her lifetime produce half a ton of meat?

Perhaps the next point in importance is the inclination and ability to consume and digest a large amount of coarse fodder. Then follows the perfection of udder and milk development, and while we would allow a material departure from straight lines in shape of the dairy cow, her udder should, when young, have a good degree of conformity to straight lines, because, other things being equal, the squarer and straighter the udder the greater the capacity, and the lines of beauty are here the signs of utility.

Our interests here today centers in the Ayrshire breed of cattle, and it is for us to inquire how we may breed the Ayrshire cow so as to have her constantly progressing in ability to produce a large amount of dairy product of good quality, at a minimum cost. It is only recently that any concerted action has been taken to find out what was really her dairy ability, and while we have not as large a number of cases as we could wish to allow us to compare the form with the dairy result, we have a few; and as far as I have been able to observe, the same rule holds true in Ayrshires as in other breeds, as to the dairy form that excels at the pail, and as you depart from that form the yield as a rule decreases.

The question for Ayrshire breeders to decide is whether they will hold to the Ayrshire model as laid down by Scotch breeders for the show ring, or will change somewhat the ideal type as laid down in the scale of points, and allow a more decided dairy type to be the standard of excellence. Are the breeders of Ayrshires to stand still and keep the standard of the Ayrshire cow at a medium grade, or are they ready to push her to the front as a producer?

There is a limit to the product almost in proportion to her shapeliness as laid down in the scale of points for the show ring. The question is, are you breeding show Ayrshires or dairy Ayrshires? The scale of points as issued by the association is supposed to be the standard of excellence and the rule to guide breeders. Now let any breeder go through his herd and keep a careful record of the dairy yield and compare it with the perfect type as laid down in the scale of points, and see where it lands him. Are the cows that scale the highest the ones that pay the best? Every breeder should, as far as he is able, have his herd close to the type of the breed, and which shall he sacrifice, looks or utility? If the scale of points is not such as will encourage breeding Ayrshires of the highest utility, then the scale should be changed so as not only to allow but to encourage breeders to develop the highest type of a dairy Ayrshire.

The photograph of noted Ayrshires at the pail, both in Scotland and here, indicate that the greatest dairy yields come from a different looking cow from the one you usually see led into the show ring, a cow of more distinctively dairy type.

I saw two imported Ayrshire cows at the Experimental Farm at Ottawa, and the record of the dairy type was far ahead of the show type. There is no good reason why there should be such a scarcity of 10,000 pound Ayrshire cows, and if breeders would pay more attention to the dairy type of their Ayrshire cows the 500-pound cows would be more plentiful.

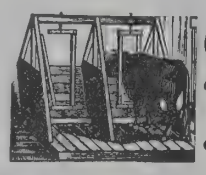
I see no good reason why our American breeders of Ayrshires should follow after the Scotch type of large horns and small teats. If the Ayrshire breeders of Scotland have departed from the original type of their breed, that about the time our early importations were made, and from which the best Ayrshires of the United States and Canada have descended—I do not see the wisdom of our following their lead, especially when it gives us poorer dairy cows, because removed from the standard dairy type that excels in milk production.

Cost of Shredding Corn Fodder.

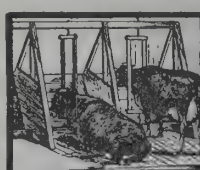
ED. HOARD'S DAIRYMAN—The boys shredded 10 acres of heavy fodder last week and I give the readers of the DAIRYMAN the cost of the operation:

Three men and teams at $2.50, 1½ days	$11.25
Two men in field at $1.50, 1½ days	4.50
One man at crib at $1.50, 1½ days	2.25
Engine and two men	10.00
Board of men	3.00
Coal	4.50
Total	$35.50
By 425 bu. of corn husked at 3c per bu	$12.75
By 25 tons of fodder at $2 per ton	50.00

We yet have the manurial value of the stalks that is not accounted for, but that will offset the cutting of the fodder in the field. Besides, we have the satisfaction of knowing we are saving a feed that is relished by all of our farm animals, and are sure that the feeding of it will not result in the death of our stock. I find in traveling over the corn belt this fall that there was but a very small amount of fodder cut up. This was owing to the great amount of hay raised and the good pastures. At the same time the farmers would have been well paid in cutting up their fodder. They could have their hay crop to sell, and at the same time their fields of corn would be in much better condition to crop another year. I visited the farm of a progressive farmer in Scott county this fall, and he informed me that he could husk his corn as cheaply with the shredder as he could in the usual way and he had the fodder clear of expense. His statement was backed up by the figures.



When one attends farmers' institutes and conventions weekly for five or six months, he is sure to learn a great many things, good, bad and middling. I caught on to a good thing, last week in Henry county of this state, and as there is no patent on it I will give it to the DAIRYMAN readers who are in the milk peddling business. The good thing was a milk cooler and aerator combined, and there was an attachment that made the pump of but little use, which is worth making a note of. The device consisted of a shallow pan with a spout at one edge to conduct the milk into the cans, and on this pan a large cake of ice was placed over which the milk was allowed to drip. The only kick the user of the device had was it took too much ice. Now, as but few of the milkmen I know are kickers I do not think a little thing like that will bar their using this new aerator and cooler.



I watched for a barn that had windows enough in it on my recent trip to Iowa, and in the 195 miles I did not see one such. How strange! I would like to have the reports of creamery patrons that are given in the DAIRYMAN contain the

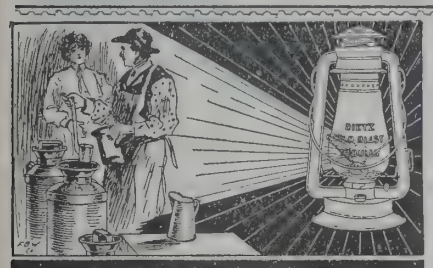
THE VALUE OF CHARCOAL

Few People Know How Useful It Is in Preserving Health and Beauty.

Nearly everybody knows that charcoal is the safest and most efficient disinfectant and purifier in nature, but few realize its value when taken into the human system for the same cleansing purpose.

Charcoal is a remedy that the more you take of it the better; it is not a drug at all, but simply absorbs the gases and impurities always present in the stomach and intestines and carries them out of the system.

Charcoal sweetens the breath after smoking, drinking or after eating onions and other odorous vegetables.



Charcoal effectually clears and improves the complexion, it whitens the teeth and further acts as a natural and eminently safe cathartic.

It absorbs the injurious gases which collect in the stomach and bowels; it disinfects the mouth and throat from the poison of catarrh.

All druggists sell charcoal in one form or another, but probably the best charcoal and the most for the money is in Stuart's Absorbent Lozenges; they are composed of the finest powdered Willow charcoal, and other harmless anti-septics in tablet form or rather in the form of large, pleasant tasting lozenges, the charcoal being mixed with honey.

The daily use of these lozenges will soon tell in a much improved condition of the general health, better complexion, sweeter breath and purer blood, and the beauty of it is, that no possible harm can result from their continued use, but on the contrary, great benefit.

A Buffalo physician in speaking of the benefits of charcoal, says: "I advise Stuart's Absorbent Lozenges to all patients suffering from gas in stomach and bowels, and to clear the complexion and purify the breath, mouth and throat; I also believe the liver is greatly benefitted by the daily use of them; they cost but twenty-five cents a box at drug stores, and although in some sense a patent preparation, yet I believe I get more and better charcoal in Stuart's Absorbent Lozenges than in any of the ordinary charcoal tablets."

You Don't Guess

about what you are doing, but you see as with the light of day if you use the

Dietz Cold Blast Lanterns

noted everywhere for their even shedding of pure white, strong, steady light. Burn on the cold blast principle. Most convenient, give most satisfactory light, safest lanterns made. Don't confound them with common lanterns which smoke, flicker and blow out. Let us send you lantern book to make a selection, then you can buy it from any dealer or have him get it for you.

R. E. DIETZ COMPANY, 94 Laight St., New York.
Established 1840.

SILO SENSE

presumes the use of the modern round silo. They are the cheapest and best, and preserve the silage better than all others. There are no angles or corners to admit the air and cause the silage to mold or rot. We make them in four styles and 200 sizes. Made of Cypress, White Pine and White Hemlock. Anybody can set them up. We also make a full line of Ensilage and Fodder Cutters, Tread Powers, Wood Saws, Threshers, Engines, etc. Send for Book on Silos and Ensilage. Mailed free.

HARDER MFG. CO., Cobleskill, N. Y.

Gertie's Sister 151594—Sire, Fairview Prince 43904; dam, Girletta 61472, Butter, 14 lbs., 12 oz.; milk, 248 lbs., 10 oz. Test made from October 8 to 14, 1903; age 4 years; estimated weight, 800 lbs.; fed 5 lbs. bran, 5 lbs. oats, 4 lbs. oil meal, 20 lbs. green corn, and 35 lbs mangel-wurzels, daily; hay *ad libitum*, poor pasture. Property of Estate of W. S. Ladd, Portland, Oregon.

Gertie's Sister 151594—Fourteen days: Butter, 29 lbs., 4 oz.; milk, 486 lbs., 6 oz. Test made from Oct. 8 to 21, 1903, age, 4 years; estimated weight, 800 lbs.; fed 5 lbs. bran, 5 lbs. oats, 4 lbs. oil meal and 35 lbs. mangel-wurzels, daily; 20 lbs. green corn daily during first week, and 40 lbs. daily during second; hay *ad libitum*, poor pastures. Property of Estate of W. S. Ladd, Portland, Oregon.

Landseer's Betsy 139724—Sire, Maple Glen's Stoke Pogis 34712; dam, Landseer's Blanche 98802. Butter, 15 lbs., 15 oz.; milk, 224 lbs. 4 oz. Test made from Nov, 4 to 10, 1903, age, 6 years, 8 months; estimated weight, 800 lbs.; fed 50 lbs. wheat bran, 45 lbs. corn and cob meal, 20 lbs. old process oil meal and 20 lbs. potatoes; hay *ad libitum*, poor pasture.

Nettie Newcastle 160833—Sire, Vida's Stoke Pogis 47856; dam, Queen Nettie 113948. Butter, 14 lbs., 8 oz.; milk, 260 lbs, 8 oz. Test made from Oct. 30 to Nov, 5, 1903; age, 3 years, 3 months; estimated weight, 850 lbs.; fed 10 lbs., ground oats, corn meal and bran in equal parts by weight, and 5 lbs. broken ear corn, daily, timothy and blue grass pasture.

Pauline Paul's Record.

ED. HOARD'S DAIRYMAN:—On page 990 of the DAIRYMAN, J. F. H. seems in doubt about your account of the record of the Guernsey cow, "Charmante of the Gron." I was also somewhat mystified by this record, as I had been taught to believe that the Holstein cow Pauline Paul, owned by D. F. Wilbur of Onconta, N. Y., held the world's record for butter production for one year, with a yield of 1,154 lbs. 15 ozs. of butter.

I had always supposed this to be an official test.

What constitutes an official test? I wish to be informed, as I have made the statement several times that Pauline Paul's test was an official test.

Canajoharie, N. Y. L. L. ST. J.

Pauline Paul's record as given above was made thirteen years ago, some time before what are now recognized as officially authenticated records were thought of, or possible. There was no Babcock test then, or other convenient and expeditious way, to ascertain how much fat the cow put in her milk, or otherwise put a check on the herdsman and buttermaker. Our understanding is, that Pauline Paul's record was strictly a private one, authenticated by affidavits of the persons in charge of the cow, but without supervision from outside sources. Nobody questions the integrity of her then owners, or that she was a great and prepotent dairy cow, but the evidence as to the yield of butter is not as convincing as that furnished by present day methods of verifying records.

THE ONLY LOW DOWN

Short Turn, Straight Bottom, Short Coupled, Light Draft Wagon on the market.

20 INCHES from ground to bottom of body. Will turn as short as any cut under reach wagon. Strong construction, nicely finished.

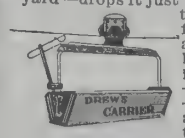
CHERRY'S
Perfected Barn Equipments

Consisting of Manure Carrier, Feed Carrier, Ensilage Carrier, Grain Elevator, Swivel Hay-Carrier, Hay Forks and Barn Door Fixtures. This system of carriers is built for **Heavy Work** and **Durability.** By the use of our **Curves** and **Switches** we can equip any barn. Send for illustrated Catalogue H and price list to



CHERRY MFG. CO.,
KNOXVILLE, IOWA.

WRITE TO US.

Every farmer should write for our illustrated catalog, explaining all about the

DREW ELEVATED CARRIER

—how it does the work of a hired man—carries the manure from stable to barnyard—drops it just where desired—returns automatically for another load—and you stay in the barn and **"Watch it work for you"**—it is self-operating—works perfectly and passes over anything on its trips in and out of the barn. The Drew Elevated Carrier saves more each year than it costs and every farmer should have one. It also carries ensilage, grain, fodder, etc., from one point to another. It does away with the barnyard wheelbarrow.

WRITE TO-DAY for CATALOG

LET US POINT OUT A GOOD FENCE

If you are going to buy any fencing this season, it is important that you buy the best fence on the market, and that you buy it at the Right Price. WE POINT OUT OUR

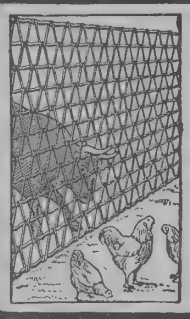
Advance Fencing

as being the best made fence on the American market. It has a continuous stay wire which is woven into the top and bottom strands from one stay to the next without leaving any loose ends. The stay wire cannot slip or slide on the horizontal strands. We have a Free Fence Book, which tells all about our twenty-three different styles of ADVANCE FENCING, a fence for every need on the farm. This book also tells how we sell our ADVANCE FENCING direct to the farmer, giving him the advantage of the dealer's and jobber's profits. It also tells how we sell Advance Fencing on 30 Days' Free Trial which gives you ample opportunity to be absolutely satisfied that you are getting just what you want. We Pay the Freight. This enables you to know just what the fencing is going to cost laid down at your railroad station. It is the fairest fence offer ever made by anyone anywhere. Send for our FREE FENCE BOOK and find out all about ADVANCE FENCING and our liberal offer before purchasing. Write for it at once. DO IT NOW. ADVANCE FENCE COMPANY, 33 H Street, Peoria, Illinois.

LT

Potash

is removed in large quantities from the soil by the growing of crops and selling them from the farm.



Unless the Potash be restored to the soil, good crops can not continue.

We have printed a little book containing valuable facts gathered from the records of accurate experiments in reclaiming soils, and we will be glad to send a copy free of charge to any farmer who will write for it.

GERMAN KALI WORKS,
New York—98 Nassau Street, or
St. Louis, Mo.—4th and Olive Sts.

The Strongest Fence Made

To sell direct to the farmer the strongest fence in the world, we must not only use the best ***HIGH CARBON SPRING STEEL WIRE,*** heavily galvanized, but we must build so that the greatest textile strength of material is maintained. Sixteen years, spent in perfecting ***Coiled Spring Fence,*** each year showing an added degree of perfection, has brought us to a point where we can proclaim with a confidence born of attainment that

OUR FENCE IS THE CHEAPEST AND BEST

Cheapest because the highest skill of the craft has been utilized to reduce the cost of manufacture, and this achievement, coupled with the largest output of the largest and best equipped plant in the United States devoted to fence manufacture, enables us to name you the ***VERY LOWEST PRICE AND WE PAY THE FREIGHT.*** Buy direct. We sell to you as cheap as dealers can buy. Put the dealer's profit in your own pocket. Examination permitted at your station; your money back if not as represented. Completion of sale rests wholly upon your judgment. Write us; we have something more to say to you. After correspondence is opened, you have your judgment to defend your interests at every advance of the deal. Our Catalogue is free, and is full of fence lore.

BRADLEY, ALDERSON & CO., Kansas City, Missouri.

The 1903 Shredder Blades

(Patent Applied for)

make efficient shredders out of "Ohio" Feed and Ensilage Cutters. The **New Shredder Blade** is the regular "Ohio" knife with solid integrally projecting bits which cut and tear corn stalks into a nicely shredded condition, as shown in the picture. It makes corn-hay of the fodder.

Shredder Blades are interchangeable with knives on all sizes "Ohio" Cutters. They successfully reduce fodder to the proper condition and do not pulverize the leaves like other styles. **They shred** with the same power, speed and capacity as "Ohio" Cutters, and either the Chain or Blower Elevators handle the shredded corn perfectly. **Speed,** 600 to 700 revolutions. **Power,** 2 Horse Tread up to 12 h. p. Engine according to size. Let us send the 1903 catalogue of "Ohio" Cutters and Shredders. "Modern Silage Methods" 10c, coin or stamps. Manufactured by

1904

ALL ABOARD!

Here it is, right at your door. Climb on, join the crowd; everybody welcome. Now we're off, let's take a backward glance at 1903. Has it been a good year for you, and are you happy? We hope so and we want 1904 to be better still. We are well satisfied with 1903 and full of hopes for 1904. We've accomplished a great deal and learned a lot in 1903 which we will put into practice in 1904. We made and sold enough TUBULAR separators to entirely outdistance all competitors, and we learned how to make the TUBULARS even better than they were last year. We shall never cease to make improvements and to add such conveniences to the TUBULAR as make it more attractive and satisfactory to the dairyman and more salable for our agents. The TUBULAR was introduced into more than thirty thousand homes in 1903 and will go into many more in 1904.

To every user of a cream separator, whether a TUBULAR or a "bucket bowl" machine; to all our agents, our friends and our competitors, we extend our best wishes for a happy and prosperous New Year.

For full information about the TUBULAR, write for catalogue No. 144.

MIDDLE MEN'S PROFITS TO THE CONSUMER THROUGH THE FEED

This is no experiment with us; we sell thousands of tons of Flour and Feed this way and have some of the largest buyers as customers.

Direct dealing shortens the selling expense and we give you the full benefit by furnishing you with better feed at a closer figure than you would otherwise be able to buy. We sell you at the same prices quoted our largest jobbers.

Our mill equipment is the most modern. All the wheat used in our mill is bought by an expert grain buyer, operating for us on the Minneapolis Board of Trade. ELMCO Feeds are rich in protein and possess feeding quality superior to ordinary feeds. Each department in our mill is in charge of an expert and the entire business is in charge of and under the supervision of men proficient in the milling business from wide and successful experience. ELMCO Feeds have a reputation for excellence enjoyed by no others. Samples sent and prices quoted to responsible farmers, dairymen and dairy associations.

Ask your Banker as to our reliability.

Indiana School of Agriculture.

The Winter School of Agriculture at Purdue University, LaFayette, Ind., affords a rare opportunity for you to get facts, principles, and training that will prove of great practical value to you in your every day work.

You can do this during the next two or three months and return to the farm in time for the busy season, as the term will begin January 5th and end March 11th, 1904.

Four courses of study and practice are offered, namely, Agriculture, Horticulture, Live Stock Husbandry, and Dairying.

The first is designed especially for those who expect to engage in general farming. It includes studies of the characteristics, impoverishment, fertilization and improvement of soils; the adaptations, uses, and improvement of farm crops; the principles of cropping and crop rotation; the nature, application and effect of manures and fertilizers; the chemistry of soils, fertilizers, and feeding stuffs; the location, grouping, and planning of farm buildings; live stock management, and the relation of Animal Husbandry to Agriculture.

The course in Horticulture treats of fruit and vegetable growing, commercial orcharding and market gardening, probblems in marketing fruit, laying out and embellishing of home and school grounds; beneficial and injurious insects of the farm, orchard and garden; vegetable parasites, including rusts, smuts, blights, mildews, etc., and spraying devices and mixtures for combatting insect pests and plant diseases.

The course in Animal Husbandry includes systematic studies of the classes, types and breeds of beef and dairy cattle, swine, sheep and horses; principles of feeding, breeding and improvement of live stock; value of a good pedigree, and the making and tracing of pedigrees; animal diseases and their causes and prevention, sanitary care of flock and herd, etc.

The course in Dairying is designed for two classes: 1. Milk producers and private dairymen. 2. Those who wish to become creamery managers, creamery butter makers, etc. The lines of instruction will include studies of milk and its products, milk testing and cream ripening, churning, working, salting and packing butter; the care and use of the utensils and machinery employed in the private dairy and in the commercial creamery. The equipment, operation and repair of dairy and creamery machinery will also receive due consideration.

Regular laboratory exercises in the study of soils and draft problems; in budding, grafting and making cuttings; in scoring corn and in judging live stock; in separting milk and testing milk and cream for the per cent of butter fat, and in the making and scoring of butter, fix the instruction given and make it of direct practical value in the every day work of the farm.

Most winter course students return to the home farm. Many of these write that the instruction received has added greatly to their sucess. Many return for a second term, which they find even more valuable than the first. Several bright, earnest young men have been able to enter lucrative positions after taking one or two winter courses at Purdee.

An illustrated circular of the winter school of Agriculture, giving full information, will be sent you on request.

DON'T PUT OFF

Seeing your friends and having them join in for a good club of subscribers.

Of Interest to Wisconsin Farmers.

The College of Agriculture, University of Wisconsin, offers to the farmers of Wisconsin, what will hereafter be known as the Farmers' Course in Agriculture. This course will immediately follow the annual meeting of the State Board of Agriculture, the first session being held at eight o'clock a. m., Friday, February 5th. There will be lectures on many subjects by the professors in the College of Agriculture. Special attention will be given in corn judging and stock judging. In addition to the regular instructors, half a dozen experts in animal husbandry, drainage, etc., will be present to render assistance.

No person under twenty-five years of age will be registered in this course.

Residents of the state will pay no fees. For a printed circular and other information concerning the new farmers' course, address W. A. Henry, Dean, Madison, Wis,

Corn and Cow Peas in Missouri.

Ed. Hoard's Dairyman:—I here send you two pictures of my corn and cow peas and cane and cow peas as you asked me to do some time ago. They were taken just about the right time, just before frost came on.

The picture of the corn and cane is as good as could be. I think the man standing in the cane has an eight foot stick in his hand so you see how much taller the cane is than the stick and the pea vines running over the cane like morning glories. The picture of the corn and cow peas is not quite right as it does not come just down to the ground, it only shows the man down to the knees, but otherwise it shows the corn and cow peas plain. The pea vines can be seen running all over the corn tassels. If you think it will be worth while I will tell you how I raise them together. Wm. H. B.

Concordia, Mo.

We shall be glad to hear from our correspondent on the above subject.

Dairy Questions Answered by Prof. Farrington.

Dividends of Milk and Cream Patrons at the Same Factory.

In regard to the answer of Prof. Farrington as to the advantage that should be given a cream patron over a milk patron of a creamery, I beg to challenge the correctness of the Professor's statement, Granting a loss of .03 in the skim milk and the average test of milk 4, that means a loss of .03 butter fat in every 100 lbs. milk or 4 lbs. butter fat. Then if you have a loss of .03 on 4 lbs. butter fat on 1 lb. butter fat, you would have ¼ of .03=.0075 loss. 64 lbs. butter fat multiplied by .0075 gives 64.48 lbs. against the Professor's 65.92. On 1,000 lbs. butter fat his figures would claim 30 lbs. to be given cream patron, while I claim 7½ lbs. as correct. If the loss was .02, on 1,000 lbs. it would be 5 lbs. * * *

Lockford, Cal.

The statements made in the above letter show that the writer does not fully comprehend the calculations which I made in a former article.

In stating the difference between the payment of milk and of cream patrons at the same factory, I have always tried to make it plain that the three per cent which is added to the butter fat in order to make up for the loss in the skim milk of the milk patron, does not represent a test of .03 (three-hundredths of one per cent fat) in the skim milk, but rather a test of about .12 per cent fat in the skim milk. This test of .12 is three per cent of the fat in milk testing 4 per cent fat. I have assumed that the average test of whole milk as it is received at factories is 4 per cent fat and that the average farm skimming leaves .12 of one per cent fat in the skim milk. Based on this assumption, the loss of .12 is 3 per cent of the fat in milk testing 4 per cent fat.

This three per cent is then added to the total weight of cream delivered to the factory by the cream patrons, and the figures obtained show approximately the amount of fat in the milk from which the cream was skimmed. In this way both the milk patrons and the cream patrons will be paid for the fat in their milk.

This test of .12 in the farm separator skim milk, I am positive, is none too great. Tests of farm separator skim milk may be made which show .03 or less per cent fat in the test bottle, but these tests are undoubtedly incorrect. We have used about twenty different sizes and makes of hand separators at our dairy school every winter for the past five years. They are operated by students who come from farms and I think that it is safe to assume that the work they do will compare well with the hand separator skimming at farms in general. It often happens that they test samples of skim milk and get results which show as low as .03 of one per cent fat, but we try to teach them that the testing was not properly done and show them how they can get more fat out of the skim milk by adding an excess of acid and whirling the bottles at a high speed and in a hot tester.

The statement of this correspondent is, therefore, incorrect, first because the test of .03 per cent fat in skim milk is too low and, second, because his calculation does not take into consideration the paying of the cream patron in any way for the labor of skimming his milk at the farm. When cream is collected and delivered to a factory, there is no need of running a power separator at the factory. This expense is therefore saved when the skimming is done at the farm and the cream patron should receive the benefit of it. As near as I can make out from your correspondent's statement, he has not taken into consideration in his calculations the work which is done by the farmer in skimming his milk at home and the saving which this skimming makes for the factory.

I think a careful study of the calculations as I have given them, if they are considered without confusing the test of .03 per cent fat in the skim milk with the addition of three per cent to the total weight of fat, will show that the milk patron and the cream patron are fairly treated when they are paid on the basis of a three per cent loss in skimming at the farm, that is three per cent of the total fat in the milk, or a skim milk test of 0.12% fat.

Yield of Cheese from Milk.

I have seen letters in Hoard's Dairyman that you have written in regard to paying the patrons of cheese factories by the test. Now it may seem a cheeky thing to say, but I can not agree with you that the test is the correct basis to pay by. I do not doubt but the reports of factories show the yield of cheese to be 2.6 to each pound of fat, but they do not say how much fat went into the whey tank; that is what you ought to find out. Bulletin No. 28 U. S. Agricultural Department gives the chemical composition of whole milk cheese as follows:

CORN AND COW PEAS.

A Stand of Cane and Cow Peas on the Farm of W. H. Bruns, Concordia, Mo.

Water	34.3
Protein	26.1
Fat	33.5
Carbohydrates	2.3
Ash	3.8

This is the average of perhaps five hundred different samples of cheese. Now you make the fat in cheese like this: 1÷2.6 equal 38.46 per cent fat in one pound cheese; the authority quoted says 33.5 per cent is the amount of fat in cheese, a difference of 4.96 per cent. That is not much, but where has it gone? I think into the whey tank, and to be sure about it I want you to experiment and find out if there is not a great waste of fat in making high test milk into cheese.

Another thing you say, or fail to say, is to fix a limit to the amount of fat that can be held in cheese. You reason that whatever the test is, it means 2.6 pounds of cheese for each pound of fat, that is, take 100 pounds of cream that tests 20 per cent fat and make it into cheese and the result would be 20×2.6 or 52 pounds of cheese. That is nonsense, but where is the limit? Now it seems to me that the Station at Madison is for the purpose of experimenting and to give the people some reliable and exact facts about making cheese and not to take reports from factories and pass it around as gospel.

In conclusion I think cheese makers should test their milk, then pay their patrons by weight and allow the high test chaps the privilege of skimming the whey tank." * * * *

Spokeville, Wis.

There is a slight error in your calculations as given and your assumptions in one or two cases are also incorrect.

First, the per cent of fat in one pound of cheese, which, according to your calculation is 38.46, is not accurately figured, as the method you have used for getting these figures shows the amount of fat in the milk which will make 100 pounds of cheese, instead of the fat in 100 pounds of cheese itself. I think by looking over your figures a little more carefully you will notice your error in this particular.

It will take about a thousand pounds of milk to make 100 pounds of cheese, in which, according to the figures you quote from bulletin No. 28 of the U. S. Agricultural Department, the 33.5 pounds of fat will be held. This 33.5 pounds of cheese fat does not represent the entire quantity of fat in a thousand pounds of milk, because about .4 of one per cent fat is lost in the whey. This on 1,000 pounds would amount to 4 pounds, which added to the 33.5 makes 37.5 pounds fat in the 1,000 pounds of milk from which the cheese whose composition is quoted in the U. S. bulletin would be made. This 37.5 per cent is not very much different than the 38.4 which is the fat in the milk from which the cheese is made according to your calculation and then compared with the 33.5 per cent fat in cheese. I think you will agree with me that this difference of one pound in a hundred is not very much when the nature of cheese and its composition are considered; that is to say, cheese made from two lots of 1,000 pounds of milk each will naturally vary at least this much in composition. It is not possible to make cheese having absolutely the same composition each time and you will see by these figures that there is not a difference of 4.9 pounds, which your figures would seem to indicate, but the difference is a little less than one pound.

It has been shown by many careful experiments that the test of whey in cheese making does not vary greatly when cheese is made from milk containing different per cents of fat. This has been shown to be true by repeated experiments and observations made at cheese factories in both Wisconsin and New York. The average test of whey is about .4 per cent fat and this does not vary very much with the richness of the milk. Milk testing 3.0 per cent fat will give whey testing about .4 per cent and the whey from milk testing 6.0 fat will hold about the same amount of fat. You will see, therefore, that the richness of the cheese increases with the richness of the milk and the limit of the amount of fat that cheese will hold is not dependent on the loss of fat in the whey under normal conditions.

The example which you give of 100 pounds of cream testing 20.0 per cent fat is not a fair one because cheese is not commonly made from cream and the figures which I have used in discussing this question are intended only to apply to normal milk and not to absurd conditions and illustrations such as the making of cheese from cream testing 20 per cent.

The figures I gave, which was that one pound of fat in milk will make 2.6 pounds of cheese, is only an approximation, as I have always stated in everything that I have written on this subject. It will, however, give a fair idea of the cheese producing value of milk, because repeated experiments have shown that the richness of normal milk does not influence to any great extent the test of the whey, but the fat in the thin milk and rich milk, excepting about .4 of one per cent, all goes into the cheese and on this account the whey from low testing and from high testing, normal milk does not vary very much in the amount of fat it contains.

Average Test of Wisconsin Factory Milk.

Can you give me any idea about what the average Babcock test is of the milk received at the creameries of your state? * * * *

Niagara, Penn.

A few years ago the dairy school sent representatives to some 50 creameries and 104 cheese factories in the state of Wisconsin. These visits were made during the summer and at each factory considerable information and statistics were obtained. The results of these observations showed that the average test of the milk received at 52 creameries during the summer months was 3.75 per cent fat. This milk represented that sent to the creameries from the 2,189 patrons who contributed about 250,000 pounds of

milk, making over 10,000 pounds of butter per day, to these factories. The average daily amount of milk delivered per patron was about 130 pounds.

During the same season, 104 cheese factories were visited during the months of July, August and September. The total milk received at all these factories was about 430,000 pounds per day, or a little over 4,000 pounds per factory. This milk was contributed by 2,800 patrons at the rate of about 154 pounds of milk per patron. The Babcock test was not used in all these factories but at 56, or about one-half the number of factories which were paying for their milk by the test. The average test of the milk was 3.61 per cent fat. In 54 of these factories the difference between the highest and the lowest test of the milk delivered by the different patrons was in one case 2.4 per cent, and in other cases about one per cent. In one factory the lowest test of the milk of any patron was 2.6 per cent, the average 3.2, and the highest 5.0 per cent. I think investigation will show that the use of the Babcock test in cheese factories will have a tendency to cause the milk to be more uniform in quality from day to day than is the case where no tester is owned at a factory. The results of these observations indicate that the average test of the milk sent to Wisconsin factories during the summer months is very nearly 3.7 per cent fat.

THE WEIGHT OF A PIPETTE FULL OF MILK.

"With my scales for weighing samples of cream it takes about 17.8 c. c. of milk to weigh 18 grams. How is that? Should it not balance with 17.6 c. c. milk? I have just bought a new scale for testing the cream, although formerly I have been using the pipette. If it is going to take so much more cream, than milk, this will make my overchurn very small. I have been getting from 15 to 18 per cent by using the pipette.

If samples are carefully taken and tested correctly, what should be the overchurn on hand separator cream testing 25 per cent fat?"

Rock Falls, Wis. * * *

The Babcock milk test pipette has a capacity of 17.6 c. c.; this is supposed to deliver 17.5 c. c. milk. The one-tenth difference between these two figures includes the milk which clings to the inner walls of the pipette and is not drained out during the time that pipettes are ordinarily allowed to drain when milk is measured with them into the test bottles.

This 17.5 c. c. of milk is supposed to weigh 18 grams. This weight is obtained by multiplying the 17.5 c. c. by 1.032, which, it is assumed, is the average specific gravity of milk.

There is a difference between the weight and the volume of many liquids, and as milk is heavier than water, the specific gravity shows just how much heavier a given quantity of milk is than the same quantity of water at a given temperature. Your Babcock milk test pipette should, therefore, deliver 17.5 c. c. of milk, and this ought to weigh 18 grams. If the pipette is correctly graduated and your scales are correct, you will find this result every time. If you do not get such figures by repeated trials you ought to have either the scales or the pipette tested by a competent person. In many cases the local druggist is able to do this, and if you will take your pipette to him and explain what you want, he will probably have sufficiently delicate scales so that you can test the accuracy of both your scales and your pipette.

The figures already mentioned apply to milk. When you are testing cream the fat in the cream lightens it so much that a pipette full will not weigh 18 grams. I think very likely that it would take 17.8 c. c. of cream to weigh 18 grams, but this will depend entirely on the richness of the cream. The more fat the cream contains the lighter will be a given quantity of it, such as your pipette full.

A cream containing 25 per cent fat weighs about the same as water and a pipette full of such cream will weigh about 17.5 grams; as cream grows richer than this it is lighter than water, but as the fat diminishes it becomes heavier until it reaches its maximum weight as milk. If, according to your scale and pipette, it requires 17.8 c. c. of milk of average quality to weigh 18 grams, either your scales or your pipette need investigation, but I should repeat the weighings with different samples of milk, first warming them to a temperature of about 60° before finally deciding that a mistake has been made in the results.

The overchurn from hand separator cream will range from 18 to 20 per cent. It is a little higher than the overchurn from milk, because when the overchurn is calculated directly from the cream you do not have to take into consideration the fat left in the skim milk, as is the case when you calculate the overchurn from fat in whole milk.

E. H. FARRINGTON.

Wis. Dairy School.

Wisconsin Buttermakers' Premium Fund.

ED. HOARD'S DAIRYMAN:—The premium fund for the Wisconsin Buttermakers' Convention stands as follows:

Previously reported	$818.44
J. B. Ford Company, Wyandotte, Mich.	15.00
Elgin Butter Tub Co., Elgin, Ill	10.00
Empire Cream Separator Co., Chicago, Ill.	10.00
International Cream Separator Co., Chicago, Ill	10.00
Farnsworth, Benjamin & Mills, Boston, Mass	10.00
Chapin & Adams, Boston, Mass	5.00
Coyne Brothers, Chicago, Ill	5.00
Miscellaneous contributions	1.56
Total	$885.00

The above magnificent fund will be divided pro rata among exhibitors who score above 87 points.

Mr. W. D. Collyer will score the butter again in the presence of the buttermakers which excellent opportunity for first hand, expert criticism ought to be worth the personal attendance of all buttermakers who can possibly avail themselves of this exceptional privilege.

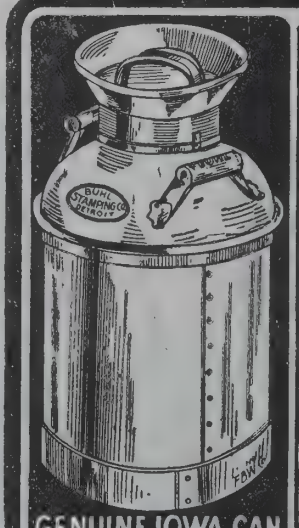
Mr. Jules G. Lombard has kindly consented to be present at our convention and again thrill us with his old-time melodies.

Ex-Gov. W. D. Hoard and several other speakers of note will be present during the different sessions.

Ettrick, Wis. F. B. FULMER, Sec.

Johnson Grass.

This grass is a native of the Mediterranean region. It was introduced into the southern states about 1830, and for some time was known by the name of Mean's grass, which name it still retains in some localities. About ten years later it was introduced into Alabama from South Carolina by William Johnson, and has since been quite generally known as Johnson grass. Its botanical name is *Andropogon halapensis*, or *Sorghum halapense*. It is sometimes called Guinea grass, but this name properly belongs to *Panicum maximum*, a tropical forage grass sometimes cultivated in southern Florida.



Johnson grass has received considerable attention in Kansas lately. It has been grown in the plats of the Kansas Experiment Station for several seasons, and its behavior in our climate tested. It is a rank-growing perennial, with numerous strong, rather fleshy creeping root-stocks, by which it propagates. The stems and leaves are coarse but quite succulent. It seeds abundantly, and seed can be purchased at all seed houses. If the seed is clean, about one bushel per acre is sufficient for sowing. Johnson grass is chiefly used for hay, for which purpose it should be cut early, before the stems become too old and hard. Usually two or three cuttings can be made. The seed should not be sown until the ground is warm, or it will not germinate well. Johnson grass prefers rich, moist soil, though it will grow in quite a variety of soils. It is injured by severe winters, but the cold winter of 1898-'99 did not entirely kill out the experimental plat, and it quickly recovered from the effects of the cold. It is not a success as a pasture grass, as it is injured by grazing to such an extent that a pasture soon becomes useless, yet the vitality of the root-stocks is such that it is never entirely killed out in this way, and, after a rest, soon recovers from the effects.

Throughout the south, under proper conditions, it is considered an excellent hay grass, and in all parts of Kansas where there is sufficient moisture it will undoubtedly be valuable for the same purpose.

However, it is exceedingly difficult to eradicate the grass on land where it has obtained a foothold, and for this reason it may become a pestiferous weed. Hogs are rather fond of the root-stocks and when confined upon a plat of the grass will destroy it. But on soil adapted to its growth it requires great care to eradicate it. If one wishes to grow Johnson grass, the best plan is to devote a field to the purpose without expecting to subsequently put the field in cultivation. With care it can be confined to this field. After a few years the ground becomes so full of root-stocks that the development is hindered. To rejuvenate a field, it should be plowed and harrowed in the spring, or else thoroughly disked.

All these points should be carefully considered before the grass is given a

Truth to Tell

There are no other milk cans made that can equal in wearing qualities the genuine

BUHL CANS

They are tinned to stay tinned, and put together to stand years of hard service. Other cans crack easily, become dented, and being lightly tinned soon rust and go to pieces. Not so with the "Buhl Factory," "Improved Elgin" and "Genuine Iowa." They will outlast any other cans on the market, and are thoroughly and quickly cleaned. Remember, the Buhl is the only can in the world that is made with the Buhl "Victor" Can Breast and the Buhl "Victor" Round Handle. As there are many inferior imitations of this can, we stamp all ours with the Milk Can Trade Mark. Look for it. Sold by all live dealers. Ask about them, or write us direct.

trial. As a forage grass it may prove of great value, and the fact that it is difficult to eradicate may be in its favor in those parts of Kansas where it is not easy to grow forage plants successfully. But if tried, great care should be taken to keep it under control. A. S. HITCHCOCK.

Kansas Exp. Sta.

The Sceptic Tank for Disposing of Sewage at Creameries.

ED. HOARD'S DAIRYMAN:—In some one's report of the North Western Dairy Association not long ago, we noticed a speaker brought to the notice of the meeting the matter of creamery sewage, and suggested the tank method. This method is somewhat new, not only to creameries but to private houses in town and country where there is no public system of sewage. We believe the sceptic tank system the only thorough system of sewage disposal for private houses and creameries, and will endeavor to describe and illustrate the system. It may not be out of place to say that the average creamery is one of the greatest dangers and menaces to the public health of the surrounding country in which it is located, and the wonder is that there are not more evidences of typhoid emanating from the polluted surroundings.

We cannot think of anything more putrid than the rotten slime which comes from the separator, and when this spreads itself through the ground and water, the volume of contamination is fearful. Some day folks will awaken to an experience of creamery contamination, and then sanitary measures will be the order of the day. It is however, not the time to lock the stable after the horse is stolen. The time to act is now. The sceptic tank system of sewage is not at all expensive, and is certain in its cleansing and purifying results. Many private houses are adopting them as the only perfect system of private sewage.

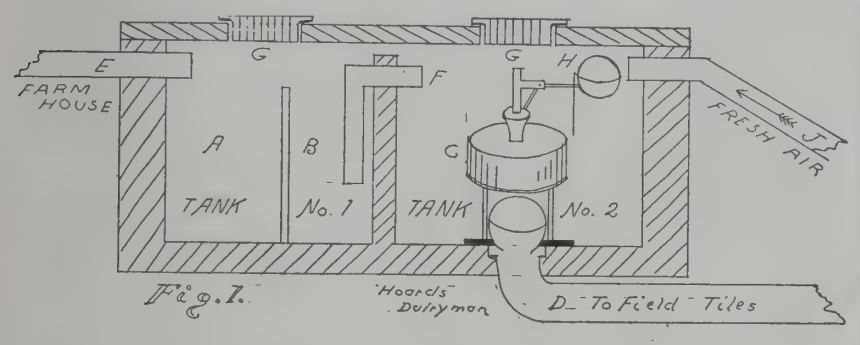
We briefly outline the construction and operation of the sceptic tank system and hope it will be of value to those creamery men who are willing and anxious to have their premises in the best possible sanitary condition. Referring to the accompanying cuts it will be seen that the tank, Fig. 1, constructed preferably of brick or stone well bedded in cement to prevent leakage, is built at such a level as to allow the discharge pipe, D, which is of glazed tile to leave it at a depth of not more than twelve inches beneath the surface of the earth. Where the surrounding land is level, this tank may be located quite close to the building, where, if covered with, earth, and nicely sodded over if desired, it will not cause any inconvenience.

If more convenient, it may be placed any distance from the building and the inlet pipe E, laid along a mound or ridge of earth, and covered with earth to protect it from frost; this must have a slight fall from the building too, and must enter the tank at the top as shown. If, however, there is a considerable slope to the land, the tank may be buried beneath the surface, it being borne in mind this pipe D, with its branches, must not be more than twelve inches beneath the surface and must be perfectly level.

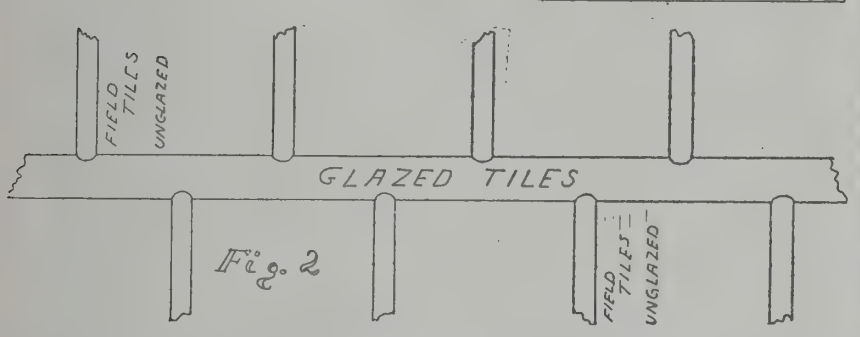
From pipe D. about every two feet are run branches of field tiles, see Fig 2, the total contents of which should be equal to the amount of water which will be discharged at each operation of the valve. The band connecting the system of sub-surface tiles should be of iron, solidly cemented into the bottom of the tank to allow of the caulking in of the valve with lead.

This valve is a somewhat recent invention and the only one of its kind which can be set at any level, will open and close atuomatically, and as it needs no adjusting, it can be put in by almost any person. It overcomes the only objection ever made to the sceptic tank system, that where the emptying of the tank depended on some person to pull a plug at regular intervals, replacing it when all the liquids had escaped, it was sometimes forgotten and the tank overflowing caused the pipe between it and the house to fill up, thereby causing a great deal of annoyance and expense.

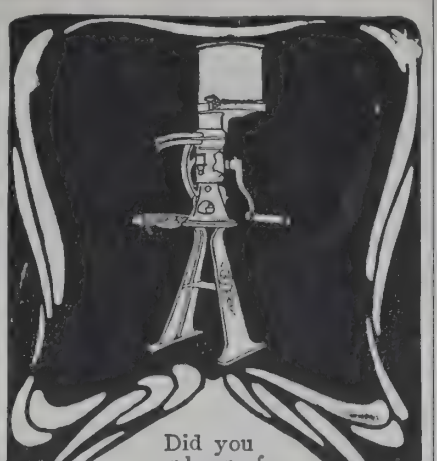
It will be noticed that a dividing wall is built in the centre of the tank to the height of about two inches from the top, the latter space being left to the free passage of fresh air, and a subdividing partition of planks with small spaces left between to allow the liquid to pass through, is built in compartment No. 1. The object of the latter partition is to keep the bulk of the solids from overflow F. Pipe J, the mouth of which is turned down, permits the entry of fresh air, which passes over the sewerage and up through the soil pipe E to the roof. Manholes G G provide access to both tanks.



The operation of the tank works this way: All the sewage from the building enters the tank through pipe E, filling compartment No. 1, the solids being compelled to float by the gases generated underneath. When this compartment is filled the liquid overflows through F into compartment No. 2, the valve C, of which is closed.



When however the liquid rises to the level at which float H is set, the valve opens, discharging the whole contents of compartment No. 2, be it fifty or five thousand gallons, into the system of subsurface tiles through which it soaks into the earth, there to be taken care of by natural agents. As the valve closes automatically when the tank is nearly empty, it will be seen that sufficient time will be given for that which has just been discharged to soak away before the tank fills again and the operation is repeated.



About the solid portion of the sewage retained in compartment No. 1, the value of the system will be appreciated when it is stated that so thorough is the action of the millions of bacteria on this body, causing the almost immediate disintegration and decomposition of everything entering the tank, that tanks when opened after a year's use, and into which the sewage from buildings containing many inmates was emptied, were found to contain not more than two or three pails full of a kind of earthy substance, from which scarcely any odor was perceptible. It must be borne in mind that no disinfectants are necessary with this system, and nothing in the shape of chemicals should ever be allowed to enter the tank if the life of the bacteria, which is so essential to its success, is to be preserved.

As to size, it may be said that for any ordinary creamery a tank six to eight feet long by four to six feet wide, and from three to three and one-half feet high, would be sufficient. J. A. M.

P. E. I.

Did you ever hear of a dairyman who uses an **easy running**

Empire Cream Separator

and is dissatisfied with it? Did you ever hear of a man who is operating his dairy in the "Empire Way," who is not making more money than he ever did before?

You never did—because the Empire Separator and the Empire way of dairying bring money and success.

Ask Any Empire User.

If you want to know more of the Empire Separator and the "Empire Way," write for our books. They are free.

Empire Cream Separator Co.,

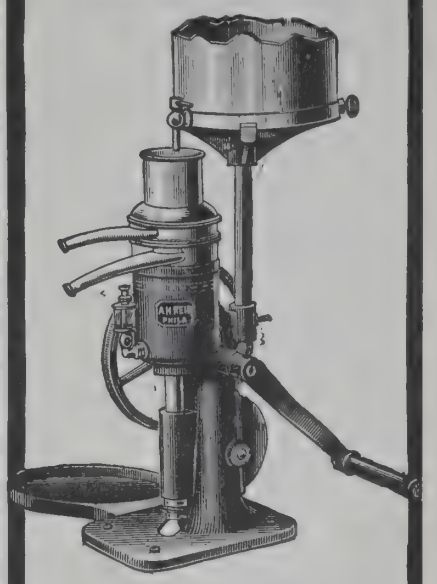
Bloomfield, N. J. Chicago, Ill.

The weekly sales of the Empire have increased 1,000 per cent in three years. Does that mean anything?

All The Cream

got with least labor in least time and with least bother washing up, is what the cow owner wants. The machine that meets the requirements is the

OMEGA Cream Separator



It's the simplest, therefore less likely to get out of fix. It turns with half the power of the others. It has only two parts to be cleaned. Sent on trial. Ask us to mail you our booklet, "Milk Returns." It interests those interested in separators.

THE OMEGA SEPARATOR CO.,
22 Concord Street, Lansing, Mich.

Painkiller PERRY DAVIS' CURES COUGHS, SORE THROAT

Reid's Hand SEPARATOR

The "best" separator is that one which does its work most thoroughly and easily, that is built of strongest material, and that is most easily washed and kept in order.

First cost is a great point with a buyer, but ease of running, perfection of skimming and simplicity in washing are even greater considerations.

The **Reid Hand Separator** has but a single cylinder inside the bowl, and skims as closely as one-hundredth of one per cent. Indeed, some tests indicate "not a trace" of fat in the skim milk.

The Reid is perfectly planned and strongly built, and it literally "runs like a watch."

As to our guarantee of excellence, we make the strongest statement that can be expressed in words: **Money back (less freight) if the buyer is not satisfied.**

There is a new (free) booklet about the Reid Hand Separator.

Sizes run from 150 lbs. to 500 lbs. per hour.

Every owner of 10 or more cows can get more butter from his herd by using a No. 6

NATIONAL Cream Separator

It's a big saver in the dairy. Separates about one gallon a minute, or 450 lbs. in an hour. A light running machine—does quick and close work under all conditions.

The price of the No. 6 National is $100. You take no risk in ordering, as the machine has stood the tests of Experiment Stations, and the severer trial of constant use in private dairies. Hundreds of practical dairymen have proved that the National way makes the dairy pay.

Send for free pamphlet No. 30. It will save you money and increase your profits. Write *now*.

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of them read dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own light who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

AS IT IS IN INDIANA.

C. P. Goodrich took a cow census at Plymouth, Ind., a few weeks since of 50 farmers patrons of a creamery. Note the following facts: The total number of cows was 250: the average cost of keeping per cow was $24.96, the average returns in butter fat per cow was $32.20; the average number of pounds of butter fat per cow was only 166; the average net price was 19.4 cents: the average net profit per cow above cost of feed was $7.24; the average returns for $1 worth of fead was $1.29. The six patrons who read a dairy paper averaged $21 per cow over and above the cost of feed, while the 44 who did not read a dairy paper received only $5.58 per cow above the cost of feed. Does it pay to go without sound dairy reading?

NEW YORK DAIRYMEN WAKING UP.

A trip to Madison, St. Lawrence and other counties in New York last week brought forcible evidence to view that the dairy farmers of that state are arousing themselves concerning the adoption of more intelligent methods in dairying, as never before. More silos were built last season in many sections than had ever previously existed. Greater interest is being manifested in the growing of clover and alfalfa, not alone as a cow food, but also as a means of soil enrichment. We believe the New York and eastern farmers generally have placed too much reliance upon mineral manures.

It was easier and simpler to buy some phosphate or nitrogen or potash, than it was to change the system of tillage and grow more clover. This system left out of consideration the important factor of adding more humus or organic matter to the soil, putting it more nearly in the condition in which it existed when in a state of nature. When we stated before a convention that we used 20 pounds of clover seed to the acre, sowing it with all grain crops, largely as a system of manuring, plowing it under in the fall, we were met with the protest that such an outlay was too expensive. When we replied that the seed cost 12 cents a pound, or $2.40 an acre, and that in no other way could we manure as heavily for so little money, no reply was heard, but we could see that it produced thought. We can hardly understand how it is that in many sections of New York, where clover was largely used in rotation 40 years ago, and greatly depended upon to keep up fertility, that the farmers are sowing but little in later years.

Greater interest than ever is manifested in the construction of healthy and well ventilated stables. New York has a large cow population and they must be kept in the stable fully six months of the year. The old fashioned, dark, badly lighted and ventilated stone stable, still exists in all its glory.

The great and increasing demand for milk by the cities, has set up the accompanying demand for better stables. The farmers feel it, and realize its great importance. They must make sanitary milk, and it is hard to do this in unsanitary stables. And this situation is stirring their thought as never before.

There is also increasing interest felt concerning the great importance of keeping better cows. To this end the New York farmers are paying more attention than ever to the better breeding and development of the special dairy cow.

The beef or dual-purpose craze has not debauched the iudgment of dairy farmers in the Empire state, as it has in some of the western states. It is not considered good economy to "skin a flint for a sixpence, and spoil a knife worth two shillings" or what is the same thing, to sacrifice $25 or $30 worth of milk to get $15 worth of beef, particularly when beef is growing less in price every day.

The dairy idea has had possession of the New York farmers for over a half century and as a result there is greater interest than ever manifested in the breeding and development of the true dairy cow.

These manifest signs of improvement are hailed by HOARD'S DAIRYMAN with great satisfaction.

A VALUABLE ADDRESS.

We hope every reader of the DAIRYMAN read the splendid address of Mr. Winslow, Secretary of the Ayrshire Breeder's Association, which was given on page 1053 of last week's issue of HOARD'S DAIRYMAN.

Mr. Winslow in this address, shows conclusively that he is a profund student of the principles that govern in the breeding of dairy cattle. He works out these principles in an admirable manner, and in doing so adheres faithfully to the lines of the specific dairy temperament. He has been a close student of practical utility, which demands that the dairy cow shall be bred and fed for her highest development as a *dairy* cow. Rightly enough, he has scant patience with faddist notions of mere breed type, when they stand as a bar to the development of the dairy type. For that reason his protest against the show ring notions, that have forced the Ayrshire cow away from her true purpose and best development, is well timed, and should sink deep in the minds and convictions of the breeders of all families of dairy cattle. A few years ago many Holstein breeders were bound to follow in the destructive "general purpose" path with their cattle, which course had well nigh destroyed all the dairy qualities of the Short-horns. To this end, they were selecting the most beefy bulls they could find. HOARD'S DAIRYMAN made a strong protest against such a suicidal course.

The following extract from Mr. Winslow's address is worth repeating:

"The question for Ayrshire breeders to decide is whether they will hold to the Ayrshire model as laid down by Scotch breeders for the show ring, or will change somewhat the ideal type as laid down in the scale of points, and *allow a more decided dairy type* to be the standard of excellence. Are the breeders of Ayrshires to stand still and keep the standard of the Ayrshire cow at a medium grade, or are they ready to push her to the front as a producer?"

To this important question, HOARD'S DAIRYMAN desires to make a single assertion. If the Ayrshire breed or any other breed, is pushed to the front as a producer, the standard or type that shall guide the breeders must be the producing type. Breeders in so many instances are but shallow students of the physiological side of this question.

They cannot see that great universal law of Nature, that function, when left to itself, nearly always fashions form to suit that function or purpose. More than this, no man is wise enough to set bounds or fashion for Nature to follow. Therefore, it is supreme folly for any set of men to attempt to establish an outline of the dairy cow that is not governed at every point by Nature. Nature always works obediently to the domination of the law of purpose or function. All animal forms are fashioned to suit the great central purpose for which they are made to serve; every true breeder of animals *for a purpose* must recognize this law. If we breed cattle for the show ring purpose, artificial and unnatural in outline, then we must be content to accept show ring results, and that alone.

Why should not the Ayrshire breeders do as the Guernsey breeders have done, make a thorough revision of their scale of points so as to bring the same within the meaning and definition of the best practical American idea of what a true dairy cow should be?

VERY TRUE.

Writing on "Some Hints on Cow Comfort" in the *Jersey Bulletin*, E. R. Wood has the following to say concerning the man side of the business:

So true is it that a cow's performance varies radically under different conditions, that the careful man hesitates when a would-be purchaser asks what she can do. Because under Mr. A.'s care and feeding, any individual animal has done so-and-so, is no sign she will do the same for Mr. B., who manages his cows in an entirely different manner.

Supposing Mr. A. assures Mr. B. that the cow he is purchasing of him will make 300 pounds of butter in a year, or that she gives a certain amount of milk night and morning. In her new home she may stand all day in the snow or cold wind of winter, with food not of the best in quality or quantity, yet, if she fails to come up to the standard as set by her former owner, her present one does not hesitate to state that Mr. A. misrepresented the animal to him. It is always safer when selling a cow to say: "She has done so-and-so for me; what she will do for you depends upon how you feed and care for her."

ONE WHO OWNS FINE STOCK

of any kind should, it seems to me, take pride in giving them the best of care. Yet occasionally a man is found who does not do it. Concerning certain owners of choice Jerseys, with pedigrees among the best, and able under favorable circumstances to rank high as performers, I have heard it said: "So-and-so has fine cows, but he does not take care of them."

No one in his right mind would think of throwing dimes, quarters, and larger coins into the gutter to be absolutely lost, yet the man who neglects his stock, allowing it to suffer from cold or for want of adequate food to perform the functions for which it is kept, is doing that very thing.

One of the most frequent things we note among dairy farmers is their lack of faith in liberal feeding of their cows. Somehow they cannot be prevailed upon to believe it will pay to study this feed question, or to provide an abundance of the right kind of food. We believe that fully three-fourths of the patrons of creameries in the land honestly believe it does not pay to feed their cows liberally. As a consequence there are more underfed than overfed cows. Another thing they don't believe in is the balanced ration. A great many do not understand what is meant by a balanced ration.

This is evident all about us in Wisconsin and in other States. Here we have thousands of farmers feeding oats with 9 per cent protein, at 40 cents a bushel. That is a cent and a quarter a pound or $25.00 a ton. They can buy gluten feed containing 27 per cent protein, or four times as much, for the same price per ton, yet they cannot be prevailed upon to sell their oats and buy the gluten.

If they understood this principle of a balanced ration they could not be fooled into such an unwise and wasteful course of feeding as they are continually following. If these farmers were readers and students of their business, if they recognized the fact that a little intelligence pays a big profit, if they would get rid of their silly notions about "book farming" they would save a mint of money they are now throwing away. And then there is the kind of a cow that is best to put this feed into. The same lack of discernment exists there as exists in the feed question. Men are feeding poor cows, wasting the feed, when a little effort and gumption would show them the difficulty. But they will not make the effort. They comfort themselves with the saying; "I guess I am doing as well as my neighbor."

ADVERTISING VS. READING MATTER.

A subscriber in recently writing us complained that we carried too much advertising. It was not so much more reading matter that this man wanted, but less advertising, for the more advertising we carry, the more reading matter we give, as, when our advertising reaches certain limits we add extra pages. The advertising colums of HOARD'S DAIRYMAN should be invaluable to the reader. These columns contain no cheap, trashy advertising. They contain not merely the announcements of some one that has something to sell, but make it possible for you to obtain information regarding an improved method or device that you may or will want. Bear in mind that it is the progressive man of the day that advertises. If a man has anything that you want, it ought to be worth his while to tell you about it,—that's advertising.

The columns of HOARD'S DAIRYMAN enable you to know all that the men who make cream separators can tell you about separators. Every manufacturer who makes a separator, that he thinks a dairyman would buy, has his ad. in HOARD'S DAIRYMAN, for that is where he reaches the buyer; and these columns enable you to know about all the different kinds. We advertise the manufacturers of the best and improved dairy machinery of all kinds; the columns make it easy for you to find anything that you want, and often something you needed, and didn't know you wanted.

If you want to ship your butter, you can find reliable and first-class commission firms in these columns. They also give you all the leading firms making butter color, the best dairy salt, and other supplies. They tell you of the best

manufacturers of gasoline engines, treadpowers, dog powers, etc.

The paper carries to you the special propositions of the great mail order houses, like Montgomery, Ward & Co.; gives you the manufacturers (not dealers) of the leading feeds; tells you where you can get the best milk cans made, and the preparations made for keeping them sweet and wholesome. It tells you of the firms who make roofing and building papers, milk delivery wagons, and retail milk dealers' supplies of every nature. It tells you of good bargains in farm lands. It is a meeting place for those who want help of any kind, and those who seek employment. Parchment paper for butter wrappers is advertised.

Anyone making a pasteurizer worthy of your attention, can afford to tell you about it in these columns; it is the same with dairy tinware and sanitary dairy apparatus of all kinds; with hydraulic rams or hot air pumping machines. These columns give you opportunity to know and study over all the leading and improved cow stalls and stanchions. They tell you of the breeders and what they have to sell in all dairy breeds, and give you a chance to know their special offers when they make them; let you know where you can buy low-down wagons; tell you of all the reliable remedies for sick animals, manufacturers of the best machinery for cutting ensilage and fodder and grinding feed. They introduce you to the leading manufacturers of fencing on the market; inform you where to get stock watering basins, carriers for barn equipment, manure spreaders, and in fact every kind of machinery wanted on the farm.

In short these advertisements constitute a record of all that is old, well tested and approved, and a revelation of whatever is new and worthy of consideration.

If you do not study the advertising columns, how are you to know of these things? Do not think that all the brains and intelligence of the commercial and manufacturing world in these lines has nothing to tell you, that is worth your valuable time to read and listen to. When you reach this point move into town and let one of the boys run the farm; the youngest can fill your place.

Every reader should be interested in the advertising columns. They should be of much convenience and help, and positively worth money to him. It costs the reader nothing. A dollar's worth of postal cards, consumed in the year for information relative to things advertised, may not only effect large saving in money, but give you the satisfaction of having what you want and not having what you don't want, and the still larger satisfaction of knowing about things.

Milk Serum as a Medicine.

Monsieur Blondel of Paris read before the Medical Congress of Madrid an exceedingly interesting article on the physiological and therapeutic properties of a serum made from milk. The results of Monsieur Blondel's conclusions were reached through numerous cases in diverse infectious diseases mostly taken from among the severe ones, in which the proportion of cures obtained showed the great value of the remedy. Under its influence the appetite became sharper, and the general condition was much improved. There was a notable increase of urea, uric acid, and phosphates in the urine. As the serum has a marked action on the nutrition by hastening the process of the oxidation and disassimilation it is particularly indicated against gout. Administered the day following the attack of this disease it caused a new crisis within twenty-four hours with an enormous discharge of uric acid. The immediate effect of the subcutaneous injection of milk serum is the lessening of the pressure of the blood; on this account Monsieur Blondel found it specially indicated in sufferers from arteriosclerosis, whose stiff, friable blood vessels threatened ruptture. Its application should be progressive to avoid syncope. In 30 patients in the Hospital de' Pitie, the serum administered to subjects suffering from various infections and with temperatures varying from 39° to 31° Cent. produced a lowering temperature which never failed. In pneumonia, typhoid fever and puerperal fever there was a marked lowering of temperature.

The serum is obtained by the rapid coagulation of milk at 30° Cent. by means of an acid, neutralization by soda, and filtering by the Chamberland Porcelaine Bougie.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain sepecific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

An Ohio Ration.

I have a couple of Jersey cows that I would like a ration formulated for from the following: Corn and oats, equal parts by measure, ground together at $1.20 per 100 lbs.; bran, $1.10; middlings, $1.20; oil meal, $1.50; roughage, good clover hay and corn stover, not very good, grown on sandy soil and much of it dried up before cut. These cows get a large basketful of this hay and fodder steamed twice a day. This basket holds a bushel of ear corn and this feed is run through Tornado cutter and they eat it clean; they also have all the dry fodder and hay they will eat. Make your ration for cows weighing from 750 to 900 lbs. just fresh. W. F.
Eaton, Ohio.

It is a pretty difficult proposition to suggest a ration formula where any considerable part of the roughage is "corn stover, not very good," and equally difficult to estimate the weight of a basket full of steamed fodder. We think these cows ought to have about 15 lbs. daily of that good clover hay, and say 4 lbs. of the corn and oat mixture, 2 lbs. bran and 1 lb. oil meal, with a teaspoonful of salt night and morning. This would furnish 1.90 lbs. digestible protein, 8.85 lbs. carbohydrates and .56 lbs. fat. Add to this 6 to 10 lbs. of that inferior corn stover, or as much as each cow will care to eat, and there would seem to be no good reason why they should not do well at the pail.

A Washington (State) Feeding Problem.

I am feeding my grade Jersey cows all the good clover and timothy eay they will eat, some beets and about 6 pounds ground oats and barley per day. Three of them are nearly fresh, two more coming in soon, give on an average 20 to 24 pounds of milk a day, each. Not being satisfied with results I want you to formulate a balanced ration, as near as possible, out of following:
Hay, barley and oats at $1.25; bran, $1.10; oil meal, $1.75 per 100 lbs.
Would it be to good advantage to feed ground wheat that is mixed with vetches and wild oats to cows, or would it better be used for hogs and chickens? SUBSCRIBER.
Washington.

We estimate that these cows are receiving not to exceed 1½ lbs. of digestible protein daily, which is about enough to suffice for 20 lbs. of 3 per cent milk. We suggest that the amount of protein be increased by adding 1 lb. of oil meal daily for the lightest milkers and 1½ to 2 lbs. for those giving 25 lbs. or more of milk.

Whether the mixed grains mentioned would be better than barley and oats would depend upon the amount of vetch seed present. It might be tried in a small way with a part of the herd and results observed for future guidance.

Amount of Cream from Milk.

The same inquirer asks how many quarts of cream can be had from an 8-gallon can of milk testing 4 per cent fat. This, of course, will depend upon how rich a cream is desired. Ordinary market cream usually contains from 20 to 25 per cent fat, while cream for best results in churning should contain not less than 30 to 35 per cent fat. Eight gallons of 4 per cent milk will weigh 68.8 lbs. and contain 2.75 lbs fat, enough to make nearly 6 quarts of cream 22 per cent fat, or 4½ quarts 30 per cent fat.

An Illinois Feeding Inquiry.

Please form me a balanced ratiin for cows weighing about 900 lbs. apiece, which will be fresh in April and May. For feed I have good corn silage and dry brewers grains and mixed hay, mostly clover. Dried brewers grains are $17 a ton. How would it be to buy good clover hay at $8 a ton to feed with the silage and not feed any grain, and how much clover and silage should be fed daily? H. B.
Glenn Ellyn, Ill.

Cows that are to be fresh next spring cannot be expected to be very profitable producers now. If they barely pay for the cost of the feed consumed they may be considered as doing fairly well. Good clover hay contains approximately 46.4 per cent of digestible nutrients, and dried brewers grains, 63.5 per cent. Clover hay at $8 is therefore much cheaper than the dried grains at $17. It does not necessarily follow that silage and clover hay would be the most economical ration, for possibly the cows could not eat enough of the roughage to enable them to produce up to even their present capacity as strippers. If they could be induced to eat 30 lbs. of silage and 12 lbs. of clover hay daily, one ought to expect in return from 10 to 12 lbs. of 5 per cent milk, or say ⅔ of a pound of butter, at an expense for feed of 10½ cents. For cows that can do better than this add 2 to 3 lbs. of the dried grains.

California or Tennessee for Dairying.

Will you be kind enough to advise me through the columns of your paper or by letter, which section of the country is best for dairying, California or Tennessee? Are prices better in California and the west, or are they the same as here in Memphis? Do cows do better in the west than here? A. M. H.
Memphis, Tenn.

Doubtless each locality has some advantages not possessed by the other. Choice dairy products probably bring better prices in San Francisco than in Memphis, but see our market columns for greater certainty. It is safe to say, however, that generally this is a world of compensations, and, as Dr. Holland said years ago, "Cost of worth, is closest neighbor." Where it costs most to produce milk, there milk and butter and cheese usually command the highest prices. Excessive competition or local conditions may for a time supersede this general law, but reaction is almost sure to follow and the pendulum of prices swings to the other extreme, temporarily. On the whole, therefore, it may be said that it is not so much the locality as it is the man, that determines the degree of profit in dairying.

A Query Concerning Silo Construction.

Will you advise me through the columns of your paper if the following idea in silo construction is practicable. I wish to build two silos this spring—about twenty feet in diameter and thirty-six feet high.

Can I build these of two by six pine joists, set edge wise twelve inches from centers, with two by four ties or braces between studs—covering both inside and outside with expanded metal lath and an inch of strong portland cement,

This will certainly be impervious to air and cheap to build. Will it have resistiug power to withstand wind when empty? Would it help to anchor the foot of the studding in cement?
Rockford, Ill. W. C. T.

Silos built as suggested would not be likely to withstand the lateral pressure of the silage, unless reinforced by wooden or other hoops on the outside. If the outside was covered with two thicknesses of half-inch boards with paper between and thoroughly nailed to the studding, and the inside finished as suggested, we should expect very perfect silos. But why not go down to Mr. Gurler's place at De Kalb and take a look at his silos?

How Many Cows on Sixty Acres?

I have a small farm of sixty acres; how many cows can I keep on it? M. J. E.
Buchanan, Mich.

If the entire sixty acres is in productive form, you can, by proper management, keep 25 cows, 2 horses and a limited number of young stock. But to do this one must practice intensive farming, and allow nothing to go to waste, or many square feet of ground to be unproductive. The ordinary farmer would probably limit himself to not more than 15 cows, and rather less than more.

Close Breeding.

I would like to know if it would be injurious to the offspring to use a bull with a cow whose dam was by the same? G. S. S.
Livermore Falls, Me.

Not at all, provided the bull is individually and by inheritance what he ought to be. We believe the true rule ought to be: Use the best bull you can have, regardless of consanguinity. Many of the most noted animals have been the product of mating full brother and sister, or sire or dam with their own offspring. But if there is any weakness or other defect, beware of mating closely related animals.

Prices and Qualities of Oil Meal—A New York Ration.

How much difference should there be in price between two brands of linseed oil meal, which analyze as follows:
No. 1—Protein, 36.70: fat, 8.63; retails at $35.
No. 2—Protein, 32.50; fat, 6.50; retails at $30.
Please formulate a ration for cows in full milk from ensilage made from matured corn with a fair quantity of grain in it. Hay, mixed timothy, red top, some clover, daisies, etc, etc., mixed $10; feed, bran and middlings, $22; oil meal, No.1 $35; No. 2, $30 as in above question. Bran, $20; flour middlings, $24; corn meal, $20: oats, $25.
Fernwood, N. Y. J. D. B.

When we purchase linseed oil meal, it is largely, if not exclusively, for the protein and fat. If, therefore, the two kinds of meal are equally fresh, sweet and palatable, the difference in the prices named correspond almost exactly with the difference in analyses.

The hay mentioned is of such a character that no one would be justified in carrying out its feeding value in figures, but it will probably answer every practical purpose to suggest feeding daily 30 to 40 lbs. silage, 5 to 10 lbs. hay, 4 lbs. bran, 2 lbs. corn meal and one lb. to two lbs. of the oil meal, and in our judgment the No. 2 would prove satisfactory.

Stale Bread for Nebraska Jerseys.

Wheat bran, $12; corn and oats, ground, $16, and prairie hay, $5 per ton. Would you please give ration for dairy thoroughbred Jerseys, 700 to 900 lbs., in different periods of lactation.
Can old dry bread be fed to advantage, and in what proportion? It costs nothing.
We are highly pleased with benefit derived from your paper. R. M.
Norfolk, Neb.

There would seem to be no reason why stale bread, if not moldy, might not be used in limited quantity for feeding milch cows, although we have to confess that there are no recorded experiments on this point. It is our opinion that these cows would respond favorably if there was added to the feeds named 1 lb. to 2 lbs. linseed oil meal daily. In the absence of the succulence furnished by silage or roots, oil meal appears to confer benefits out of all proportion of its mere nutritive value. We therefore suggest for trial, as an average daily allowance for these cows, 3 lbs. stale bread, 3 lbs. bran, 2 lbs. oil meal, and hay *ad libitum*, with salt morning and evening.

Questions in Breeding.

We have in our herd (26 head in all) some very fine full blooded Jersey cows, also some grade Jerseys and 2 full-blooded Jersey bulls, past seven years old, the other one will be one year old this coming spring. We also have 5 heifers we are raising from the old bull, and as we have been raising one or two every year from our best cows, we intend to continue to do so for the improvement of our dairy in the future.

Will ask you (as we have had but very little experience in in-breeding) would it be your advice to dispose of the old bull when the young bull is large enough to take charge of the dairy, or would you keep the old one? The old bull is the sire of the young bull.

I would like to ask also if a full-blooded Jersey bull is bred to a full-blooded Short-horn cow, and then again to this same cow's offspring, and so on, could you ever get a full-blooded Jersey calf? If so, how long would it take?
I say, "never;" my neighbor says, "yes."
Wheeling, W. Va. W. J. L.

See answer to G. S. S., of Maine, where the first question is briefly discussed. If the dam of the young bull is a full-blooded cow, and a satisfactory performer at the pail, the chances are he may be an improvement on his sire. On the other hand, if the dam has more or less native or scrub blood coursing in her veins, the probabilities are that some of the young bull's get will hark back to those ancestors and not prove profitable producers. It is this probability which makes it unwise to use a grade sire, notwithstanding his dam may have been a superior cow.

No animal can be registered in the American Jersey Cattle Club's book that cannot trace an unbroken pedigree through sire and dam to Island bred ancestors, and no number of crosses can make a full blooded Jersey where there is a Short-horn dam in the back ground.

Acid for the Babcock Test.

Will you please tell me whether the sulphuric acid sold here in our drug stores is all right for use in testing milk? If not, what is wrong?
Martin, Tenn. K. C. H.

Have the druggist try the specific gravity of the acid. If it is 1.83 the acid is all right for testing milk; if it is lower than 1.83 it should not be used in the Babcock test.

Electric Light for the Farm.

We have a creek running through this ranch which would furnish ample water power. We are thinking about putting in an electric light plant. Will you please tell us through the DAIRYMAN where we can get the necessary machinery? E. W. McC.
Big Horn, Wy.

Write to the General Electric Co., of Chicago, Ill., or the Fairbanks-Morse Co., of Chicago, Ill., for information on electric apparatus for farm lighting purposes.

Water Power From a Fish Pond.

I have a fish pond that is half an acre in area. I measured the water according to the Weir measurement, and it runs 10 inches by 1 inch, which is a 10 square inch flow. I can use two feet deep of the pond. My race will be one hundred and twenty yards long. I have sixteen feet fall, and use a 16-foot overshot wheel and can get two additional feet fall by lowering the branch, which will give me 16 feet clear fall from the bottom of the race.
McDonough, Ga. J. B. L.

The power would be sufficient to run a 6-horse power silage cutter for between two and three hours; depending on the efficiency of the water wheel, before it would be necessary to allow the pond to refill.

A Half Yearly Herd Statement From Prince Edward Island.

ED. HOARD'S DAIRYMAN:—While our cows are bringing us just now the magnificent profit of 5 cents per day each, and bids fair to be much less by the time this catches the reader's eye, and by the end of January be probably a minus instead of a plus, it has not been always thus, as the tabulated statement hereunto annexed very forcibly shows.

Our statement embraces a half year, or six mouths only, and of course is not a criterion of the yearly profits and losses of the herd. It was not possible to give a yearly statement without much estimating, as no account of the milk product of the herd was taken before June 15th. It could be estimated no doubt, but in that case it would be unfair to set values on the product, for during the months previous to June 15, the milk was fed, fresh from the cows to hogs, and it is difficult to estimate its value used in this way.

For several years past we have been in the habit of feeding the milk in the months of April, May and part of June to our breeding hogs, that is to young pigs from three weeks up. Last spring we made no other use of the milk. All we had was fed the pigs, except what was needed in the house, and no butter was made made till after the fifteenth of June when the milk began to go to the dairy and be weighed. We keep cows because we keep hogs, and we keep hogs because we keep cows.

Most of the cows freshen in the spring and early summer months with one exception, while one failed to freshen at all. The tabulated statement herein given was no simple job to get out, and cost the writer the best part of two days to complete. It is believed to be original, comprehensive and succinct.

Day of Guelph, the greatest authority on hog feeding we have, does not think so either. By the average method of feeding whey by the patron, it is not worth half of 14 cents however.

"Skim milk." Of skim milk, we had 6,366 pounds which we valued at 24 cents, which is probably below its actual value to us, gravity skim milk as it was. It is said that Armour makes his profits by the by-products. We believe we would make very poor showing were it not that we utilized the by-products to the very best advantage. The value of the by-products, whey and skim milk, paid half our feed bill, and if the home-made cheese was included in the by-products, which it legitimately should be, and may be, the by-products of our dairy paid five-sixths of our feed bill. This should be an eye opener to some of our dairymen. These by-products, whey and skim milk, are charged to our hogs at these figures, the same as the meal bought and fed them, while the cheese at 7 cts. is actually lower than sales we have made.

Without the by-products, dairying would be a poor business indeed for us. About 75 cents per cwt. would be what we could get out of the milk either in butter or cheese, creamery or cheese factory. At this price, our cows for the last month or two would as much as ever pay for their feed. At this minute, Dec, 15th, they would not do it at all, as they do not now give milk enough to pay for their feed, let alone a profit. In fact with the additional value of the by-product they are not this minute more than doing it. It costs 11¼ cents per day to feed each cow, and to pay this the cow would need to give nearly 16 pounds per day, at the price for milk alone, 75 cents per cwt.

For these reasons it will be our aim to stop milking our unproductive cows pretty soon now, and only keep on milking those that pay for their feed at some

SIX MONTHS RECORD OF HERD; NATIVES, JUNE 15 TO DECEMBER 15, 1903.

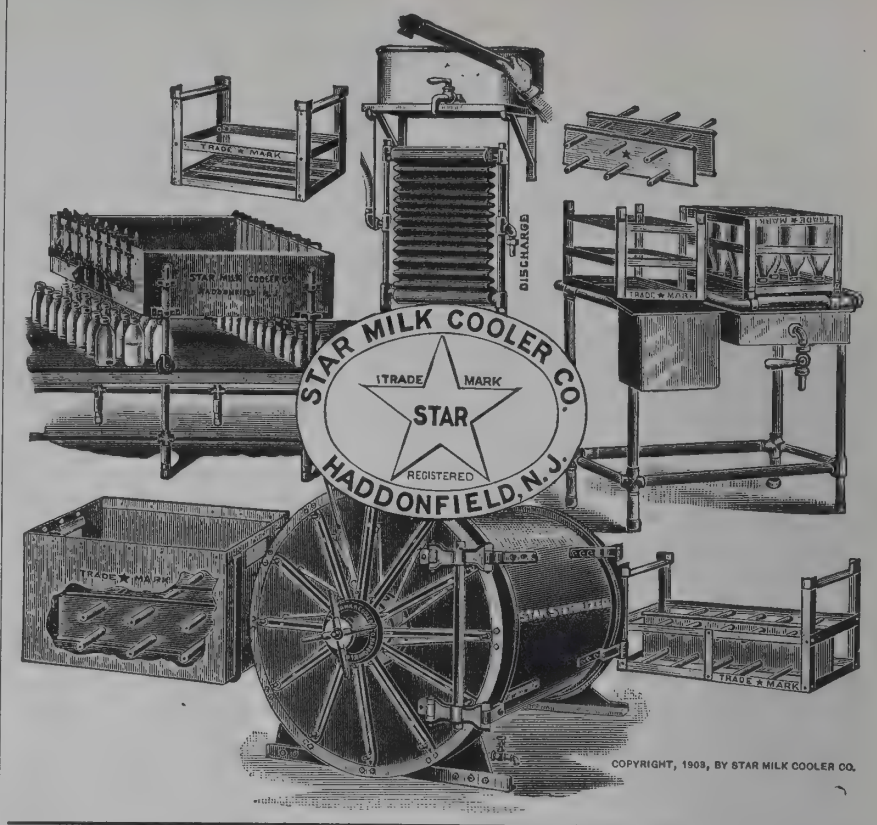
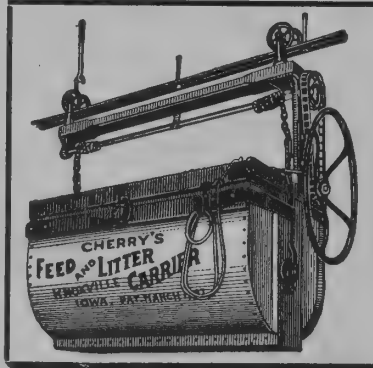
A word of explanation of some of the terms may be necessary. "Milk manufactured into butter." The value of this was based on butter at 20 cents per pound. "Milk manufactured into cheese at factory." This is the net amount paid by factory, which was 75 cents per cwt. of the milk furnished. "Milk fed to young pigs, and used in household." This was valued at 75 cents per cwt., the price which the factory paid. "Total by months" gives the amount of milk of the milking herd in each month. "Milk per cow per day." The average here began at 22.6 and ended at 15.6 lbs., which shows that none of our "natives" are phenomenal milkers; but shows the "staying power" of our cows very well, and that they are at least persistent milkers.



"Cheese home-made," only began after we stopped hauling milk to the factory in early October, something which has already been said in late numbers of the DAIRYMAN. The amount here given is the total amount made and is certainly a bargain at 7 cents per pound, as factory retails for 16 cents. This should be termed, perhaps, a by-product. However, if we did not curd our skim milk, we would have to add twenty-five cents or more for the butter fat it contained, set as it was by gravity process. "By-products,"—Whey, in rating whey at 14 cents per cwt., some may consider it too high. We do not think so, after feeding 12,000 lb. of it in the past six months, and Prof.



little profit, then with our small herd it will not be worth while attempting to make butter at all.

"Net value per cow per day." We think this is a good showing; June, 23 cents per day, falling to 19 cents per day in October and November, and December 16 cents. The average for the six months is not far from 20 cents per day for each cow in our herd. Coming down to "net profits," our cows show up very much brighter, and it is here that our herd compares with the best. It is not the cow that gives seven or eight thousand pounds milk and eats up the profits, that we want. It is the final balancing up that tells the business man, or business farmer, how he stands. It is not the merchants that sell the most goods that comes out at the end of the year with the largest profits. We know something of this.

CHARGES AND EXPENSE.

"Pasture," this is very low charge, but it is actual nevertheless. We have a neighbor's farm at a nominal rent for pasturage only, and what pasture of our own only interest is charged, and the milking cows charged proportionately with the other kinds of stock, horses, pigs, sheep, etc. "Grain and Meal," this is also a low charge. The secret of this is that by a little foresight, and watching the local newspaper we were enabled to purchase our feed very cheap according to prevailing market prices.

CHERRY'S
Perfected Barn Equipments

Consisting of Manure Carrier, Feed Carrier, Ensilage Carrier, Grain Elevator, Swivel Hay-Carrier, Hay Forks and Barn Door Fixtures. This system of carriers is built for **Heavy Work** and **Durability.** By the use of our **Curves** and **Switches** we can equip any barn. Send for illustrated Catalogue H and price list to

CHERRY MFG. CO.,
KNOXVILLE, IOWA.

It Depends On the Wrapping

whether butter comes sweet to the table. If you would shield yours from the deleterious odors it encounters—you know how quickly butter absorbs odors—and preserve its own delicate flavors, wrap the prints and line boxes and tubs with

Pioneer Brand
Parchment Paper.

It's the ideal butter preserver. Pure vegetable parchment, no smell, no taste. Name of brand printed on sheets so it will not discolor, if desired. But there are parchments and so-called parchments. See that yours is the **Pioneer Brand.** Write us for free samples and book, "Better Butter."

32 years ago we occupied one room with two clerks and published a catalogue a quarter the size of a hymn-book.

"Grandfather Traded With Us"

One of the greatest joys of this great business is the many kind letters we receive daily from our customers, expressing their pleasure and satisfaction with our goods and methods.

Often the most significant part of the letter is embodied in the few words: "My grandfather traded with you years ago." It is the complete confidence of our customers in our honesty, born of past experience in dealing here, that enables us to hold their continued trade.

One-time special "below cost offerings" to catch an occasional customer, and making up the loss on subsequent orders, would never build a business like ours.

It is the constant saving and steady stream of pleasant business relations which makes our patrons eager to speak a good word for us at every opportunity.

Our prices are 15 to 50 per cent below regular retail figures.

We Want You to Try Us

and test for yourself our ability to please you. Tell us what kind of goods you are interested in and we will send you without charge any of the following illustrated special catalogues quoting wholesale prices. Merely mention the number or letter of the catalogue you want.

100 Artists' Supplies
105 Athletic Goods
110 Blacksmiths' and Machinists' Tools
115 Builders' Hardware and Supplies

Complete satisfaction or money refunded without question.

Our ground corn was purchased delivered at our Station, in ton lots, at $22; ground oats, $20. These were the feeds used, with a little bran and whole oats.

"Green feed, roots and roughage." Green feed was valued at $2.50 per ton, and roots, except potatoes, the same. Roughage consisted of corn fodder while it lasted after being cut, and oats in the sheaf and good hay. Oats in the sheaf is our principal food. The only trouble with sheaf oats is that cows will eat no other feed if they can get sheaf oats, not even hay, sometimes not even meal, and they will eat so much of it that it becomes a dear feed. I actually believe there is no other feed grown under God's sunshine that will compare with sheaf oats for a cow giving milk. It is laxative; it is sweet; it is nourishing; it is wholesome; it is the *creme de la creme* of milk-giving foods,—but it is a dear food,—*dear* in what ever meaning you take for the word.

Who says winter dairying pays better than summer dairying? Not I, I can feed a milk cow for 4c. per day in June, while the same cow requires 11¼c worth of feed in December; 4.6c. per day in July and 10c in November; I would need to get quite an extra price in November and December over June and July, indeed, to make an equal profit.

Our net profits held out very well until we began putting our cows on winter rations November first. Then the fall began. A profit of 12½c. per cow per day, in the month of October, for an average was certainly encouraging. 6c in November was not so bad either. on the whole, the net profits of the six months are satisfactory.

The "finals" show that for one dollar's worth of feed, we were able to get $3 in product from our herd. When cows are giving only milk enough to make a half pound butter or less per day, it is given as a rule by some authorites to feed about as much grain per day, as the cow gives in butter per week. If a cow gives but ½ lb. butter per day, this would mean feeding her 3½ lbs. meal or grain per day.

It is our experience that when a cow shrinks below ½ lb. butter per day, it takes more than 3½ lbs meal per day to keep her from rapidly shrinking below that. So this rule is of no value. A cow needs a good ration every day she is giving milk, and 3½ lbs. meal is but a bagatelle as a part of a winter ration. To base the grain ration therefore on the product of butter, daily, when the cow is is sometime in lactation, and on winter ration, is erroneous. We believe five lbs. of concentrates is the minimum that any cow should be expected to work on in winter, as none of our cows are getting so little as five lbs. of grain, is probably why our direct profits, just now, don't show up better.

Another important question to dairymen is this:

If a cow is not just paying for her feed, is it right to stop feeding and milking her? Of course I mean a cow well along in lactation. Did such a cow give no milk at all, would she not have to be maintained? A maintenance ration means 15 to 20 lbs. dry matter, of which, at least .75 is protein. Does this cost nothing? A maintenance ration for a cow is about 20 lbs. of hay, worth any where from 8c. to 10 or 15c., say 10c. as an average. Here then, is a straight loss, so to speak, of 10c. per day right along. Now, if by the addition of 5c. worth of meal per day, we are able to get 10c. worth of milk, is not the adding of the 5c. worth of meal a good investment? By feeding the hay only, we got no product; by feeding meal in addition, we get 10c., thereby reducing the daily cost of feeding or wintering our cow just one-half. When the cow was a non-producer, she cost us 10c. per day; when we kept her along producing, she cost us but 5c. per day. This is a business proposition that should be easily understood.

What matter, therefore, if our own cows do not pay exactly their daily feed cost? Were they non-producing, as 75% of the cows of the country are this minute, they would be costing us about double what they now are. Another thing: If our cows are not showing any profit, does that mean a loss? By no means. If the cows are about paying their way, are we not getting market prices for our feed, and particularly our roughage, at our very doors? Should we not be at least satisfied if our cows, sheep and pigs pay market prices for our farm raised feed? Yes, and the purchased feed, too? Are there not some indirect profits from feeding our crude products on the farm, rather than market them by the bushel or cwt.? J. A. M.

Old Cows and Milk Fever.

ED. HOARD'S DAIRYMAN:—I see in the DAIRYMAN of Dec. 18th inst a communication headed, Stock Troubles, and signed W. R. Gilbert, in which he states that it is a matter of common knowledge that young and old cows are seldom attacked with milk fever. In the former I agree with him but the latter is altogether contrary to my experience.

I have kept from 40 to 80 cows for more than 12 years. During that time I suppose that I have lost with milk fever from 12 to 15 fine old cows, none of them under 9 years old and the majority of them more than 10 years old.

Norfolk. Va. F. A. M.

Did You Ever Keep a Record Of Your Cows?

IF SO, you have felt the need of a convenient, simple and handy Record Sheet. We have had so many requests for these Record Sheets that we concluded to get up one that would "fill the long felt want."

DAILY MILK RECORD SHEET FOR TEN COWS

We have a very simple and complete Record Sheet for 10 cows, one month, that is printed on heavy Manilla Paper, we can send postpaid at the following prices:

Price 5c Each	6 for 20c	12 for 30c	25 for 50c

SIZE 10x16 INCHES

We also have a one cow Record Sheet, heavy Manilla paper (one month) that we will mail postpaid

Single Copy 5c	5 for 15c	10 for 25c	25 for 40c

SIZE 6x15 INCHES

HOARD'S DAIRYMAN.
FORT ATKINSON, WIS.

The Distribution of Skim Milk.

It is known that the just complaints of creamery patrons on account of unfair distribution of skim milk are the bane of the separator creamery business. Further disputes among patrons, annoyances to managers, hindrances to the best work of buttermakers, watering the skim milk, and many other ills in the same train are unnecessary, since the

Barber-Coleman Check Pump

has for more than five years been successfully solving the problem in many different creameries. When a patron has dropped in his check he can pump the amount of skim milk called for by his check, less the percentage taken out as cream, so in like proportion to all other checks. Its measuring apparatus is just an ordinary pump which everyone understands and knows how to operate.

Gasoline Engines.

ED. HOARD'S DAIRYMAN:—Enclosed find my renewal and four new subscribers. You publish a great paper. Am getting my neighbors interested in HOARD'S DAIRYMAN and hope soon to have a good respectable list of readers here for you.

I'm in a quandary about buying a gasoline engine. The DAIRYMAN has had a good deal to say about this kind of power and I am convinced that it is about the only power for a dairy farmer to buy. Can't you tell me the best engine.

Ohio. Z. E. TRAVIT.

We thank our friend for his helping us to an audience in his neighborhood. We want to preach the true dairy gospel everywhere. The backsliders and sinners from the ways of sound, good, practical dairy sense have a strong hold on some communities and the dairy morals need an exhorter, that is "sot" in his faith, to rouse them to even a suspicion that they can do better.

As to gasoline engines we can say that we do not know which is the best, and further might say that the success of a piece of machinery depends not alone on the manufacturer, but as well on the user. A gasoline engine is very simple in its principles and mechanism. The first thing for you to do is to write to different manufacturers for their circulars and prices for different sizes within your needs. Get your material together and take an evening for looking them up. If it is not worth this trouble, you certainly don't need the engine.

The columns of HOARD'S DAIRYMAN contain much gasoline engine advertising, and we may say, without reserve, that they are among the best manufacturers of these goods in the country. In the last few months we have refused advertising of gasoline engines from a number of irresponsible firms. We do our best to keep these columns so they will be of practical value to our readers.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—Today the Quotation Committee of the Elgin Board of Trade reported the official market firm at 24 cents. There were no offerings and no sales.

Prior to the opening of the Call Board, the directors met and re-elected the following officers: President. John Newman; Vice-president, G. H. Gurler, Treasurer, W. W. Sherwin; Secretary, L. B. Judson.

The former markets were:

	Tubs sold.	*Price.*
Dec. 21, 1903	145	24
Dec. 29, 1902	0	29
Dec. 30, 1901	0	24½
Dec. 31, 1900	0	24½
Jan. 4, 1899	0	26½

The output for the district is 440,700 pounds. H. C. B.

Elgin, Ill., Dec. 28, '03.

Paying off a $3,500 Debt.

Mrs. Chas. Lamont tells How the Way was Found Through the Farm Dairy.

The following paper by Mrs. Chas. Lamont of Mooresville, Ind., read at the Indiana State Dairymen's Convention, is of interest as showing how the dairy—whether the butter is churned at home or milk sold to the creamery—will pay off the farm debt if given a chance under intelligent direction. Mrs. Lamont entitles her paper, "Building Up a Dairy." How well the result was accomplished is told as follows:

To save us moving in quest of a suitable position, we, five years ago, went in debt entirely for our farm of seventy acres, as well as for nearly all of the cows, horses and farm implements with which to begin work, and even for feed to carry our stock over the approaching winter. It was rather a large undertaking for us to face a debt of $3,500 for the farm alone, with the very small cash capital we possessed, but we were firmly convinced that we could and would succeed, and strange as it may seem, while lack of knowledge of the dairy business has been our greatest obstacle, we have never really suffered for want of financial aid; perhaps because we have made it our business to discharge all obligations at the time agreed on and so kept our credit good. We had a retail butter route all ready to step into, otherwise we would scarcely have made the venture. We bought a sufficient number of Jersey cows to supply our trade—one here and one there just wherever we could, but mostly from dairymen who were going out of the business, and we put in a cream separator and modern butter-making appliances. There was what seemed an epidemic of abortion among the dairies around us at the time and our small herd had the disease from the first. Several of our cows lost their calves and of these cows some gave very little milk afterward. But the greatest trouble was that so many of them failed to breed, either for a long time or not at all, and these last we had finally to dispose of and replace with others. We sent away for a remedy much advertised for the cure of abortion, but we relied most on keeping the cows clean and disinfecting the premises with lime and carbolic acid, and after some months the disease died out.

We lost two cows from milk fever the first winter. They were allowed to take on too much fat before calving. These losses were far from being encouraging, but they taught us a lesson in care we have not yet forgotten. We do not now allow a cow to go dry more than eight weeks before calving, and keep the bowels loose before and at the time, by the aid of Epsom salts, it necessary. Feed sparingly for several days after calving and give warm bran mashes, and warm the drinking water, and no matter what kind of weather, the cow is kept housed for three or four days after she calves, and now milk fever does not possess the terror for us it once did. The heifer calves are left with the cow not more than three days and then are given the mother's milk for a week or two and are afterward fed warm skim milk until they are as much as six months old. We seldom feed anything in the milk, though at present we are giving a little corn meal alone and sometimes we have used linseed. They soon learn to eat clover hay and grain and we have had little trouble with scours.

Our cow barn is a very ordinary affair, but by the use of whitewash, cemented gutters behind the cows and daily cleaning, we keep it in a fairly sanitary condition; and by using building paper along the inside walls, and other aids, we manage to keep the cows comfortable during the cold weather.

At the end of the first year we built a stave silo just outside the barn and the cows are fed ensilage from November (often before) until they are turned on pasture in May, with clover hay, corn stover and wheat bran, to make up the winter ration. All of the feed, with the exception of bran, is grown on the farm, and no grain is sold off except wheat. We give salt daily, and bed with wheat straw. We allow a little bran or corn at the milking time all through the summer. When the grass gets short in in July, we generally feed some clover hay and an added allowance of grain, until the second crop of clover is ready to pasture, and we also feed some green corn in its season, but here we must confess that too often our cows are let shrink in their milk-giving before the green feed is ready—even more than the heat and the flies are excuse for—and it is our intention to put up a smaller silo next summer and fill with corn for summer feeding. In this way we think we shall be able to provide for our cows better than any other, as well as materially reduce the summer grain bill. The manure is drawn out and spread on clover sod as often as convenient.

We have always kept a registered Jersey sire to head the herd, and we save the heifer calves from what we judge are our best cows. Two-thirds of the herd are at present composed of young animals of our own raising, and we now expect to raise all the cows we may require. While more of our cows freshen in the fall and winter months, we have some of them bring their calves at different seasons for the reason that it helps to keep the butter good and also to keep up a certain supply the year round. The heifers usually freshen when twenty to twenty-four months old. The skim milk left after calves are fed, as well as the buttermilk, is fed to the pigs. Of these, we try to rear twenty-five to thirty-five twice in a year. These are, we find, a profitable combination with the dairy.

We have a weigh scale hanging in the barn, also sheet of card board and pencil, and the milk of each cow is weighed at every milking and a note made of amount, so we know just how much milk each cow gives in a week or a year, and we test the milk occa-

Tables for Reference

In planning the "grain" portion of your ration, consult the following table:

One hundred pounds of			Contains Protein
Ajax Flakes	equals	**135** qts.	**34** lbs.
Gluten Feed	"	80 "	26 "
Wheat Bran	"	200 "	16 "
Wheat Middlings	"	120 "	18 "
Fancy Middlings	"	110 "	19 "
Feed Flour	"	100 "	20 "
Wheat Mixed Feed	"	140 "	17 "
Cottonseed Meal	"	70 "	43 "
Linseed Meal	"	90 "	34 "
Hominy Feed	"	80 "	11 "
Corn	"	60 "	9 "
Corn Meal	"	70 "	9 "
Corn and Cob Meal	"	70 "	8½ "
Clipped Oats	"	90 "	11 "

The table can be used as follows:

	Equals	Contains Protein
100 lbs. Cottonseed Meal	70 qts.	43 lbs.
200 " Bran	400 "	32 "
300 " Corn Meal	210 "	27 "
	680 qts.	102 lbs.

You have a mixture containing 102 lbs. of protein in 680 quarts; hence, to feed the necessary 1½ lbs. of protein, which you do not get in your roughage, you should feed about 10 quarts per day of the above mixture. The carbohydrates will also be brought up to practically the required amount at the same time.

WISCONSIN FARMERS' INSTITUTE BULLETIN NO. 17

Is now ready for distribution. A 320 page hand-book for the farmer and stockman. Treats of the dairy, sheep and swine husbandry, horse breeding, poultry, fruits, etc.
To Wisconsin farmers—25c for cloth bound and 10c for paper covered copies. Outside of Wisconsin—40c for cloth bound and 25c for paper covered copies.

Address GEO. McKERROW, Supt., Madison, Wis.

A Planet Jr. For Every Garden.

The No. 25 Planet Jr. is a combination tool for large family gardens. The illustration to the left suggests its several uses as Hill and Drill Planter, Single and Double Wheel Hoe, Cultivator and Plow. In planting in hills 4, 6, 8, 12 or 24 inches apart, in drill seeding, killing weeds, scuffling, cultivating, furrowing, ridging, working between and astride the rows, it combines in one tool almost universal usefulness in the garden.
No. 16 Planet Jr. is an admirable Single Wheel Hoe, Cultivator, Rake and Plow. Note its equipment. Its handles adjust for height, the wheel for depth, and by setting the wheel to one side both sides of the row can be cultivated at one passage.

Planet Jr. 1904 Catalogue

shows forty different machines, including Seeders, Single and Double Wheel Hoes, Hand, One and Two Horse Cultivators, Horse Hoes, Beet Sugar Cultivators, etc. Over 100 illustrations, including 16 beautiful half tones of home and foreign farm and garden scenes. Mailed free to all.

S. L. ALLEN & CO.,
Box 1107-D
Philadelphia, Pa.

sionally to find the percentage of butter fat it contains, which enables us to know which are our most profitable cows. By using a corrosive sublimate tablet to each sample, we now collect a sample of each cow's milk for a week or perhaps less in hot weather and then test with little more trouble. We think we get a more correct test than when taken for only one day. (For this method we are indebted to Professor Van Norman.)

The first year's record could not be called a fair test of what our cows have done, but the second year they gave an average of 255 pounds butter each. Last year they averaged 290 pounds each. They will almost, if not quite, reach the 300 pound mark this year, though there are four heifers included in the herd. We have at present fifteen cows and a number of in-calf heifers and calves.

We have much to accomplish yet beore we have either a dairy or a farm we can feel proud of, but as a result of our little herd and its products, our debt, so long like a black cloud hanging over us, is steadily decreasing. Our farm is yearly growing more productive. The herd itself is increasing and we have a ready market for all our butter, and we are a little at a time putting in much needed improvements and planning for more extensive ones in the future.

Picking Stone with a Grub Hook.

ED. HOARD'S DAIRYMAN:—Some time ago one of your contributors inquired about a machine for picking stone. I have found the common grub hook, used by hop growers, a great help. It is similar to the hoe, having four strong tines in place of a blade. With this, a man can pick stone when it is wet or frosty, and when they are sod bound. It saves hands and back, and if manufacturers would only shape the tines a little hollowing, it would be an admirable substitute for the hand, and vastly better than a fork, which is sometimes used. L. M. STJ.

Canajoharie, N. Y.

Handling a Bull.

ED. HOARD'S DAIRYMAN—W. W. G., on page 1013, gives his plan of handling a bull. We are now using our fourth pure bred Holstein-Friesian bull—the present one—Sir Mercedes DeKol 27097, four years old, and our plan has been so successful we would like to give it to others.

Our idea is, that it is partly through fear that a bull first thinks of fight and mastery. While he may be kept in subjection through fear, he would like to be master of those he fears. With that idea in mind, we commence with a bull to not be afraid of our hurting him. We do not encourage him to play with us. Just simply be kind to him. If we want to catch him, offer him something to eat. Never drive, or try to corner him. Cornering a bull is the quickest way to offend him. While we are careful not to offend we never let him think we fear him.

We do not think it best to let him run with the herd, for it is there he is liable to get it into his head that it is his business to protect the herd and will take offence, when if alone he would not. Before he has a chance to get into any bad habits we put a ring in his nose, a heavy, not a light, ring; if you do when he is full grown he will break it; 3-8 wire is light enough; then put him in a strong yard.

When we want to lead him to water we take a small ear of corn, get him to take it from our hand. As he takes the corn we take him by the ring, fasten the staff. We have a soft rope, binding twine rope, fastened to the staff, so if he pulls the staff out of our hand we have the rope to fall back on. We use a short staff about 5 feet long. It is handy and less liable to get broken. We feed from the outside. Open the door only when we want to catch him; in that way he learns to come to the door to be caught.

Our present bull is very playful and has several times got the staff snap out of the ring, but as soon as he finds he is loose stops playing and comes up to see if we have got something for him. No matter how he gets loose, or where he is, as soon as he sees one of us he comes right up to us.

To handle a bull this way we have got to get their confidence and keep it, in getting him where we want him. Sometimes he is lawless, but we get along with that without losing our temper and so does he, and this plan has never failed with any bull we have ever owned. There may be other ways as good as this to handle a bull, but we have never tried any that has worked as well. But always keep on the safe side of a bull. Do not get where he can take the advantage of you. M. F. P.

Marshall, Wis.

DAIRY MARKETS.

ELGIN, Ill., Dec. 28—Butter ruled firm and unchanged on the Board of Trade today, selling at 24c a pound, the sales in this district for the week were 440,700 pounds.

CHICAGO, Ill, Dec. 28—Butter—Steady; creameries, 16@23c; dairies, 14@21c.

Cheese—Steady; Daisies, 10¼@10½c; Twins, 10c; Young Americas, 10½c.

Eggs—Easy; at mark, cases included, 26@27½c.

Cattle—Choice to fancy beeves, 1,200 lbs. up, 5.55@5.75; good to choice heavy steers, 4.85@5.50; fair to good export and shipping steers, 4.00@4.35; medium beef steers, 4.00@4.35; plain beef steers, 3.60@3.90; common to rough, 1,000 to 1,200 lbs. 3.00@3.50; good to fat heifers, 3.60@4.35; good to choice feeders, 3.25@4.00; good to plain stockers and feeders, 1.75@3.25; fair to good cows and heifers, 2.70@3.50; good cutting and fair beef cows, 2.30@2.75; common to good canning cows, 1.35@2.25; bulls, poor to choice, 2.40@4.50; calves, good to fancy 5.75@6.50; calves, common to fair, 2.75@5.00; corn-fed, western steers, 4.00@5.40; Texas bulls and grass steers, 2.25@3.75; fed Texas steers, fair to choice, 3.40@4.50.

Hogs—Good to choice heavy shipping, 4.70@4.85; fair to good heavy packing, 4.60@4.75; rough and common heavy mixed, 4.35@4.55; assorted light, 150 to 175 lbs., 4.60@4.75; good to choice butcher weights, 4.80@4.90; fair to choice light mixed, 4.50@4.70; thin to choice 50 to 120 lbs., 4.20@4.85; stags and rough lots, 3.00@4.30.

MILWAUKEE, Wis., Dec. 28—Butter—Creamery, extras, 24c; firsts, 22@22½c; seconds, 20@21c, renovated (process), 17@18c. whey, 10@12c. Dairy fancy, 19c; lines, fresh, 16@17c; packing stock, 13@15c; grease, 5@6c.

Cheese—American full cream, new: Twins, 10@10½c; Young Americas, 10½@11c; Daisies, 11@11½c; Longhorns, 11@11½c; low grades, 7@9c. Brick, new, fancy, 10@10½c; low grades, 7@9c; Limburger—New, fancy, 10@10½c; off goods, 6@8c Swiss—Drum, choice, 12@12½c; Drum No. 2, 10@11c; block, choice, 11@11½c; block, No. 2, 9@10c.

Eggs—Strictly fresh laid, loss off, cases returned, 27c; strictly fresh laid, at mark, cases returned, 24½@25c; storage, city, Apr. No. 1, 24c; storage, country, 21@22c; dirties and seconds, 20c; checks, 18c.

ST. LOUIS, Mo, Dec., 26—Butter—Extras, 24c; firsts, 21c; seconds, 19c.

Cheese—Young Americas, 11¼c; Twins, 11¼c; Daisies, 11c½; Longhorns 11¾c; Cheddars, 11c.

Eggs—Firm, 28c.

NEW ORLEANS, La., Dec. 23—Butter—Extras, 25@25½c; firsts, 23c; seconds, 19@20c. Ladles, 15@16c.

Cheese—Young Americas, 12c; Twins, 11½c; Daisies, 12c. Limburgers 21c per stone Domestic Swiss 14@16c.

Eggs—Fresh, 31c; storage, 27c.

TOPEKA, Kan., Dec. 26—Butter—Creamery butter, 23½@24½c; Dairy butter, 17½@18½c.

Cheese—Longhorns, 11¼c; Daisy, 10¾@11¼c; Prints, 12c.

NEWARK, N. J., Dec. 28—Butter—Steady; 23c.

Eggs—Firm; fresh extras, 37c.

PHILADELPHIA, Nov. 28—Butter—firmer; good demand; extra western creamery, 23½@24c; nearby prints, 27c.

Eggs—Firm and 2c higher; fresh near by, 34c; at the mark; do western, 34c.

Cheese—Quiet but steady; New York full cream, fancy, 11¾c.

BALTIMORE, Dec. 28—Butter—Receipts of desirable stock have been very light: but as is the case at this season, trade has been slow and uneven except the best grades of fancy creamery or fancy storage. The supply is not large in any line, but sufficient for the moderate demand. Market closes barely steady. Fancy Creamery, 24c; Imitation, 20c; Prints, 26@27c; Storage extras, 22c.

BOSTON, Mass., Dec. 28—Quotations: Butter—Creamery, western, extra, 23@23½c; western firsts, 21c; storage, 20@21c; dairy, 15@19c; western ladle, 14@15½c; box and print 16@25c.

Cheese—Choice, 12c; Wisconsin Twins, 11@11½c.

Eggs—Fancy nearby, 42c; western 25@30c; poor to fair, 25@28c; dirties, 20@23c; refrigerator, 24@29c.

LIVERPOOL, Dec. 28—Butter—Nominal.

Cheese quiet, American finest white, 51s; do colored, 53s, 6d.

BALTIMORE MARKET.

BALTIMORE, Dec 24.—Butter—It is generally the case during Christmas week that there is a lull in the demand for butter; hence, although the receipts of all desirable grades still continue light, they have so far this week proven fully equal to the wants of the trade, and we do not look for any improvement until the New Year's festivities are over; then we hope that the market will resume its normal conditions. Imitation creamery, when the quality is satisfactory, is in fair request. Ladles are in ample supply. Choice to fancy rolls have so far met ready sale. Packing stock is in moderate supply and demand. Blocks and prints are in light receipt; the demand is quite good for all choice to fancy invoices. The market in general closes quiet and barely steady.

Creamery separator, extras, 24c; firsts, 22@23c; seconds, 19@21c: Held creamery, extra, 22c; firsts, 20@21c; seconds, 17@19; imitation creamery, extras, 20c; firsts, 18@19c; seconds, 15@16c; Iowa & N. W. Ladle, extras 16½c.; firsts, 15@15½c; seconds, 13@14c; Roll, Ohio, extras, 16@17c; firsts, 15c; seconds, 13@14c: Creamery blocks (2lbs.) extras, 26@26½c; firsts, 25@25½c; seconds, 23@24c. Creamery prints, (½ lbs.), extra, 27c; firsts, 25@26c; seconds, 23@24c; Md, Va. & Penna prints, extras, 25@26c; firsts, 23@24c; seconds, 18@22c. Renovated butter, extras, 19c; firsts, 18c; seconds, 16@17c.

Eggs—Soon after our last issue, owing to very light receipts of all desirable stock of good, healthy demand, there was a sharp advance and the market was kept quite bare of all attractive offerings; but to-day with increased receipts and less active demand, there is an easier feeling prevailing and lower prices are looked for at any time, the market closes barely steady at 33 cents.

301 Exchange Place. G. M. LAMB & BROS.

SAN FRANCISCO MARKET.

SAN FRANCISCO, Dec. 24—Large supplies and a slow and cautious demand had a weakening influence upon the general butter market yesterday and an easy undertone was apparent in values for all lines. Really fancy creamery grades were freely offered in round lots at the 26c rate, only small parcels of the favored brands bringing the maximum quotation. Buyers, however, limited their orders to absolute requirements and the market closed with a heavy carry-over on hand. The market continued heavily burdened with cheap stock and was depressed, as holders were unable to force any outlet, although willing to accept almost any reasonable price. The easiness in the fresh lines has caused the demand for storage stock to cease, as the ruling rates for the former are comparatively lower than the values for held goods. The market for eggs was freely supplied and the top quotation for ranch was an outside price for the very finest whites. The demand was of moderate volume Cheese remained as previously quoted.

Receipts yesterday aggregated 42,000 pounds butter, 690 cases eggs and 4,000 pounds of cheese.

Butter—Creamery, extras, 26@27c; good to fancy, 23@25c; dairy, extras, 22@23c; dairy, choice, 19@21c; store, 18@19c; California storage, nominal; eastern creamery, nominal.

Eggs—Ranch, selected large, 40c; good to choice, 35@37½c; store, 30@32½c; California storage, 28@32½c; eastern, 25@30.

Cheese—California creamery, mild, new, extra, 14@15c; mild, new, choice, 13½@14c: Young America, 14@15½c; eastern, New York, Cream, Cheddars and Flats, new, 14½@16c.

ONLY REGULAR AWARD, CHICAGO, 1893—GRAND PRIZE, PARIS, 1900—ONLY GOLD MEDAL, BUFFALO, 1901

THE TREMENDOUS SALES OF DE LAVAL CREAM SEPARATORS IN 1903

Have eclipsed all former records, creamerymen and dairymen everywhere recognizing the fact that De Laval machines can be absolutely depended upon to secure certain and satisfactory results.

THE DE LAVAL STANDARD IS UNAPPROACHABLE

and as long as cream separators are made and used **De Laval Separators will maintain the highest position in the dairy world,** which position they have held with ease for more than 20 years.

READING NOTICES

All Reading Notices under this head are at the rate of 25 cents per line.

Position Wanted—In a butter or cheese factory by an experienced Danish dairyman. State wages. At the present time in Boston, Mass. Address S. P., care Hoard's Dairyman.

Wanted—One single, and one married man with two grown sons for dairy farm State wages expected. A. J. DAUGHERITY, Streator, Ill. 47-tf

Wanted—A position on farm or dairy. Experienced on farm and good milker. ALBERT VOOGT, 10240 Emerald Ave., Chicago, Ill.

Wanted—Practical dairyman, one who thoroughly understands feeds and feeding and can feed for profit. Must be single, sober, good milker, active, and willing to work. A good place for the right man. State wages wanted, experience and references. H. F. PROBERT, Jackson, Mich.

Milk Route—For Sale. Ill. At cost for cash. Rent 50-acre farm; chance for small creamery; modern machinery. Buy milk, four loads daily. Going west. Address BOX 535, Madison, Wis.

Do You Want—A Hay Fork Returner? Every farmer having a barn should have one. A hummer for agents. Circulars free. ROONEY RETURNER CO., Box D, Independence, Ia. 50-tf

For Sale—One Low-Down Milk Wagon; one De Laval Hand Separator; one Star Milk Cooler. All as good as new. Will exchange for registered Guernsey heifers or good work horses. J. R. HUSTON, Dayton, Ohio. 46-4

Guernsey Cattle—All ages, both sexes for sale. Cir. free. CLOVER KNOLL GUERNSEY HERD, Orangeville, Pa. M. Sager, Supt. 41-tf

For Sale or Rent—Dairy farm of 200 acres, 90 improved. $1.50 per hundred for milk year around. Address J. P. SOUTHARD, Harbor Springs, Mich. 42-10

For Sale—10 cheese factories, 5 farms 40 to 160 acres, saloon, dance hall and store. FRED HADLER, 775 Ida St., Appleton, Wis. 43-tf

For Sale—Cheese factory, complete. M. S. MORSE, Williamsfield, Ohio. 45-4

For Sale—Two registered yearling Guernsey bulls. RAY BICKNELL, Ft. Atkinson, Wis. 32-tf

O. Douglass has the cultures for butter and cheese making that take the prizes. They are the best yet produced. Send orders for free sample and instructions to O. DOUGLASS, 25 John St., Boston Mass. 45-sp

Feed Protegran—For economy and best results. Write the DEWEY BROS. CO., Blanchester, O. 44-tf

Buff Jersey's Third Revised Edition of the Dairyman Stock Breeder and Farmers' Hand Book; 10 chapters; The Buff Jersey Silo, how to build; Soil Crops; Dairy Cows, how to handle; Barns, how to build; Abortion, cure and preventative, and many other valuable things for progressive farmers. So popular has become the book that the author has concluded to make it an annual publication, and has put the price at a figure that makes it popular also. Postpaid, paper binding, 50c; cloth, 75c. BUFF JERSEY, Monmouth, Ill. 47-tf

Wanted—Position on southern dairy by practical up-to-date dairyman. Good milker, and understands care and feeding of stock; also making high-grade butter. K. F. du MAULIN, Chandler, Okla. 47-2

For Sale—Fine home and business. "Model cheese factory, 10-room house and barn, all new. Orchard and small fruit. This business will pay for itself in three years, besides a good living. Good reasons for selling. Price $3,500. One-half mile from R. R. station, grand roads past the house. J. B. CAMERON, R. F. D., Swanton, O.

For Rent—A 100-acre equipped, milk shipping (Holstein) dairy farm on shares. Big producers. Central Ohio. Address J. F., care Hoard's Dairyman. 47-2

For Sale—Guernsey bull, Salem's King, a fine animal 6 years old. A. PARKS, Picketts, Wis. 47-3

Half Rates to Portland, Oregon, and Return—Via the North-Western Line. Excursion tickets will be sold Jan. 6 to 9, inclusive, with very favorable return limits, on account of convention of National Live Stock Association. Apply to Agents Chicago & North-Western R'y.

Market Milk.

[Paper by R. A. PEARSON, Professor of Dairy Industry, Cornell University, N. Y. State Dairymen's Association, Ogdensburg, Dec. 9. 1903.

The rapid increase of the demand for market milk is shown in no better way than by the extension each year of milk transportation service into territory farther and farther from the cities. According to official statistics, 105 miles is the average length of the farthest hauls of milk into 34 of the largest cities of this country, and 6 of these cities receive milk from points distant 200 miles or more. New York City and Philadelphia are now drawing milk from points in the extreme northern and western part of this state and many miles beyond the most distant places from which their milk supply was received only a few years ago. The demand for market milk has become so great that butter factories and cheese factories have been crowded from districts where they have long been established, because the milk they would use is now turned to the cities. In this way the character of dairy work has been transformed over a considerable part of our state and so long as the cities continue to increase in number and size, we may expect the transformation of dairying to take place over a constantly enlarging territory. Certainly, we have not yet found the farthest point from which market milk can be shipped.

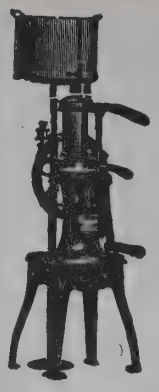
The production and handling of market milk is a very important industry in New York State, and its importance is increasing daily. It is stated on good authority that one-third of all the cows in the country are producing milk to be consumed in its natural form. We may add that in no state is this branch of dairying of greater importance than our own.

There are many unsolved problems in connection with this growing industry. Some of them are being worked out slowly by practical experience, and by careful, scientific experiments and observations. Others are still mysteries that we recognize but cannot understand. They all have to do with the great question, how to economically produce and market milk, and the question is not materially different whether the milk be for the market or the factory.

Milk must be produced before it is marketed, so we will first briefly consider this branch of the business. It goes without saying that we want to produce good milk. Those who are indifferent upon this point fail to appreciate the great responsibility of their work and need to have it impressed upon them that milk is our most delicate food product and, unlike most other foods, it is almost always used raw. Gross carelessness, ignorance or neglect on the part of the dairyman may endanger human lives. The production of a uniformly good milk results in an immediate advantage to the individual producer and to dairymen as a class, because every gallon of good milk tends to enlarge the market, while every gallon of poor milk or bad milk tends to lessen the market. The dairyman who establishes a reputation for the high quality of milk he produces will seldom lack for a profitable outlet. Sometimes it seems to be hard to get a fair price for high grade milk, but so many are doing it that the possibility is plainly shown.

In the main, the old doctrines regarding the production of wholesome milk remain true. Cleanliness continues to be the great need. Its neglect is the chief drawback of dairying in too many places. Neither the scientist nor the inventor has been able to suggest any measure to replace cleanliness in dairy work. It may come, but it has not yet. Aeration, straining, filtering, clarifying and pasteurizing are only ways of partially reducing the effects of contamination that should not have occurred, and the benefits of some of these forms of treatment are vastly overestimated. The fact is, that good, reliable milk cannot be produced in a dairy where cleanliness does not rule.

Bacteria and dirt are close friends. Wherever dirt goes bacteria go, and the moment they get into warm milk, their objectionable work begins. The more dirt the more bacteria and the worse the contamination. Fraser has shown that from 22 to 90 times as much dirt falls into the milking pail from a soiled udder as from a cleaned udder, and Stocking has shown that by the use of a partially covered milk pail about two-thirds of the dirt that would fall into the milk during milking, is excluded. The special milking pail devised by Dr. Freeman, of New York, is probably the best for this purpose.



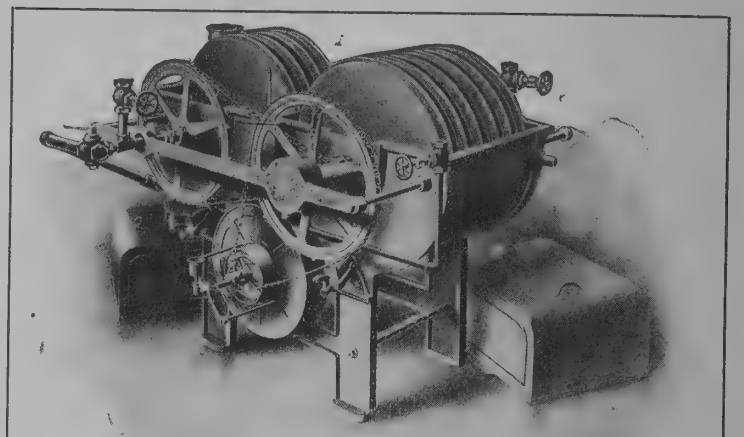
By following cleanly methods, the number of bacteria finding their way into milk can be reduced from millions to a few thousand, and by promptly cooling the milk and holding it at a temperature below 50 deg. F. they will be prevented from rapidly increasing. The idea that milk need not be cooled promptly because of its so-called bactericidal action seems to be shown by recent investigations to be incorrect. As to the proper temperature to which milk should be cooled, Conn has shown that the number of bacteria in milk held at 50 deg. F., will increase only five times in 24 hours, while at 70 deg. F., they will increase 750 times. The need of having cows and persons who handle the milk, in good health, is obvious.

The whole secret of producing good milk can be generalized in a few words: Healthy, clean and well-fed cows having a clean, comfortable stable; healthy, clean and quiet milkers having a disposition to treat the cows at least fairly; sound, clean and sterilized utensils; prompt cooling and protection of the milk. This is the secret that is bringing success to some dairymen while their neighbors fail. These conditions could be introduced easily, cheaply and profitably into thousands of dairies. Too many dairymen make the mistake of thinking that a large outlay of money is necessary before high grade milk can be produced. They are scared off by a phantom. The fact is, many dairies could be changed to a sanitary from an unsanitary condition without the expenditure of a single dollar in cash. More light, more fresh air, better arrangements for bringing the feed and for removing manure, a little time each day to clean the stable and the cows, a coat of fresh whitewash once or twice a year to cover and kill the bacteria on the walls and partitions—these things are not expensive—and perhaps a new ceiling or floor above the cows to exclude dust from the hay mow.

It should be remembered that unsanitary conditions in a dairy produce heavy losses. Many head of stock and many thousand gallons of milk are lost or injured annually on this account. This is shown by scientific experiments, as well as by common observation. Sanitary measures tend to prevent such losses, and they should, therefore, be looked upon as a cheap form of insurance. Some dairymen are running greater risk of loss due to unsanitary conditions than loss by fire, and the improvement of their dairies and methods of dairy work would be a cheaper form of protection against loss than the purchase of a fire insurance policy. There is then a distinct advantage in dollars and cents in the operation of a dairy in a sanitary manner.

The one who produces market milk, must ever be on guard to avoid all conditions that may make his milk unmarketable. These include flavors or taints that may be caused by feeds. In this respect much is said against ensilage, but I am convinced by experience that good ensilage, properly used, will produce good milk. I have seen cases where milk was seriously affected by the use of spoiled ensilage, and I believe such are responsible for the bad name given to ensilage in some quarters. Feeds that would taint the milk should be avoided, but to a limited extent may be used without injury if fed immediately after milking. Care should be taken to use only wholesome feeds and these in proper proportions.

In one respect the marketing of milk is a simple matter and this is in the fact that practically all consumers can be satisfied by one standard. Few people will complain of clean, wholesome milk containing about four per cent fat. In other respects this branch of the market milk business is one of great difficulties.



THE
Iowa Dairy Separator.
AN UP-TO-DATE MACHINE
REPLETE WITH PRACTICAL IDEAS
It is built in the following sizes:
250, 350, 450, 600, 750 POUNDS PER HOUR
Our 750 pound per hour machine is a practical Hand Separator. It is as easily run as most separators of 450 pounds and 500 pounds capacity.

Milk is such a delicate product and so susceptible to unfavorable conditions that it must be handled with extreme care and despatch.

Sometimes dairymen are too anxious to ship their milk and they send it to the retail market when it would give them better return if disposed of in another way. This results in their own loss as well as depressing the milk market. They should remember that they can take a lower price from a creamery than from a shipping station, and one of the chief reasons is that they may retain the skimmed milk which is valued by many authorities at from one-half to one cent per quart, as a feed for young stock. If it cannot be used for this purpose it has some value as a fertilizer. Furthermore the same extreme care does not have to be exercised to prevent the growth of lactic acid bacteria in milk for the butter or cheese factory as in milk for the market. Then too, the dairyman may be attracted by a temporary high price offered for market milk and he commences to ship, only to find that in a short time the price is reduced to an unprofitable point. Unless milk shipping is firmly established in a locality, it is a serious mistake to close up every other outlet for the milk. But where the business is well established and well conducted it is generally more profitable to the dairyman than any other of the usual ways of disposing of milk.

Milk for the market should be bought from the producers on a basis of its fat content and its sanitary condition; its value as a salable product depends upon these two things. Everyone knows that 4 per cent milk is worth more than 3 per cent to the dealer, and milk that has been carefully handled is worth more than that which has not. Why should not these two desirable factors be paid for at a fair rate? Almost every argument in favor of paying for milk delivered to a factory, on a fat basis, applies with equal force to market milk and there are just as strong arguments in favor of having the value governed also by the sanitary condition. The Babcock test shows the fat content quickly and accurately. An occasional examination of the producing premises supplemented by tasting and smelling the milk when delivered and the simple acid test or the fermentation test, clearly shows the sanitary condition of the milk. A few milk buyers are now purchasing milk on the basis of its fat content and, roughly we may say, its sanitary condition. It is to the dairymen's own interest to have this practice extended.

A western creamery has built up a very large and successful business of making butter from hand separator cream which is shipped from all directions and from some points 500 miles distant. They pay two cents more per pound for butter fat that comes in good condition than for that which comes in bad condition. They make high-class, prize-winning butter. The dairy industry is rapidly developing in their section, showing that their methods are wise. The president of that company told me recently that most patrons deliver the higher price cream, or soon patronize another creamery where there is no discrimination between good and bad. If a creamery finds it profitable to differentiate between good and poor cream at the rate of 6 to 10 cents per hundred pounds of milk, the buyer of market milk would find it profitable also to adopt such a plan.

Dairymen as a class should make greater efforts to build up and protect the good reputation of their products. Steps should be taken to counteract the bad effects of articles occasionally published in the press which serve to condemn all milk, and sometimes in the strongest terms. In an editorial in one of the great city newspapers this sentence recently appeared: "If there is one statement on which the whole medical fraternity of all kinds is agreed, it is that untreated milk is a source of disease at all times." Such a claim is idiotic and it will fall of its own weight. It need not be noticed. But if newspaper condemnation is based even remotely on definite facts then it is to the interest of all dairymen to see that the objectionable conditions are improved so there will be no grounds for a repetition of the complaint.

Each member of this Association should constitute himself a committee of one to do what he can toward lessening the abuses to which the dairy interests are sometimes subjected. When our Secretary wrote his strong letter to a leading dairy paper a few months ago calling attention to the condition of many of the milk cans returned to shippers by city dealers, he rendered a service to the dairymen that is appreciated less than it deserves. That letter, parts of it, or statements commenting upon it, was largely read. It told of the filthy, sometimes indescribable condition in which empty milk cans may arrive at their shipping points from the city and placed the responsibility pretty nearly where it belongs.

It is not putting it too strongly to say such cans are a menace to the public health. Some measures should be taken to require that all cans be cleaned before they are put onto the returning trains and protected while in transit. It would be within reason to go farther and require that they be sterilized always previous to being filled with fresh milk. It seems to me this would be a proper subject for this Association to take up through the appropriate committee. It might render great service to many dairymen of the state as well as to milk consumers by investigating the matter and proposing suitable remedies. A well-conducted effort of this kind would serve to promote "the dairy interests of the state" which is one of the purposes of our organization as given in the act of incorporation.

I believe that we are entering upon an era that will see great improvement in the market milk business. The public is being slowly educated and a discriminating demand is becoming evident. To partly supply this demand a large number of very high class dairies have been established within the last few years and their products are being retailed at prices from 10 to 18 cents per quart. It may be answered that some of these have failed, but from my personal knowledge of a number of them I am satisfied that the failures are more often due to lack of good business management than any other cause.

One of the chief causes for the noticeable change in public opinion is the intelligent interest in the milk supply which is shown by some physicians. We know that many physicians are very ignorant and some are very unreasonable when it comes to dairy questions, but some are well posted upon practical dairying as well as the theory, and they are leavening the entire profession. It is especially worthy of note that medical students are now receiving more instruction on milk than formerly. Milk commissions have been organized by physicians in some cities to encourage the production of high grade milk. They endorse the product of dairies that are conducted in the careful manner prescribed by the commission, and their endorsement assists in developing trade. A step toward better milk is again shown by the fact that in one of our large cities arrangements are now being made toward the purchase of all milk for public institutions under a contract that will require certain sanitary conditions as well as a minimum fat content. Heretofore, the only requirement has been that the milk should contain the legal amount of fat and not be sour.

Most decidedly there is a small, but growing, demand for better market milk and at a fair price. It is to the interest of every dairyman to look well to his own work and see that it is being conducted in the best possible manner. Sanitary principles must be observed, where pure milk is produced or handled, and the time is past for discounting the common sense idea of introducing ordinary cleanly methods into places where our most delicate and most important food is produced and handled.

The DAIRYMAN congratulates Mr. Robt. H. Pethebridge, City Milk Inspector, of St. Louis, on winning the Gold Medal in the butter making contest at the late Missouri Dairymen's Convention at Clinton, Mo. This fact gives evidence that Mr. Pethebridge is the right man in the right place in the important work of inspecting city milk.

ELECTRIC Metal Wheels

will give you a new wagon and a lifetime's service out of your old running gears. They are the modern great service wheel. Made to fit any wagon, adapted to every duty. Straight or staggered oval steel spokes, broad tired, any height desired. You will be through with repairs and save money, fields and labor of horse and man. Write at once for our catalogue. ELECTRIC WHEEL CO.,
BOX 130 Quincy, Illinois.

Count the Potatoes and Win a Farm.

Only large black spots supposed to be potatoes. No small specks on cornucopias or illustration to be counted

$4,300 PRIZES GIVEN AWAY

Every Correct Count Wins a Prize.

To those counting the correct or nearest correct number of potatoes in the above puzzle the following prizes will be given; CASH VALUE.

Prize for 1st Correct or Nearest Correct Count, a 40-Acre Farm	***$200.00***
Prize for 2d Correct or Nearest Correct Count, a 40-Acre Farm,	***200.00***
Prize for 3d Correct or Nearest Correct Count, a 40-Acre Farm,	***200.00***
Prize for 4th Correct or Nearest Correct Count, a Beautiful Upright Piano,	***300.00***
Prize for MOST COUNTS Received During Contest from one Person, 40 Acres of Land	***200.00***
Time Cash Prize (estimated)	***200.00***
Pocket Fountain Pen Prizes (estimated value) Distributed	***2000.00***
Map of the World Prizes (estimated value) Distributed	***1000.00***
GRAND TOTAL	***$4300.00***

TIME PRIZE To the person sending the largest number of counts before March 1st, we will give $1.00 a day from the time the first count is received until March 1st, 1904. For example, if you send in the largest number of counts and your first count is received 10 days before March 1st, you will receive 10.00; if first count is received 100 days before March 1st you will receive $100.00, so you see it will cost you $1.00 a day for every day you delay.

MOST COUNTS To the person sending in the largest number of counts during the entire length of contest we will send a deed to 40 acres of land, as described here in, free and clear of all encumbrances.

EXTRA PRIZE Every person sending 50 cents for a year's subscription to the MAIL ORDER MONTHLY MAGAZINE and one count, will receive a beautiful three color Lithographed Map of the World—one of the latest made, instructive and useful. No home should be without it.

ADDITIONAL PRIZE Every person sending in $1.00 for a two year's subscription to the MAIL ORDER MONTHLY MAGAZINE and THREE COUNTS at one time will receive a "Merchants" Pocket Fountain Pen, hard rubber holder, 14 karat rolled gold plated pen point, an article useful to everyone. IT PAYS TO SEND THREE COUNTS. With three counts you can send one number on each side of the number you have counted and the chances are one of the three will win.

REMEMBER THE MAIL ORDER MONTHLY MAGAZINE is a family magazine, illustrated. It has a Woman's Page and Farmer's Page, a Fashion Page, and lot of good things for the whole family including the Children, and is well worth the money. Send in your subscription and count at once. The farms we give as prizes are located in the heart of the potato and dairy district in Polk Co. Wisconsin, and will greatly increase in value as the soil is rich and fertile and this section is being well settled.

The piano is an upright, beautifully finished, in mahogany case, fully guaranteed by the manufacturer. Should there be a tie of two or more sending the correct count, the value of the prizes will be equally divided. The Mail Order Monthly Pub. Co. will pay the cash to winners if desired in place of any prize offered. In our former contest the following successful contestants each received a 40 acre farm in Wisconsin: Ole S. Jordet, Box 25, Sacred Heart, Minn.; H. J Tourelle, Winnipeg, Minn.; Geo. E Dean, 2805 Harriet Ave., Minneapolis, Minn.; Martin Larson, Merrill, Wis.

No one connected with our publication will be allowed to compete Contest will close May 31, 1904. Be sure your count reaches us early. The judges are some of the best well known professional and business men in the city

JUDGES: J. W. Jenkins, Pres. Red River Valley Land & Loan Co., St. Paul, Minn., capital $150,000.00; J. C. Jenson, Ex-Cashier State Bank of St. Paul, capital $100,000; Judge J. R. Blackburn, St. Paul, Minn., a member of the executive council of the Union Veteran's Union.

1 year's subscription, 1 count, and map of the world.....50 cts.
2 year's subscription, 3 counts, and pocket gold fountain pen.....$1.00
Each additional count, without subscription.....25 cts.
25 counts, without subscription.....$5.00
The receipt of magazine will be our acknowledgement of your subscription.

BE SURE TO RETURN THIS COUPON.

BRANCHES: Kansas City, Mo., Minneapolis, Minn.; Waterloo, Iowa; Omaha, Neb, St. Louis, Mo. and Cowansville, Quebec.

Note and Comment.

Siloing Shredded Corn —Plea for the Silo.—Siloing Clover and Mixed Grasses —Feeding and Health—Dairying in Indiana.—Dairying and Education.

ED. HOARD'S DAIRYMAN:—The December 18th No. of the DAIRYMAN, is one of much interest and can be read with profit by dairymen generally, though some are away and beyond it in their own ways and practices and as Uncle Theodore puts it, "know it all, and have nothing to forget." While I had supposed the DAIRYMAN to pretty nearly cover the entire field of dairying, I found a man recently who had stopped taking it because "he was taking his milk to a cheese factory and the DAIRYMAN had no factory department." If he were taking the paper now and had read J. A. M's. criticism of Prof. Farrington, in the last number, he would have gotten a lot of information in the "factory department" that would have confirmed him in his belief that educated cheese makers and scientific apparatus were only other ways of "defrauding farmers without detection." Whatever one may think in the matter they cannot help but admire the dash and vim of J. A. M.'s foray upon the Madison citadel, and anxiously await the explosion of Maximite that is pretty sure to follow.

Dr. A. T. Neal, of Delaware, is usually especially well informed in all of his utterances, and the synopsis of his address on page 1011 is very interesting and his figures about that 50 acre cornfield will attract attention from more than Note and Comment. It would at first seem that his 36 bushels to the acre, would be pretty low in yield; and that 20 pounds of cut stover would be too little daily roughage for a winter milch cow, and it would need considerable corn meal and good hay, in addition, to secure as much more needed starch. In certain sections, crimson clover and alfalfa are not as yet to the "manor born," and when it comes to putting that stover into the silo shredded, and wet down ton for ton with water, I think that the northern dairymen will say, let us fill the silo with the maturing corn, filled with its own natural juices, and excuse us from handling a ton of water with each ton of stover.

I am not so sure this wetting down stover in the silo will prove a great success every time. I have never tried it, but my near neighbor recently filled his silo with shredded fodder, and put on 8,000 pounds of water to dampen it, and it is moulding, fire fanging, and is rapidly becoming worthless as feed in spite of his precautions; and what its condition is, deep down in the silo, remains to be seen.

While we have great faith in Dr. Neal's judgment for Delaware, we have doubts about crimson clover, cow peas and the like in the north to go with shredded stover. It looks that if 18 acres of the 50 had been put into silage corn, and made into silage when mature, ears and all, the dairyman would make a distinct gain over the 50 acres of stover and its equal weight of added water, and the dairy of 30 cows would give more milk, and let the other 32 acres of field corn supply the balance of the stock, etc.

Dr. Watson's plea for the silo, on the same page, is a just tribute to the farmer, and the doctor might have added that in the evolution and revolution of the silo, the farmers have led the way all the time in the matter, and the scientists have been following along and explaining things, and for this all praise is due. The Editor of this paper can well remember when Prof. Henry of Wisconsin, was about the only agricultural college man in the country who dared to stand up and say silo, out loud, but the farmer held on, and now he has every scientific institution at his back, aiding him. While giving the scientific man full and deserved credit which is rightfully his, we still hold it has been the farmer who in a practical and yet often blind way has led in the matter of silage, and to him is due, in the larger degree, the discovery, and "made the best use of and in the most economical way, of America's best and most abundant food plant."

I note what A. D. Baker says about putting clover and mixed grasses into the silo, and found that the wetter it was with rain or dew, the better it kept. Several years ago I was at Bushrod Conant's when he was filling his silo with clover. It was quite a rainy day and he was rushing matters, the clover coming direct from the cutter bar of the mower, and both the clover and the men were dripping, but he said very wet clover would not overheat in the silo, so he either cut and filled rainy days or wet down the mass, and he had fine silage as a result, and while he did not know that clover took on a greater heat in siloing because of its extra amount of proteins, he had discovered that water in addition would prevent and make up for what would be otherwise a greater evaporation of moisture as compared with corn silage, a matter now made known in books. Out in Washington they silo the alfalfa in the rainy season when it would be next to impossible to cure it, and I think Adam Stevens of Ellensburg could give the DAIRYMAN a most interesting article on that subject if he would kindly consent.

The editorial on page 1014 about "Putting this and that together," is worth reading twice, and very slowly so as to get its purpose, and absorb it fully, and if read conjointly with the "Feeding standards" a dairyman will be put on the track of securing some excellent thinking matter and practical information to put into his dairy business. I once heard Dr. Smead say that if the farm animals were fed well and intelligently, that he would loose two-thirds of his practice at once, a frank admission to say the least, and he might have added that it was because of this ill prompted feeding that so many try to conceal their ignorance by buying so much lauded "stock foods" at $300 a ton, and making their solemn "Afferdavids" that three feeds a day for a cent, had driven all bad luck away from their farms, doubled the flow of milk, and the like, and they did not have to bother to learn it out of a book, to do it, either.

I think the word "comfortable" stable

MILK DEALERS COMBINATION Milk Protector, for cans or bottles. Prevents milk churning and souring in summer and freezing in winter. INVESTIGATE. S. C. Sullivan Mfg. Co., Erie, Pa.

PURE BRED SHORTHORNS
CHOICE BULLS FOR SALE.

Richest Cow of all breeds in Pan-American Model Dairy. Winning Herd at Ohio and New York State Fairs, 1903. W. H. FORBES & CO., Yellow Springs R. R. No. 1, Ohio.

But Two Bulls Remain
That are old enough for service. One combines the blood of Stoke Pogis 5th, "Exile", "Ida's Rioter", Mary Anne", "Naiad", "Crocus", Allie", and Mollie Garfield", and the other four crosses of "Eurotas", through three of her sons, with some of the best St. Lambert blood.
To induce immediate sale these are priced far below their worth. If in need it is for your interest to write for pedigrees, and to do it TODAY. Ask for Sale List A20.
WINTERGREEN HILL FARM
SCOTTSVILLE, N. Y.

VALLEY FARM Offers five Yearling Heifers sired by "Diploma's Victor 56310" and safe in calf to a grandson of "Golden Lad." Also 1 yr. bull. The 6 head in a young herd cheap to make room for Winter. Write for particulars to
FRED STUBLEY, Black Earth, Wis.

ESTATE W. S. LADD, Portland, Oregon.

JERSEY BULLS Now or soon to be ready for service; also several well bred HEIFERS. Let us send you prices and breeding, with milk and butter records. All stock is registered or eligible. E. E. STEVENS,
North Madison, Ohio

FOR SALE Son of Pedro's Pretty Pogis, 39660, A. J. C. C., a superb son of old Pedro, both of World's Fair fame. Two yearlings from tested dams. Some royally bred Poland China Pigs, March and April farrow.
J. Q. EMERY & SON, Albion, Wis

comes pretty near covering the whole subject when its definition is fully comprehended and carried out. It seems as if some men tried to see how uncomfortable they can make a stable, and these are the strenuous advocates for exercise for cows and much northwest air. It costs so little to have ventilation, suitable foods, and regular care and attention for the stock, it would seem that the subject matter of the editorial in question would be quickly adopted everywhere, by the cow owners at least.

There are a lot of men who can give President Roosevelt pointers in the Panama business, and are authority on treaties and international affairs, who are unable to feed, or care for a cow intelligently, let alone profit, and while they are wise in matters of state, they decry the need, or necessity of special knowledge or investigation as applied to their farm business, and stoutly maintain that luck and experience are the only ways by which success is attained, and still are asserting all the time that farming does not pay, and no feller in the editor's office can tell them anything about farming.

Uncle Perry Goodrich, going down into Marshall Co., Indiana, taking a cow census and rubbing it in at their dairy meeting, was a good deal like carrying war into an enemy's country, for Indiana is not greatly enamoured of the dairy, and a fat steer comes nearer filling their eye, than does a Jersey cow, albeit there are scores of fine dairymen in the state. I know of no one better equipped than Uncle Perry to stand up and preach the gospel of the true dairy cow, and I am sure his talks there will be of lasting benefit. Nor do I wonder that many who came, "were astonished" at his doctrine, as he set out the contrasts between intelligent and careless dairying, judging them from their own confessions.

Still I do not suppose he found them sinners above all in Jerusalem, for careless work is something that is quite prevalent everywhere, and I dare say that some of his listeners, at the conclusion of this investigation, were in accord with the opinion of the Confederate general in war time, when Uncle Perry was spying, and let him off because he thought him lacking in intellect. I wonder if Uncle Perry had not better tell that war experience in the DAIRYMAN, as one of his investigations that had no connection with dairying.

***

It was a great innovation to bring rural school matters into a dairy convention, as they did in Maine, but I know of no one better qualified to present it, than my old friend, Prof. J. W. Sanborn, and I congratulate him over his presentation of the centralized plan of one, large, graded school in a town, with the rank and the equal of the city schools, and still retaining its home and rural influence. We have referred to this before in the DAIRYMAN, and may again, as it is a practical solution of the question of how shall the mass of country children get the education to which they are entitled, and, as at present, only about three in twenty get.

Our own township is a signal example of the efficient and progressive work of this centralized plan, and the attainments of the scholars, as compared with the district plan, are wonderful. While I cannot say that it solves completely the question of why the boy leaves the farm, it does economically and satisfactorily solve the question of rural education, and is being recognized and adopted in the dairy sections of our state in a four to one ratio, as compared with other sections, and this is why we make a dairy item of it. Good reason, is it not?

Ohio. JOHN GOULD.

Trouble from Feeding Sorghum Silage.

ED. HOARD'S DAIRYMAN: — In the DAIRYMAN of Dec. 18th, there is an article on sorghum and corn silage signed by G. B. T., Ocala, Fla.

The symptoms he noticed correspond exactly with those of sorghum poisoning.

I have frequently seen cattle poisoned from eating young sorghum, while at other times it does not seem to hurt them.

I have never had any experience with sorghum in silo but never knew thrifty, well matured sorghum to hurt cattle.

I do not know of any help for the situation, for a few mouthsfull seem to be as fatal as larger quantities.

Pasadena, Calif. W. W. COKE.

India, a Government Dairy Operated By Black Convicts.

A Doctor as Dairy Manager—the Customers—Dishonest Officials.

(By George Cecil, London.)

To the stay at home reader who has not penetrated the mysteries of the East the above heading will, perhaps, read as though it were a page from "A thousand and one Nights" or from a book of fairy tales. But the patron of this journal who is under the impression that he is about to be elaborately hoaxed need have no such fears, for though it is admitted that "India, a Government Dairy Operated by Black Convicts" sounds unlikely, the fact nevertheless remains that at Bareilly (an important Civil and Military "station" in the North West provinces of India) a portion of the gaol has been converted into a Government Dairy, the dairymen being drawn from amongst the convicts.

The virtual head of this peculiar dairy is the gaol superintendent, a doctor in the employ of the Government, whose duties consist in looking after the health of the prisoners, awarding them corporal punishment—and seeing that the sentences are duly carried out, keeping an eye to all returns and forms, and, in a word, being responsible for the welfare of the establishment.

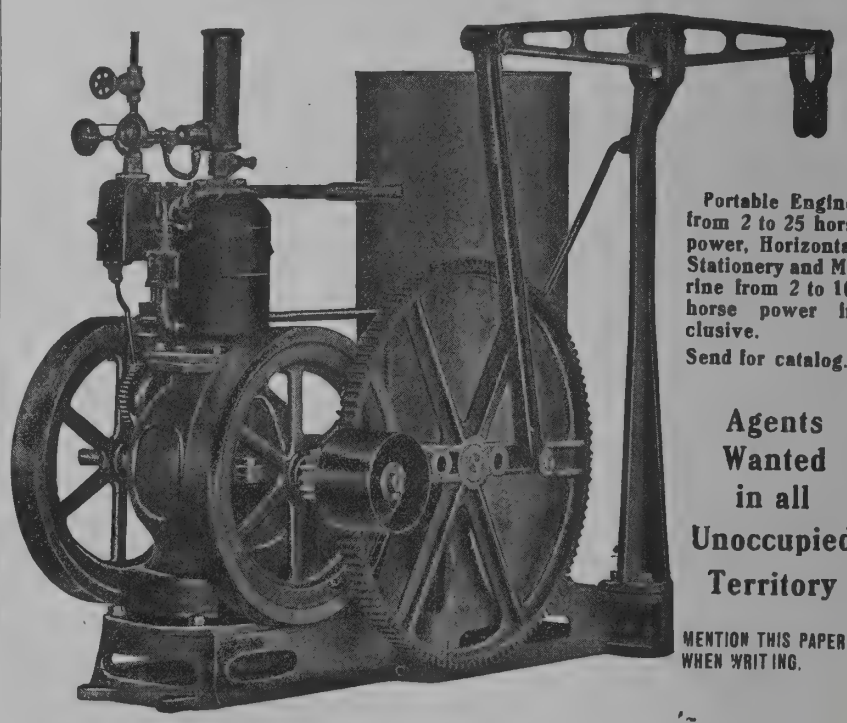
It will, under these circumstances, be wondered why a doctor in charge of a gaol must necessarily be a glorified dairy manager. As a matter of fact it does not follow that the doctor in question is any more fit to "run" (in India everything is "run"—from one of Lord Curzon's levees to a regimental cricket-match) the Bareilly Gaol Government Dairy than a fully qualified bootblack is fit to undertake the duties as President. This, however does not deter the powers-that-be from entrusting the medico with the onerous duties in question, it being the policy of Anglo-Indian rulers to make appointments upon principles which are for the most part devoid of common sense. It will perhaps be asked how, under the circumstances, the dairy in question exists. The awswer is that the European understrapper who acts as head gaoler includes amongst his duties looking after the dairy and that, having plenty of leisure, he has no difficulty in mastering every detail of the work. He may thus be described as a qualified dairy manager.

A word as to the activity displayed by the dairy which forms the subject of this article, and which is (so far as the writer is aware) unique—there being no other establishment of this nature in any part of the world. The butter, cream and milk which forms the output of the dairy is advertised in various Anglo-Indian papers, with a view to securing orders from all parts of India. A goodly proportion of such orders arrive every day and are duly executed by the head gaoler; amongst the customers being corpulent "Commissariat" captains who, by dint of accepting secret commissions and bribes, are able to afford luxuries which they would otherwise have to do without; well-to-do "Commissioners"—who are suspected of augmenting their strictly legitimate pay by receiving gratuities for recommending Rajahs and other undeserving Eastern potentates for decorations and recognition at the hands of the Government Indian Staff Corps; Colonels—who prefer to cultivate the size of their waists to improving their minds; and wealthy Calcutta merchants—who believe in the pleasures of the table; and various other representatives of the Anglo-Indian population.

Orders are also received from rich natives, who, on the strength of having passed a few years in England, have imbibed a taste for fresh butter and cream. A fair trade is also done with the English residents of Barielly, much to the disgust of the local "Dudh-Wallahs"—who, with a view to gaining custom for themselves, spread scandalous reports about the so-called impurity of the milk and butter vended at the gaol dairy. They also endeavor to secure custom by drawing attention to the fact that their prices arh far lower than are the rates charged by their competitor. It may be added that their importunities carry little weight wite the white population of Bareilly, since these people know better than to risk their health by purchasing inferior stores, though the half caste element are only too glad to purchase in the cheapest market, preferring to buy typhoid fever infected meat than to pay a higher rate for stores, the excellence of which cannot be questioned.

Although the post of dairy manager does not carry with it a large increase of salary, both the civil surgeon and the Head Gaoler are only too glad to be allowed to have the care of the dairy thrust upon them, for the position carries with it certain perquisites. For instance, when entertaining his friends there is nothing to prevent the Head Gaoler from offering them rich milk and thick cream from the gaol dairy, whilst should he think that they will prefer the gaol dairy butter to that which they are accustomed to in their own homes, it is highly probable he will press upon them pat after pat. In the same way, when entertaining the Lieutenant-Governor at luncheon, it is highly probable that "His Honour" will be generously helped to the produce of the gaol dairy.

Of course it is quite possible that both the Goal Superintendent and the Head Gaoler will debit themselves with the cost of such articles; it is also probable



DON'T BUY GASOLINE ENGINES UNTIL YOU HAVE INVESTIGATED **"THE MASTER WORKMAN"**

A two-cylinder gasoline engine; superior to all one-cylinder engines. Costs less to buy and less to run. Quicker and easier started. Has a wider sphere of usefulness. Made in Three Sizes.

that they will do no such thing. And when it is borne in mind that in a hot country like India, butter, cream and milk are liable to go bad at a moment's notice, it will readily be understood that the Head Gaoler will find it an easy matter to account for delicacies consumed by himself and his friends as forming part of that which has become unfit for human consumption. And should he desire to stand well with his official superior, the Gaol Superintendent, nothing is easier than for him to adopt the same principle when supplying that worthy.

It may, in conclusion, be pointed out that although the appliances used in the Bareilly Gaol Government dairy are of a more or less primitive nature, they are scrupulously clean—a thing which cannot be said for those utensils used in the ordinary native dairy. And when it is borne in mind that in addition to observing sanitary precautions of a high order, the goods are of first-rate quality, it will readily be understood that all who value their health, make a point of dealing with this remarkable institution.

London, England.

Handling Liquid Manure.

ED. HOARD'S DAIRYMAN:—Referring to the letter of D. M. A., on page 1007 of December DAIRYMAN, would say that I have had a similar need, and not finding anything in the shape of liquid manure hauler and sprinkler on the market within reasonable prices, I invented one and had it made according to drawings and find it to be both successful and cheap, and will advertise as soon as arrangements for manufacture are completed. If D. M. A. will write me, I will put him in the way of getting one immediately.

I have long been convinced that handling manure in the liquid form is the true solution of the manure problem, at least for cow stables, and have planned my stable now being constructed, for the installment of the liquid manure system. A short description may be helpful to D. M. A. and others.

I use a cement gutter back of my four and a half foot stall platform. This gutter is semi-circular in cross section with a ten inch radius, with the upper edges rounded off to an inch radius to prevent chipping. It is level from end to end. Sometimes a cow will stand back in this gutter, but not often, and on the whole no oftener than is the case with sloping-bottom gutters, and much less than where a flat-bottom gutter is used. At the end of this gutter I place an air-tight sluice gate that can be opened and connect the gutter with the cistern or a closed drain leading to it. No strainers or sieves should be used here, but the straining takes place later in the process.

A wooden swab is now made that will fit a section of the gutter, the last three-fourths of an inch being leather or rubber belting to be slightly pliable and yet closely fit the gutter. A long handle for pushing is fitted to the swab. The cow usually voids enough of urine to carry off the excrement and the cut bedding that has fallen back from the stall, at least over the smooth surface of a cement drain with no cracks and corners. A little water can be added however to advantage if an ample cistern has been provided. Now open the sluice gate and go to the other end with the swab, and with a slow, steady push the whole mass runs down into the cistern, leaving a gutter that only needs a little flushing or scrubbing to be clean enough to lie down in.

Having the manure in the cistern where it can all rot thoroughly and rapidly, the strainers and separators can be used between that and the faucet or outlet, so that ordinarily only the liquid manure is drawn away. A larger opening should be left in the cistern however so that the solid matter that remains after draining can be easily removed. To this end the cistern should be double, so that one-half can be filling while the other half is being emptied—at least where the soiling system is used.

It is well also, though not essential, to have the cistern on a hillside where a roadway can be made below it, and the manure sprinkler filled by simply opening a faucet or valve—as locomotives are filled from elevated tanks.

This system has several advantages:

1. The semi-circular gutter is the most sanitary. The gutter is the dirtiest and most dangerous place in the stable, and so ought to be the most cleanable instead of the hardest to clean.

2. The never-ending, dreaded, back-breaking task of lifting up the filthy mass by nasty shovelfuls, fouling one's clothes and polluting the air of the stable, is in great part eliminated and dairying made easier. Not a pound has to be lifted. Gravity does it all from beginning to end.

3. Much time is saved. A few minutes daily suffice to clean the stable.

4. Last, but not least, not an ounce of fertilizer is lost—everything is saved.

The plan you recommend to D. M A., on page 1007, will not work very satisfactorily. The strainers will soon clog, even though put in double as recommended. But the principal objection will be that where many cows are standing in line, the excrement from each is liable to stop up the current in the gutter and you will have a succession of little dams, and but a small portion of the urine will drain off without work each time. Any slope you may give the gutter will help but slightly. A subsidiary drain, connecting with the gutter behind each cow, would remedy this evil, but only by introducing a worse one—a microbe refuge. False bottoms, removable bottoms, etc., in a drain are a "delusion and a snare." Better put your extra money and work into a big double cistern, and enjoy dairy farming ever after.

E. M. H.

Centreview, Mo.

Ayrshire Breeders' Assoctation.

The 29th Annual Meeting of the Ayrshire Breeders' Association was held December 2d in the parlor of Stanwix Hall, Albany, with twenty-five members present and some ten visitors.

The report of the Secretary showed nineteen new members added during the past year, and seven lost by death.

The report of the Treasurer showed a balance of $5,469.

It was voted to continue the Home Dairy Test for the next year.

It was voted to appropriate $1,000 in aid of approved exhibits at the World's Fair at St. Louis in 1904, and a committee was elected to look after the selection of animals for the show. C. M. Winslow, Brandon, Vt., Charles C. Doe, South Newbury, Vt., and Geo. E. Pike, Gouverneur, N. Y.

The scale of points was revised to give a more decided dairy conformation to the Ayrshire cow.

The following officers were elected:

President, Dr. Thomas Turnbull, Jr., Casanova, Vt.

Vice-Presidents, Obediah Brown, Providence, R. I., Charles C. Doe, South Newbury, Vt., E. J. Fletcher, South Lyndeboro, N. H., S. M. Wells, Newington, Conn.

Secretary and Editor, Charles M. Winslow, Brandon, Vt.

Treasurer, N. S. Winsor, Greenville, R. I.

Executive Committee in place of J. O. Magie, deceased, Andy Holt, South Lyndeboro, N. H.

Executive Committee for three years, J. Andrew Casterline, Dover, N. J., J. F. Converse, Woodville, N. Y.

At the opening of the afternoon session an address of welcome was given by Assistant State Commissioner Flanders, which was responded to by President Turnbull.

A paper was read by Rev. E. F. Pember of Bangor, Maine. Subject: "The Ayrshire Cow for New England," and a paper by the Secretary on the "Relation of Structure to Dairy Yield."

A banquet was served in the evening.

The Inside of this Building in Ten Colors

The "Penny Wise and Pound Foolish"

Policy has an apt illustration in the man who buys a CHEAP gas or gasoline engine. Unreliable service, frequent and expensive repairs, wastefulness in fuel and short life offset many times over, the small saving in first cost. The "OTTO" is the original and BEST. Suppose it does cost a little more money, the extra dollars are well invested. 70000 users throughout the civilized world support us in this claim.

The Moo-Cow-Moo.

[By Edward Vance Cooke.]

My pa held me up to the moo-cow-moo
So clost I could almost touch,
En I fed him a couple of times, or two
En I wasn't a fraid-cat—*much*,

But ef my papa goes into the house,
En mamma, she goes in, too,
I just keep still, like a little mouse,
Fer the moo-cow-moo might moo!

The moo-cow-moo's got a tail like a rope
En it's raveled down where it grows,
En it's just like feeling a piece of soap
All over the moo cow's nose.

En the moo-cow-moo has lots of fun
Just swinging his tail about;
En he opens his mouth and then I run—
'Cause that's where the moo comes out!

En the moo-cow-moo's got *deers* on his head
En his eyes stick out o' their place,
En the nose o' the moo-cow moo is spread
All over the end of his face.

En his feet is nothing but finger-nails
En his mamma don't keep 'em cut,
En he gives folks milk in water-pails
If he don't keep his handles shut.

'Cause ef you er me pulls the handles, why
The moo-cow-moo says it hurts,
But the hired man he sits down clost by
En squirts en squirts en squirts!

—*Saturday Evening Post.*

CONCERNING OUR ADVERTISERS.

The Foster Steel Stanchion.

An article which is always of interest to up-to-date dairymen is the cow stanchion. The Foster Steel Stanchion, manufactured and sold by Frank H. Battles, Rochester, N. Y., is worthy of special commendation In make it is of steel and malleable iron, combining lightness with all needed strength. Its first important point is the perfect freedom of movement it affords the animal, up and down, right and left. This is secured by its chain fastenings above and below. Another valuable point is its simplicity and convenience for fastening in and releasing the animal. There is no possibility of its becoming accidentally unfastened or being unlocked by the cow, and yet a man with mittened hands has no trouble in locking or unlocking. Fastens with a single motion; no danger of pinching or smashing the fingers, affords the greatest possible comfort to the animal. Any one interested in cow fastenings should not fail to write Mr. Battles at the above address for circular and full particulars.

When You Dream

On a warm summer day of the pleasures of winter driving, it all seems delightful—the spirited horses, the crisp air, the scintillant snow. But when you try to enjoy it, in its season—the real thing—how different. The only sensation you can think of, is that you are cold. The luxurious vehicle only serves to remind you of the comfortable, warm rooms at home; the jingling sleigh bells become a jangle, harsh and irritating. But if you have at your feet a Clark Heater, why, then, it's quite another matter. Your feet are warm. In fact, you are warm all over. There is "no fun" without it. For sale by jobbers everywhere. Manufactured by the Chicago Flexible Shaft Co., LaSalle Ave. and Ontario St., Chicago.

Cause for a Strange Malady.

Ed. Hoard's Dairyman:—I have just read on page 1021 of your paper, of a strange malady and am of the opinion that there is something in the condition of the silage that makes it poisonous. What causes me to think thus is: Some 4 or 5 years ago a dairyman whom I know well, turned his herd of cattle into a field where he had grown sorghum for soiling, had been cut two times and had made quite a good start when the frost came. The cattle began to eat ravenously, but in less than 20 minutes nearly the entire herd was lying down. The owner went and drove them out at once, but six died the same day without bloating scarcely at all.

I wrote to Bureau of Animal Industry at Washington, D. C., about the case, but they had never heard of a similar case.

I have read of one or two since. Now, my opinion is, sorghum can get in a condition to make it very poisonous. Whether it is the frost or not, I of course can't say. J. W. B.

Silverton, O.

An Ohio Feeding Problem.

Stale Bread for Cows.

Ed. Hoard's Dairyman:—Am now in charge of a dairy of 30 to 35 head here at the Home, and would like a ration formulated from the following: roughage, mixed hay (⅓ clover, balance timothy) also corn fodder, planted for fodder only and has good many nubbins in; this is all run through a Tornado cutter and cut quite fine and steamed. We are feeding one part fodder and two of the hay in bulk, and the grain feed, consisting of bread, ship stuff and oil meal is mixed in with as much of this steamed feed as they will eat. Then they have all of the dry hay they will eat besides. This bread consists of crusts and mostly nice, light bread that accumulates from the dining halls. We get two barrels of 75 pounds each, to feed each day. We can get pure bran at about the same price or less than the ship stuff we are feeding, and in my opinion ought to be included largely with this bread. Our herd of cows consists of eight thoroughbred Holsteins, weighing from 1,000 to 1,200 lbs., five or six Shorthorns (fine beef type) of about the same weight, the balance of herd is grades of various kinds and will weigh on an average 1,000 pounds or over. These cows are in all stages of milk, ⅓ of them fresh within the last two months; 20 out of 29 of those in milk now, average 3⅓ gallons per day. Please formulate a ration for cows in full milk, and we will gauge the others. W. F.

National Military Home, Ohio.

In the first place, we recommend discontinuing the practice of mixing the grain with the steamed fodder, so that the amount of grain fed to each cow may be better apportioned to her capacity for using it to good advantage. Then feed all the coarse fodder each cow will eat with relish, and 8 to 10 pounds of grain to the heaviest milkers, remembering that the 5 lbs. of bread is equivalent to only about 3¾ pounds flour. We should prefer good bran to the average "ship stuff" and should expect to use, say, 4 lbs. daily and 2 lbs. oil meal. Watch the effect on

EASE, COMFORT AND THRIFT.

each cow, and, if practicable, weigh them frequently to ascertain whether they are increasing too much in live weight. If they do thus increase, cut down the allowance of grain. On the contrary, if they do not increase in live weight, and especially if they fall off, the indications are they they could make good use of more grain.

Consult the article on Revised Feeding Standards, page 1014, and the table of analyses on page 772.

VETERINARY.

Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

Eating the Placenta, Etc.

Is it natural and proper for a cow to eat the placenta when it comes away?

Should a cow be allowed to drink the first milk taken from her after calving?

Is there any positive way of knowing whether a cow is with calf?

Would it be positive proof that a cow 12 years old was with calf, if she had been coming in heat, and then failed to do so, or at least to show it?

Will a cow with calf ever act as though in heat at what would be her first period after service? B. J. P.

Moores Junction, Mich.

ANSWER.

It is not natural for a cow to eat the placenta; as a rule cows in good health will not eat it, nor is it natural for a cow to drink her own milk, especially if it be the first milk (colostrum) which belongs to the calf.

The only positive way to tell whether or not a cow is with calf is to explore through the rectum with your hand. The foetus can be plainly felt by directing your hand toward the right side a little downward at full arm's length.

Indigestion.

I have a three months old calf that is not doing well, acts dumpish: every few days his manure is thin as water, with some gas. He has a humor on his nose and ears. G. S. S.

Livermore Falls, Me.

ANSWER.

Omit the second crop of clover in your ration and see that your feeding utensils are clean; also, see that all other food is of good quality. Give a teaspoonful of bicarbonate of soda in milk twice daily. Physic with 2 table-spoonfuls of castor oil.

You may give a tablespoonful of powdered white oak bard in food twice daily and place the calf in a warm, comfortable stall.

Chronic Diarrhoea.

My horse is a gelding ten years old. He eats fair, but his hair looks rough and he drinks lots of water. He seems dry most of the time. His droppings are very thin, it seems to end with a clear liquid. He has been that way for nearly a year H. W.H.

Barron, Wis.

ANSWER.

If possible ascertain the cause. In long standing cases we generally suspect intestinal worms.

Do not give any food whatever, for at least 12 hours, then give the following at one dose:

Santonin 20 grs., aloes (Barb) 1 oz., oil of turpentine 1 oz., raw linseed oil, 1 pint. After this you may give in moistened food twice daily, 2 teaspoonfulls of the following:

Powdered charcoal, 2 oz, powdered gentain root, 2 oz., dried sulphate of iron, 3 oz. Limit the water to ½ bucket 4 or 5 times daily.

Scours in Calves.

My yearling calves get weak and dumpish-like and then begin to run off at the bowels at a fearful rate. G. H. T.

Cherryvale, Kan.

ANSWER.

Your trouble appears to be in your method of feeding and stabling. Thoroughly cleanse your feeding utensils by washing with soda, and give plenty of light to the stables. Also look after the ventilation, whitewash the walls and disinfect occasionally.

A teaspoonful of bicarbonate of soda in the milk twice daily for each calf, will greatly aid in stopping scours when they first start.

Leaking Milk.

Bought registered Ayrshire in August. Calved 3 weeks ago; has small hole about 1 inch up one of the hind quarters from which milk leaks from about 4 p. m. to milking time. C. S.

Red Deer, Can,

ANSWER.

The opening cannot be closed until the cow is dry, then she must be hobbled and cast, the edges of the wound scarified and brought together with sutures. Dress once daily with any good antiseptic and keep thoroughly clean at all times.

Infection After Abortion.

When a cow has aborted how long is it necessary to keep her from the others, or when is the danger of infection over? E. R.

Boonville, N. Y.

ANSWER.

A cow may carry the germs of abortion for months if she is not properly disinfected; therefore irrigation with disinfecting fluids is absolutely necessary. If a cow has been properly disinfected in this manner, we would consider it advisable to keep her isolated at least 10 days or 2 weeks after abortion has taken place.

Brain Trouble.

Two-months-old Durham calf, while feeding in the morning with others of same bunch, started to run as if scared. By the time it made the circle of the pen it bawled and tail drawn under, muscles all drawn to high tension and twitching. Hind quarters appeared for half hour to be stiff.

Janesville, Wis. E. Z.

ANSWER.

Your calf appears to have an affection of the brain and nervous system, the cause of which may be the presence of parasites. Your case requires the attention of a qualified veterinarian.

GOMBAULT'S
CAUSTIC BALSAM

A safe, speedy and positive cure for

Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a HUMAN REMEDY for Rheumatism, Sprains, Sore Throat, etc., it is invaluable.

"ADVERTISEMENT."

For Singers and Speakers.

The New Remedy for Catarrh is Very Valuable.

A Grand Rapids gentleman who represents a prominent manufacturing concern and travels through central and southern Michigan, relates the following regarding the new catarrh cure, he says:

"After suffering from catarrh of the head, throat and stomach for several years, I heard of Stuart's Catarrh Tablets quite accidently and like everything else I immediately bought a package and was decidedly surprised at the immediate relief it afforded me and still more to find a complete cure after several weeks' use.

"I have a little son who sings in a boys' choir in one of our prominent churches, and he is greatly troubled with hoarseness and throat weakness, and on my return home from a trip I gave him a few of the tablets one Sunday morning when he had complained of hoarseness. He was delighted with their effect, removing all huskiness in a few minutes and making the voice clear and strong.

"As the tablets are very pleasant to the taste, I had no difficulty in persuading him to use them regularly.

"Our family physician told us they were an antiseptic preparation of undoubted merit and that he himself had no hesitation in using and recommending Stuart's Catarrh Tablets for any form of catarrh.

"I have since met many public speakers and professional singers who used them constantly. A prominent Detroit lawyer told me that Stuart's Catarrh Tablets kept his throat in fine shape during the most trying weather, and that he had long since discarded the use of cheap lozenges and troches on the advise of his physician that they contained so much tolu, potash and opium as to render their use a danger to health."

Stuart's Catarrh Tablets are large pleasant tasting lozenges composed of catarrhal antiseptics, like Red Gum, Blood Root, etc., and sold by druggists everywhere at 50 cents for full treatment.

They act upon the blood and mucous membrane and their composition and remarkable success has won the approval of physicians, as well as thousands of sufferers from nasal catarrh, throat troubles and catarrh of the stomach.

A little book on treatment of catarrh mailed free by addressing F. A. Stuart Co., Marshall, Mich.

Buy You a Ticket to CROOKSTON, MINN., and call upon

The Polk County Land & Loan Company

For Choice Red River Valley Farms. They pay railroad expenses if you buy from them. A few good bargains.

360 acre farm, 4½ miles from Crookston, Minn., a city of 7,000 inhabitants, and 2½ miles from the State Experimental Farm. This is a photograph of the buildings as they are today: House is 16x24 1½ stories with an L 14x22, and a wood shed in connection 20 feet square, all on a brick foundation. Barn 28x48, with a lean to 16x48, sheeted both inside and out. Two granaries, one 14x80, and the other 14x42. The buildings are all well painted and in very good repair, and has a fine artesian well. Every acre of this farm is under a high state of cultivation, and is well drained by a slight ravine running through the farm merely sufficient for self drainage. The soil is a rich, deep black loam with a clay sub-soil, and in every respect is considered to be one of the best farms in that vicinity. Our price on this farm is $35.00 per acre.

This is a **320** acre farm about 2½ miles south of the city, this farm is quite well improved, has a very good house of about seven rooms, 1½ stories, barn large enough for ten head of horses, also a good granary, pasture and an artesian well, also has a good well at the house, good grove around the building. This is a very choice piece of land for the price $32.50.

160 acres north-east of the city; this is all hay land, and located in a German settlement, the surrounding country is nearly all under cultivation; we consider this a good piece of land for an investment, this could all be put under the plow, if desired. Price $19.00 per acre.

The Problem of City Milk Supply.

[Address before Missouri State Dairy Meeting by ROB'T. PETHEBRIDGE, City Milk Inspector, St. Louis, Mo.]

Pure milk is a matter of great importance to the health of every community. Good, genuine milk is hard to obtain with certainty in a large city.

The problem of the milk supply of St. Louis, next year, during the World's Fair is claiming the attention of many thoughtful farmers and dairymen. For myself I see but little difficulty, when the matter is brought forward and managed on its true merits, and the prospects for a successful year in the milk shipping business are very bright, and should be taken advantage of wherever possible. Certain rules must govern your actions in determining the course to pursue, and I will endeavor to make some suggestions which may be easily understood and carried out without any difficulty. The first point that strikes me is with reference to the profits which are accruing to a well managed dairy. It is a well known fact that about one-half of the dairy cows in the state of Missouri are unprofitable, yet Missouri is one of the best dairy states, and sometime in the near future will be the leading dairy state.

I wish to impress on all who are keeping cows that it is a waste of labor, time and feed to keep 20 cows, for instance, when only ten are paying their way, and their owners are in a puzzle as to which these ten are. I suggest that everyone should possess a good Babcock Tester, and a pair of scales, and each day's test and weight of milk of every cow be taken and entered on a sheet for the purpose, together with the quantity and kind of feed each cow consumed, or in other words, a debit and credit account kept. If a cow does not give at least 5,000 lbs. of milk, testing about 3.5 per cent butter fat and 9.0 per cent of solids, not fat, my advice would be to get rid of her. It must be remembered the milking should be done properly and at regular hours. Kind treatment must not be forgotten and a cow should be treated like a lady.

Good and persistent milking produces milkers and the development of milking qualities, whereas on the contrary if irregularity and neglect is practiced the talents which would develop with use will naturally disappear, even what there is. It is a great mistake to suppose that dairy cows all belong to one breed. They vary from the Small Kerry of Ireland, the fine Jersey and Guernsey of the Channel Islands, the hardy Ayrshire of Scotland, the dual-purpose Short-horn and Devon of the west of England, to the Red Polled Norfolk of the East of England and others, all of which with selection and development produce magnificent dairy cows.

It is the character of the food more than anything else that determines the size. As we know, in those districts which do not produce rich and abundant grasses you will not find large cows, and in those districts which do produce the necessary constituents for growth and milk producing, in a few years a small bred animal will become the parent of a large type, and with continuous milking will furnish many good milkers. Select and test your cows and use a bull from a family which has a milk record, and remember that your bull is half your herd.

My second point is the labor question, for successful dairying cannot be carried on where labor is short, or where the hired help is lacking. In my travels I find this to be a great complaint among dairymen that they cannot get help, but I am sure it is mostly their own fault, for I can name many successful dairymen who have no difficulty in that line, because they are treated in a proper and business like manner, such as fair wages, regular hours and liberal treatment. He must compare the dairy help with the city laborer in wages; they will vary in different parts of the country in hours of labor; the city man has his 10 hours daily and pay for overtime, whereas the country man as a rule works longer hours, and no pay for overtime. This is one of the great objections of the man working on the farm, for I have known by experience that many a day I have been at work 14 hours in the field with a team and previous to that did the milking and feeding of 10 cows and 4 horses, and then at night have to do the same thing again, when I ought to have been studying or taking some recreation to improve my mind and body, to render it better fit for the duties of the morrow.

Liberal treatment will do more to bring employer and employed together, than wages. The giving of a cottage with a garden patch and allowing them to keep a cow for the use of the children in addition to the weekly wage gives the country employer the advantage over the city, and more work can be accomplished and your man can be relied on, which is very important. In the hiring of labor, there are many good dairy hands coming from England, Ireland, Germany and Scandinavian countries, who are glad to get a job when they arrive in New York, and they naturally seek an employment agency, and those who wish to hire this class can make application, and they will not be disappointed if they are willing to do the fair thing.

In the production of milk I have but little to say, and I suggest that milk-making rations be fed, such as clover and alfalfa hay and silage for rough feed, and for grain and meal feeds such nitrogenous foods as will enter into the production of milk. It is not wise to feed a heavy carbonaceous feed to a milk cow, for you may just as well expect to put corn through a mill and get out wheat flour.

Remember that the quality of a cow's milk in butterfat and solids-not-fat is as natural to her as the color of her hair, and can be but little affected by the food, but with improper rations the quantity will tell the tale at a loss.

THE HANDLING OF MILK.

During the past year, we have had in operation a new milk ordinance, which we consider one of the best in the United States. It is a protection to the honest dairyman as well as the consumer, and its provisions are being enforced in a manner in which all straight minded men will agree.

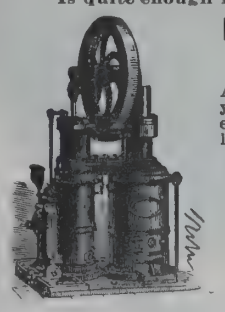
It contains several sections in which instructions are laid out for the quality, cooling, prevention of use of preservatives, and adulterants, which I would earnestly advise all who think of shipping milk to St. Louis to follow. I will name a few so that you can understand which they are.

THE MILK ORDINANCE AS PASSED ON AUGUST 27, 1902.

I will give you an outline of the various sections as regards the milkmen and citizens:

Section 6 gives the city chemist, assistant chemists, and milk inspectors the right to have full access, ingress or egrees to all places where milk is stored

"I had scrofula and erysipelas for eighteen years, until I heard



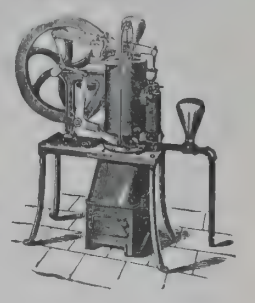
Of Dr. Pierce's Golden Medical Discovery," writes Mr. Hilery Koous, of Queens, W. Va. "When I commenced to take this medicine I weighed one hundred and thirty pounds. I have taken six bottles of Dr. Pierce's Golden Medical Discovery and three vials of his 'Pleasant Pellets,' and am glad to say I feel like a new man. I now weigh one hundred and seventy-five pounds. When I had used one bottle of the medicine I could feel it was helping me. I realize Dr. Pierce's Golden Medical Discovery is the best medicine on earth."

Dr. Pierce's Golden Medical Discovery purifies the blood and entirely eradicates the poisons that breed and feed disease. It cures scrofula, eczema, erysipelas, boils, pimples and other eruptions that mar and scar the skin. Pure blood is essential to good health. The weak, run-down, debilitated condition which so many people experience is commonly the effect of impure blood. Dr. Pierce's Golden Medical Discovery not only cleanses the blood of impurities, but it increases the activity of the blood-making glands, and it enriches the body with an abundant supply of pure, rich blood.

FREE. Dr. Pierce's Common Sense Medical Adviser is sent *free* on receipt of stamps to pay expense of mailing *only*. Send 21 one-cent stamps for the book in paper covers, or 31 stamps for the cloth-bound volume. Address Dr. R. V. Pierce, Buffalo, N. Y.

HALF ENOUGH WATER

Is quite enough for some people, but most people want water every day. If



RIDER or ERICSSON HOT AIR PUMPS

COLONIAL (Flaked) **LIBERTY** (Granulated)

Butter Salts

ARE

"Money Makers for Butter Makers"

The barrel that holds 320 lbs. of the other man's salt will hold but 225 lbs. of **COLONIAL.** Colonial Butter Salt is by far the driest and lightest weight butter salt in the world. Made on purpose to make butter good and to make butter makers money.

Perfect in flavor
Perfect white in color
Purity over 99 per cent, highest known

Don't take our word for what our butter salts will do for **you,** but put it to the severest test **at our expense.** All operators of creameries and cheese factories (only), send us your name and address on a post card and we will send you absolutely free of all charge a 56-lb. sack of either or both Colonial and Liberty Butter Salts. All we ask in return is that you write us of your experience—after trial. There is no reason that we know of why you **shouldn't** give our salt a trial on these terms. If you are prejudiced in favor of some other brand, it is all the more reason why we want you to test our claims. We expect to get you "prejudiced" **in our** favor after thorough trial, and that means a permanent customer for **us.**

Creameries and cheese factories, please favor us with your request for free sample sacks.

COLONIAL SALT COMPANY,
Akron, Ohio

Chicago Office:
84 Adams Street

BUTTER FOR UNCLE SAM

THE CONTINENTAL CREAMERY COMPANY
TOPEKA, KANSAS

Has been awarded the contract to supply the United States Navy with half a million pounds of butter for the ensuing year.

For this purpose only the best quality of butter is used, and its keeping quality must be made of the very best, owing to the fact that the entire year's supply must be made within a few months and it is carried through all conditions of climate.

The government has made a thorough study of supplying butter to suit the requirements of the Navy and, as a result it has laid down some very exacting standards to which those who bid for these contracts must comply. One of the few concerns who can fulfill these requirements is the Continental Creamery Co. and it was awarded this contract, which is the biggest single order for butter ever filled.

This company produces the greatest quantity of fancy creamery butter in the world, all of which is made from pasteurized cream. Surely it knows something about making good butter. It also knows from actual experience and the investigations of its chemists, that one of the factors in making good butter is

WORCESTER SALT--IT USES NO OTHER

FOR SALE BY ALL CREAMERY SUPPLY HOUSES.

WORCESTER SALT COMPANY
168 DUANE STREET, NEW YORK.

or kept for sale, and to take samples of milk or cream not to exceed one pint each.

Section 7 orders these samples to be tested or analyzed by the city chemist or his assistants.

Section 8 provides that when necessary any sample of milk or cream when purchased for his own or family consumption may be submitted for examination by any citizen.

Section 9 provides for cleanliness in handling and hauling milk and cream.

Section 10, all persons who handle milk for sale must register at the city chemist's office and pay a fee of one dollar per year and get a license to sell milk on wagon for which he must pay $2.50 every six months for each wagon, and if he is in the wholesale business and sells in one day to one man or firm 16 gallons of milk or cream, must pay a wholesale license fee of $25 every six months.

Section 11 says that no registration certificate or license shall be transferred, and gives instructions how to obtain same and provides for notice to be given in case of any changes in the business.

Section 12 provides for names on wagons and carriages.

Section 13 provides that all licenses granted shall be on the blank forms to the collector by the register under the seal of the city as prescribed by law.

Section 14 deals with the sale of impure milk or adulterated or skimmed milk when sold as whole milk and must be cooled immediately after milking to at least 45°, and delivered to consumers at or below 50°.

Section 15 deals with the products of impure or diseased milk or cream which is manufactured from unhealthy cows or unwholesome milk.

Section 16 deals with the adulteration of milk or cream by adding water or skimming, with the exception of cases where same is modified for infant or invalid feeding according to a registered doctor's prescription.

Section 17 provides for persons selling milk or cream containing preservatives, coloring matter or any other adulteration, same being rigidly enforced.

Section 18 fixes the quality and method of analysis. Not less than 3 per cent butter fat, 8.5 per cent solids not fat, and .7 per cent of ash, 50 per cent of which shall be insoluble in hot water.

Section 19 fixes the minimum standard for cream, viz. 12 per cent.

Section 20 regulates the sale of condensed milk.

Section 21 provides for the sale of buttermilk,

Section 22 provides for the sale of skim milk, to contain not less than 10.5 per cent total solids of which .15 per cent is butter fat and a specific gravity of between 1.032 and 1.038 and which is free from any foreign additions of any kind. Wagons carrying same, to have signs of skim milk in 3-inch letters on each side of the wagon. All vessels, cans and packages from which skim milk is sold or delivered, shall be marked with the words "Skimmed Milk" in uncondensed Gothic letters, not less than 1 inch in height above the center. Each store, depot of other places where skimmed milk is sold, shall have a sign in plain view or anyone entering, marked "Skimmed Milk", in not less than 2-inch letters. All persons selling or delivering skimmed milk shall place a sticker or lable, 1 inch by 2 inch on which is printed in heavy faced Gothic letters reading "Skimmed Milk", upon the customer's vessel or container, to prevent its being used instead of whole milk for infant feeding.

Manufacturers who make affidavit in the form prescribed by the city chemist, that the skimmed milk they handel shall not be sold at retail as milk, but solely used for manufacturing purposes, shall be exempt from the foregoing provisions of this section.

Section 23 deals with unclean milk.

Section 24 deals with the prevention of carrying out of the duties by others of the inspection officers, in refusing to allow them to perform their duties of inspection.

Section 26 deals with milk or cream from diseased cows and the protection granted by the city to the officers in case of confiscation.

Section 27 provides for sick or diseased cows or other sick animals, on dairy premises.

Section 28 forbids the manufacture and sale of any preservative, coloring matter or other adulteration.

Section 29 instructs the milk inspection officers regarding the inspection of dairies.

The penalties for the offenses against the various sections are not less than $25 or more than $100

I especially call your attention to section 14, in which it provides for the cooling of milk to 45°, immediately after milking and maintaining a temperature of 50° or below, until delivered to customer. This is essential to the welfare of the producer and obviates the use of preservatives, as forbidden in section 17.

The equipment of the dairy is as necessary as the cows, and should be taken into consideration when commencing. The best kind of milking pails and a good cooler and aerator, together with plenty of ice and spring or well water. A steam boiler is a great help in many ways, such as cooking food, providing hot water, and for steaming utensils, and also for running a cream separator, if the shipment of cream is desired.

In the case of these dairymen who live a long way from the market, for their milk, I would advise a line of stations on the rail road for the handling of their milk and cream, and get the rail road to put on refrigerator cars to carry the goods, so that it would be kept cool in the summer and from freezing in winter. There are many stations which could be started and run at good profit, and I am sure the Rail Road Co. would be only too delighted to entertain a proposition for their establishment.

The prospects of a million extra people in St. Louis the coming year, must claim the attention of all dairymen and that the milk inspection department, is taking strenuous measures for cutting out the added water to milk, which in a number of cases is being sold as the pure article, and that alone will necessarily require a large addition to the shipments which are daily being received.

Official Records of Holstein-Friesian Cows, From Nov. 12 to Dec. 3, 1903.

During this period the records of forty-one cows have been received.

Fourteen full-age cows averaged 7 years, 3 months, 8 days; days from calving, 25: Milk 425.4 lbs., butter fat 14.800 lbs.; equivalent butter, 17 lbs., 4.3 oz., per cent fat shown in the milk, 3.52. Twelve four-year-olds averaged 4 years, 6 months, 1 day; days from calving, 18: Milk 382.9 lbs., butter fat 13.342 lbs.; equivalent butter, 15 lbs., 9.1 oz.; per cent of fat shown in the milk, 3.50. Six three-year-olds averaged 3 years, 5 months, 29 days; days from calving, 16: Milk 248.6 lbs., butter fat 12.142 lbs.; equivalent butter, 14 lbs., 2.6 oz.; per cent of fat shown in the milk, 3.47. Nine two-year-olds averaged 2 years, 4

Meat and Milk

Whether you are feeding for market or for milk, you will find nothing else equal to Dr. Hess Stock Food for rapidly producing the results desired. The capacious udder of the improved cow and the long milking period have been produced by special feeding and breeding. The same is true of the improvement of animals bred for weight. A certain per cent. of the feed consumed must be applied to maintaining the system, and it is the food assimilated above this requirement that furnishes the profit. The addition of Dr. Hess Stock Food, the great stock tonic, to regular feed so invigorates and improves the organs of digestion and assimilation, that a minimum amount of feed is required to sustain life, repair waste, etc., and a greater amount is available for the production of meat and milk. If you have a stringy calf, a lean hog, a backward steer or a poor milker, get

Dr. Hess Stock Food

to-day and you will be astonished at the results. It is the only scientific compound for horses, cattle, hogs and sheep. Formulated by Dr. Hess (M. D., D. V. S.) If the medical and veterinary colleges know of nothing better it must be good. No unprofessional manufacturer can equal it.

Our Information Bureau For any disease or condition for which Dr. Hess Stock Food is not recommended, a little yellow card enclosed in every package entitles you to a letter of advice and a *special prescription* from Dr. Hess (M. D., D. V. S.) In this manner you are provided with a universal treatment for all stock diseases, either in the Stock Food itself or in the special prescription to which the little yellow card entitles you. Endorsements from physicians, scientists and feeders furnished on application.

DR. HESS & CLARK, Ashland, Ohio.

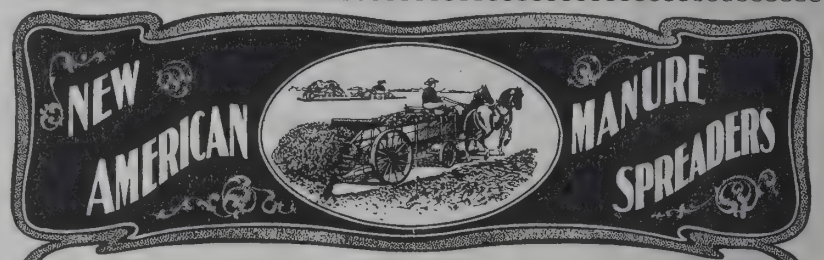
Also Manufacturers of Dr. Hess Poultry Pan-a-ce-a and Dr. Hess Healing Powder.

Dr. Hess Stock Book Free. A complete treatise on stock and poultry diseases, written by Dr. Hess (M. D., D. V. S.), and sent free postage paid, if you will write Dr. Hess & Clark, Ashland, Ohio, and say what stock you have—how many head of each kind; what stock food you have fed, and mention this paper.

Prof. W. S. Goss, Dean of Talladega (Ala.) College, says of it: "I think Dr. Hess' Book a little gem, I shall keep it near me for reference."

Dr. Hess Stock Food is sold on a written guarantee, 100 lbs. for $5.00 (except in Canada and Pacific Slope) **smaller quantities at slight advance. Fed in a small dose.**

Instant Louse Killer Kills Lice.



A BUSY HEN is a profitable hen whether she be laying, hatching or taking on fat for market. Nothing will aid so much in all of these occupations as small daily feeds of **Prussian Poultry Food.** It not only helps in eggs, growth, etc., but also prevents and cures **gapes, cholera, roup** etc. and helps in **moulting.** "I have tried the Prussian Poultry Food for roup and it cured my flock. For keeping poultry in condition, and especially as an egg producer, it stands without an equal. Every one that keeps poultry ought to give it a trial and be convinced."—B. H. PAYNE, Painesville, Ohio.

Price 25 and 50 cents. If by mail, 40 and 75 cents, Pails $3.50. Ask your dealer. If not there, write us. We will see that you are supplied and send you our **68 page book free.**

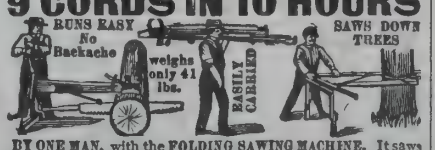
A Guarantee That Guarantees.

We desire to call special attention to the guarantee made poultry raisers by the Cyphers Incubatot Co., Buffalo, N. Y. They warrant their incubators for ten years, and guarantee that they will hatch a larger percentage of fertile eggs and produce more vigorous chicks than any other incubator in the world, at the same time consuming less oil and requiring less attention. As the guarantee is backed by a large and responsible company, it certainly means something to our readers. They agree to refund the purchase price in case the purchaser does not get satisfactory results. The Cyphers incubator, as is now well known, is constructed on a patented principle entirely different from any other machine on the market; it is absolutely self-ventilating, self regulating, requires no supplied moisture, is automatic in action and has the most sensitive and accurate regulator made.



The company carries in addition a full line of "poultryman's necessities," standard articles specially prepared for the poultryman who wants to make money. They will send their new complete catalog for 1904 free if you tell them that you are one of our readers.

Here is the Split Hickory Special For 1904

The thousands of well-pleased customers throughout the whole United States to whom we have sold this truly wonderful bargain in the past few years know what we mean when we say "Split Hickory Special." We have taken a great pride in building up a mammoth business on this one particular job, bending every effort in our manufacturing plant to give our customers a buggy for $50 that had every good feature put on a buggy at any price. Our efforts have been rewarded Our sales last year on this one particular job ran into hundreds every day. With such an immense output, selling direct to the customer, we are enabled to offer many new inducements this year. If you are thinking of buying a buggy you cannot afford to overlook the Split Hickory line. Remember, this Split Hickory Special is made of first grade Split Hickory—split, not sawed—and has 100 points of merit. Space in this advertisement will not permit our giving a description of this vehicle. It is fully described in our new 136-page Split Hickory Catalogue of vehicles and harness, now ready for distribution. It's free. Send for one at once. NOTE—We carry a full line of high grade harness, sold direct at wholesale.

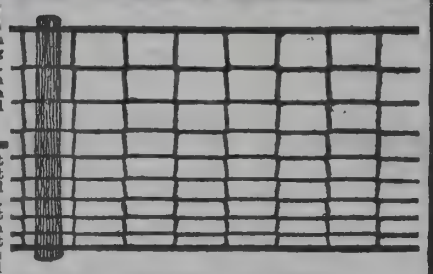
WE LEAD THE WORLD

We are the largest manufacturers of Grooved and Plain Tire Steel Farm Wagon Wheels in America. We guarantee our patent Grooved Tire Wheels to be the best made by anybody anywhere. Write us.

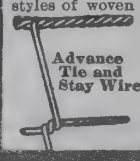
HAVANA METAL WHEEL CO.
HAVANA, ILL.

The Strongest Fence Made

To sell direct to the farmer the strongest fence in the world, we must not only use the best ***HIGH CARBON SPRING STEEL WIRE,*** heavily galvanized, but we must build so that the greatest textile strength of material is maintained. Sixteen years, spent in perfecting ***Coiled Spring Fence,*** each year showing an added degree of perfection, has brought us to a point where we can proclaim with a confidence born of attainment that



OUR FENCE IS THE CHEAPEST AND BEST



Cheapest because the highest skill of the craft has been utilized to reduce the cost of manufacture, and this achievement, coupled with the largest output of the largest and best equipped plant in the United States devoted to fence manufacture, enables us to name you the ***VERY LOWEST PRICE AND WE PAY THE FREIGHT.*** Buy direct. We sell to you as cheap as dealers can buy. Put the dealer's profit in your own pocket. Examination permitted at your station; your money back if not as represented. Completion of sale rests wholly upon your judgment. Write us; we have something more to say to you. After correspondence is opened, you have your judgment to defend your interests at every advance of the deal. Our Catalogue is free, and is full of fence lore.

COILED SPRING FENCE COMPANY,
Box 103 **Winchester, Indiana, U. S. A.**

The First Thing to do

If you are going to buy any fence this season, the first to do, for your own protection, is to send for **FREE FENCE BOOK** It tells all about **ADVANCE FENCING** which is without question of doubt the best fencing on the American market. It also tells how you can buy this fence **Direct from the Factory** at wholesale prices, freight paid to your station, doing away with all dealer's and jobber's profits. It also tells how **Advance Fencing** is sent to you **ON 30 DAYS' FREE TRIAL** so that you may have every opportunity of being perfectly satisfied that you have the best that your money can buy. Our **Fence Book** gives description and prices on twenty-three different styles of woven wire fencing, a fence for every need on the farm, garden or poultry yards, and also tells why **Advance Fencing** is the most desirable kind to have on the farm. It has many points of merit. It has no loose ends, the stay wire is not cut at the top and bottom as in other fence, but is woven into the top and bottom strands between the stays. The **Advance Tie** is perfect, the stays cannot slip. **ADVANCE FENCE** is made of heavy material throughout. You should send for our **Fence Book** at once, it is **FREE.** Your name and address on a postal card, directed to us will bring the **Fence Book.** It pays to keep posted. **Write today. Do It Now.**

TUBULAR WINS AGAIN

BUCKET BOWLS CHALLENGE IN A BUNCH AND GET A TERRIBLE BEATING

The following is an extract from the Minneapolis, Minn., Tribune, of December 18th, 1903, and should be positive proof that we make no unjust claims for Tubular Cream Separators. We have won too many contests to leave a shadow of a doubt of Tubular superiority.

FAIRMONT, MINN., Dec. 18th.—The most important event in the Minnesota Dairymen's Convention, held here this week, was the contest over close skimming, between the manufacturers of the various cream separators. The test was made in public, over a hundred of the leading creamerymen watching it with the closest attention.

The four leading makes of cream separators were in the contest. The judges were: Robert Crickmore, manager of the Co-operative Creamery, Pratt, Minn.; A. W. Trow, president of the Minnesota State Daitymen's Association; and E. J. Henry, traveler for the Diamond Crystal Salt Company, and an acknowledged expert with the Babcock tester.

The matter grew out of the claim made by the Deere & Webber Co. of Minneapolis, who are Northwestern agents of the Sharples Cream Separator, that this separator would skim more than twice as close as any other separator on the market; and, further, that the saving would pay for the machine in the course of one year's ordinary use.

In order that the matter may be fully understood, the Tribune gives herewith the challenge of the other manufacturers and the official report of the judges.

The claims of the Sharples are more than borne out by the figures, and there is evidence of rejoicing in the Deere & Webber establishment in Minneapolis today over the result. The challenge read as follows:

THE CHALLENGE

TO THE AGENT OR AGENTS OF THE SHARPLES CREAM SEPARATOR:

Gentleman: In the catalogue published by the Sharples Cream Separator Company, with Deere-Webber attached, and used by them in their trade catalogue, on pages 24 and 25 we note the following:

"Notwithstanding the fact that we resort to no complications whatever, we will place a Sharples Tubular Dairy Separator beside the best separator of the best other make in existence, and absolutely guarantee to cut in half any other record for clean skimming which such other machine may make.

"On hot milk or cold milk, fresh milk or stale milk, cow's milk or goat's milk, rich milk or poor milk, thick skimming or thin skimming, we will guarantee the Tubular to skim so as to leave but one-half the fat in the skim milk that any other machine will leave under the same conditions.

"If the other machine skims to one-tenth, the Tubular will skim to half a tenth; if the other skims to two hundredths, the Tubular will skim to one hundredth; if the other skims to one hundredth, the Sharples will skim to a half.

"Furthermore we will guarantee that when used regularly in a dairy, proportioned to the capacity of the machine, that the Sharples Tubular will give enough more butter from the same milk, than any other known machine will give, to pay not less than 6 per cent yearly interest on the whole cost of the separator."

We, the undersigned, offer this as a fair consideration to enable you to prove what is contained in the above assertion. We agree to furnish enough milk free of charge and agree to use the same quality and temperature of milk. We offer to make two runs of 200 pounds each with each machine. The first run to be at a temperature of 70 degrees, the second run to be at a temperature of 96 degrees, no machine to skim a cream of a density of less than 30 per cent butter fat. We agree to run our machine of as nearly equal claim capacity according to book of instructions. The runs to be made in a building known as "Machinery Hall" in Fairmont, Minn., on December 17th., 1903. Competent judges to be selected to determine the results.

To show our good intentions we hand the treasurer of the Minnesota State Dairymen's Association a certificate of deposit against the Martin County National Bank, Fairmont, Minn., for ($100) one hundred dollars, said $100 to be used as said association may wish, if you can prove your claims as published in said catalogue.

This offer to be accepted or rejected at once in the presence of not less than three witnesses.

The challenge was signed by the representatives of the parties in interest and was accepted by the representative of the Deere & Webber Company.

THE REPORT

THIS IS WHAT THE JUDGES SAY ABOUT THE CREAM SEPARATOR TEST:

Fairmont, Minn., Dec. 17, 1903.

We, the undersigned, judges in the above contest, hereby certify that the run made by the following separators in pursuance of the above agreement was as follows:

As milk could not be obtained for only one run, it was made at a temperature of from 62 to 70 degrees, each machine being given 200 pounds under identically the same conditions. The tests were as follows:

	SKIMMED MILK	CREAM TEST
Alpha	.175	32.5
United States	.125	50.
Empire	.450	19.5
Sharples	.05	25.

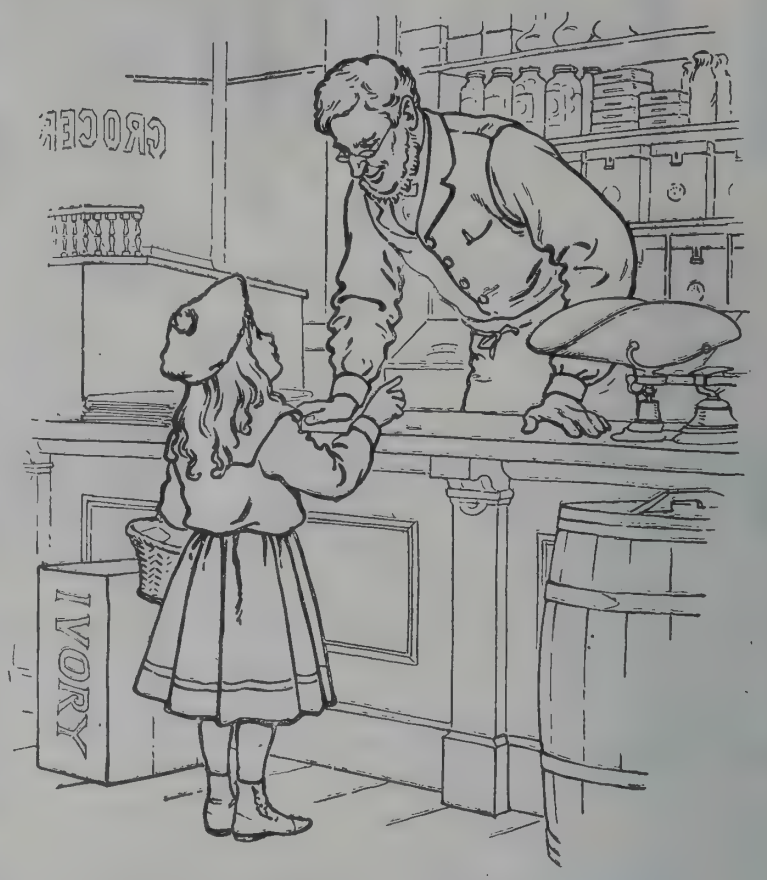
Alfalfa in North DaKota.



As I am a believer in alfalfa I wish to give my experience in growing it without irrigation. I have a farm at Eldridge, Stutsman county, N. D., and in the spring of 1901, I secured 100 pounds of Turkestan seed and thirty of Grimm's Minnetonka, and sowed it on about ten acres of very rich land which had been heavily manured several times. It came up nicely and was about a foot high August 1st, when we cut it, securing fourteen loads of hay which was mostly weeds and pigeon grass. It made very good hay for sheep. When the stock came from the herd about Oct. 1st, the second growth was up nicely and quite thick, but the sheep and cattle would not let it alone, and it went into the winter without a spear in sight. Much to my surprise it started up nicely in the spring of 1902, and the sheep again kept it nipped until they went to the herd, June 12th. I am now surprised that this pasturing did not kill it, and I think it did injure it, making it quite thin in places. About August 1, 1902, we cut a very good crop and could have cut another crop in the fall, but the stock again helped themselves to it before we got at it.

In the spring of 1903, it came up nicely, though thin in places, as the result of pasturing, I now think. We cut our first crop June 21st, and the second was ready to cut August 1st, but we saved it for seed, and cut it for that purpose about Sept. 20th. We threshed this seed with a common threshing machine, securing 360 pounds of seed and chaff. When cleaned, we expect to have about 200 pounds of good seed which I shall sow on ten acres more of heavily manured land by the side of the other. I doubt if the thresher secured more than half of the seed, but we had no clover huller within reasonable distance, so did the best we could.

Last spring, I secured 20 pounds of seed which came from the far north in Russia, and sowed it with barley on two acres of rich ground. The season was so dry in June and July that it did not do very well, but is all alive at the present time, and about as high as the barley stubble, which was cut when ripe. Where the barley was best, the alfalfa is best, showing that the barley did not hurt it, but rather helped it. I am now convinced that alfalfa can be raised in all the James River country of Dakota, if you get the proper seed, and if you manure the land heavily. We got as much seed this season from the Grimm's Minnetonka, of which I have about two acres, as from the 8 acres of Turkestan. I know parties who are trying seed from Wisconsin and from Utah and their fields have done well for two seasons; but, it is hard to tell what the next two seasons will bring to any of us. My field to-day (Nov. 1st.), is green and, by far, the best feed on the farm—CHAS. B. CLARK, in *Dakota Farmer.*

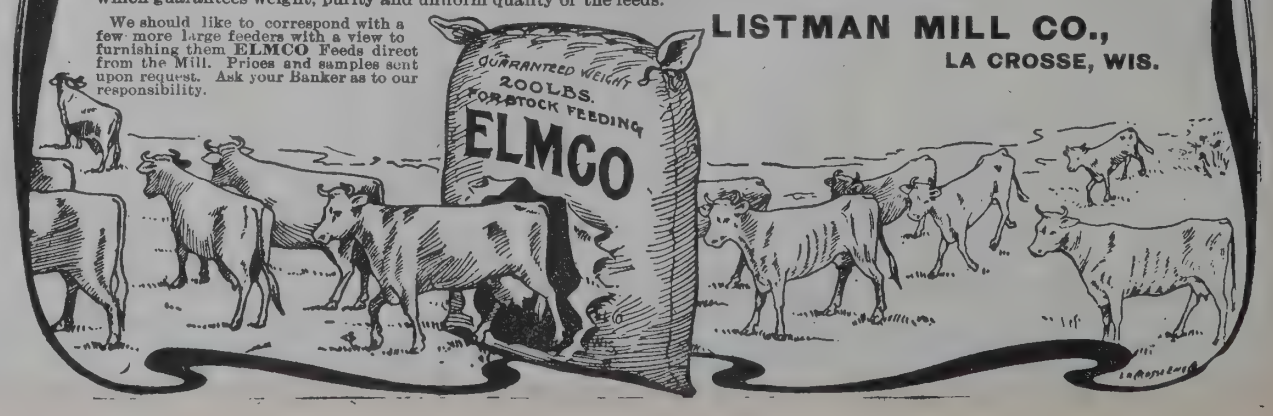
PROFIT AND PROTECTION
THROUGH ELMCO FEED

Had you the time and facilities to analyze all the feed you use, it might be safe for you to buy in bulk. But you haven't and to buy bulk feed without applying chemical test, is like buying a horse on his looks.



Feed may look all right but be light in nutrition or heavily adulterated. Twenty-five per cent of seventy-eight samples of bulk feed analyzed by the Massachusetts Experiment Station showed serious adulteration. Ground corn cobs, coffee bean hulls and other purely fibrous substances were discovered.

The feeders protection against such fraud, is the purchase of feeds which have been analyzed by the Agricultural Experiment Station and are packed in sacks, bearing the trade mark of some responsible miller who guarantees the quality, strength and weight of the feeds contained in the sacks.

ELMCO Feeds have been analyzed by the Wisconsin Experiment Station and found to be pure, unadulterated and profitable feeds for milk or fattening. They are not patented or medicated stock foods, but hard Spring wheat feeds, carefully milled for best feeding results, packed in the ordinary sized sacks, branded with our copy-righted trade mark, "ELMCO" which guarantees weight, purity and uniform quality of the feeds.

We should like to correspond with a few more large feeders with a view to furnishing them **ELMCO** Feeds direct from the Mill. Prices and samples sent upon request. Ask your Banker as to our responsibility.

Convention Afterthoughts.

Features Commendable and Otherwise at the N. Y. State Dairymen's Meeting.

ED. HOARD'S DAIRYMAN:—Taking it as a whole, the meeting at Ogdensburg, N. Y., certainly must be called a success. What reports I have thus far seen about it unanimously express the same verdict. Still it seems to me that it would be more beneficial to all concerned, certainly more interesting, if reporters and observers would not try quite so much to say only things pleasant to all, patting people on the back, so to speak, but would mingle their praises with a few well-aimed kicks, which might temporarily make the receivers feel a little sore, but undoubtedly would in the end have the desired effect. I suppose I am a born kicker, the only trouble is, I do not always get the chance I want (as it just happened at the late convention) and then, the only way I have to give vent to my ire is to ask for space in the dairy papers. How many will read and heed my kicks is another question; some may kick back, which I rather like.

The various dairy papers have given a pretty correct idea both of the numerous exhibits as well as a resumé of the too numerous addresses by the many well-known specialists present. I shall only pick such subjects to kick about or comment upon, in which I am specially interested, and upon which my readers will admit that I have a considerable experience.

A REPORTER'S IMAGINATION.

All probably agree that the great labor necessary in advance of the convention to make it the success it was, was admirably carried out by Sec. W. W. Hall, and the only sad thing was that the overexertion undoubtedly was the cause of his illness, which even prevented his sharing the results of his work during the meeting. But not even his illness or absence could prevent the ever alert reporter of the New York *American* from publishing some extracts from an address by Mr. Hall (which he never made!) in which he had dwelt upon the terrible condition of the shipping cans as returned by the city dealers to the country, and suggested as the best remedy, that cans of the very cheapest material should be used so they might be thrown away after a few trips! Great Scott! Well, I showed Mr. Hall what he had said and hope it did not give him a backset! As I hardly can credit the reporter for quite so much invention, I guess some friendly joker had "posted" him. And that was all the New York *American* had to say about the whole convention.

It is far more pleasant to quarrel with our friends than with our enemies, and as I sat listening to the good things Professor Pearson said, waiting to hear the still better ones he left unsaid, I was just aching for an opportunity to pick a friendly quarrel with him regarding the possible and practical means to supply better and purer milk to all the people of our cities. My chance never came, but that is another kick to be applied separarately. Remembering a bulletin by Mr. Pearson on "Market Milk" and also his late connection as general manager of the Walker-Gordon Co., I had my grave suspicions that he would only speak about "ideal," and consequently expensive milk for the favored few, and not about milk of such possible purity which would put it within the reach of those people whose pocketbook is not always full.

Let me say first, that I fully agree with Prof. Pearson and others, that it is proper to encourage all dairy farmers as to the more careful production and handling of milk and sanitary precautions generally, and that it is right, at dairy schools and by other means of instruction, to teach how such ideal milk may be produced. But let us not deceive ourselves and others by even suggesting as a possibility that the bulk of that ocean of milk used in our cities, will be or could be supplied of such ideal character and at prices only slightly higher than what reputable dealers furnish milk for to-day. It neither will nor can be done during this generation, or the next if ever, and we want to find means and methods by which we can supply all the children, the invalids and the well people, rich, poor and the great host between, with such milk which every physician can recommend as safe and wholesome, and that at prices so reasonable that the demand will increase and yet the supply be sufficient.

I took down a few of Prof. Pearson's statements especially worthy of comment. He said one-third of the cows of this country produced milk for market; just think what it would mean, not only to educate one third of our milk producers to be conscientious, careful and sanitary, but to provide them with means necessary to put everything connected with cows and milk in sanitary condition! He admitted it as an "unsolved problem" to economically produce and handle sanitary milk, and it will remain an unsolved problem as long as we keep on harping about certified, ideal milk.

Prof. Pearson is right when he said, "We want pure milk," but we shall never have it for the masses as long as we will not adopt some other more practical method, as proper pasteurization will surely prove to be, as in fact, it already does prove in many places. When Prof. Pearson stated that almost all milk was used raw, he is hardly correct; in several cities to-day, notably in the West, over half of the milk sold has been pasteurized, and during the last couple of years pasteurized milk exclusively is supplied by several of the largest dealers in New York, Philadelphia and Chicago. Some are distributing pasteurized milk without saying anything about it, and some, I am sorry to say, are claiming by elaborate signs that they furnish pasteurized milk in sterilized bottles, when frequently the facts are that some milk never was pasteurized at all, only simply heated in some makeshift fashion, and the sterilization of bottles only a fairy tale.

But such misdemeanors cannot be blamed to the system of pasteurization, but partly to the dishonesty of certain dealers, partly to the lack of proper milk inspection, which will become far easier and less expensive when pasteurization of all milk is made compulsory, except such supplied from specially inspected sanitary dairies. Prof. Pearson was exactly correct saying that "good milk increases the demand," but he surely knows as well that higher prices do not. And with all respect to sanitary precautions, it is mere nonsense telling average farmers that the expense would be trifling to produce such milk as would pass the standard of the Milk Commissions for "certified" milk. If it were so, certainly more than four dairies in Philadelphia and six or eight in New York (some of them quite small) would to-day be furnishing such. The undeniable fact is, that the visible results from all the labor of the milk commissions have been very slight, and I have my doubts whether by their over-strict demands they have not done more to discourage farmers from efforts to produce pure milk, than otherwise. Few only are producing a truly sanitary raw milk, and fewer claim that it pays, even if they get a much higher price than for average milk.

The trouble is, that much so-called certified milk to-day is no more sanitary or wholesome than much other milk, which may be had for almost half the price. I think Professor Pearson was a little inconsistent when he first said that conditions necessary for the production of clean milk was easy for thousands, who could cheaply change from unsanitary to sanitary conditions (I only put down the meaning, not the words); and afterwards stated that the extreme care of producing and handling milk for retail was not necessary, for that supplied to a creamery! Why not, when the expenses were so slight?

The fact is Prof. Pearson knows as well as I, even better, that the Walker-Gordon Co., H. B. Gurler and others, could not produce certified milk and do business unless they got the high price, because the expenses are very considerable and the distribution very costly, because the customers are scattered and only small quantities are taken for special purposes. Even the wealthiest people are not willing to pay extra prices for milk used for general household purposes, but will buy such milk from a cheaper source.

While we all agree with Prof. Pearson that cleanliness is the first essential for all sanitary milk supply, yet I for one do not agree with him when he says "aerating, straining, clarifying and pasteurizing are all only means of partially offsetting uncleanly methods." If that is so, then cooling likewise should be put in the same class; but it is true neither of pasteurizing nor cooling. No true friend of pasteurization believes in less cleanliness. On the contrary we know from actual experience that since the introduction of compulsory pasteurization of milk and cream at the creameries in Denmark, the general standard of cleanliness and care in milking has been enormously raised, because today no milk, even slightly sour, will be received at any creamery. The cleaner and sweeter the raw milk, the better the pasteurized product. Pasteurization is not a makeshift to improve bad milk a little, but a means to make good milk better and keep better and be freed from such contamination as may have taken place.

What is the use to keep on telling us about a few dairymen who ship milk five hundred miles in good condition, or somebody's raw milk keeping sweet six weeks, when we know such work is impractical for ninety-nine out of one hundred dairymen? As the supply of milk for our great cities almost entirely must come from large dealers or corporations, these are the parties to compel the farmers to supply only clean and sweet milk, without preservatives which have become entirely superfluous wherever pasteurization has been properly adopted by the dealer. Prof. Pearson himself admits that much benefit for general milk supply may be gained by proper pasteurization and I do not conceive his object in absolutely avoiding saying anything about it in an address on Market Milk.

DISCUSSION FIRST POSTPONED, THEN ENTIRELY OMITTED.

Mr. Monrad called attention to the lack of time allowed for discussion of important subjects at former conventions, and the same happened again. Mr. Van Wagenen was to open the discussion; he made a talk himself of some ten minutes, when Pres. Cook came forward and stated that as the time was short, it would be better to postpone the discussion until the next day's meeting, those desiring to take part in the discussion to raise their hands; which I did for one. When the meeting was opened next day, we were informed, as many wished to leave by 3.30 train and wanted to hear Prof. Hunt and Gov. Hoard, they would speak first; that was the last of any allusions to any discussion on "Market Milk" or any other subject. I know a great number agree with Monrad and myself, that it is a serious mistake to have so many addresses that all discussions are crowded out. No matter how fine the addresses, they are more or less one-sided and only by discussions have we a chance to draw out different views. I would suggest to limit all addresses to ten or fifteen, possibly twenty, minutes, and then by program allow at least twenty or thirty minutes to questions and discussions. It would be worth trying any way.

GUERNSEYS AT PASTURE.

Dairy Questions Answered by Prof. Farrington.

ADVANTAGES OF A CREAM RIPENER.

We are going to get either a new cream vat or a Farrington ripener, and we would like your opinion in regard to which will be the better one for us to have. Can we cool cream in the ripener with water that comes from the well at 51 degrees so that we will not have to use ice in the cream? At the present time we are using an open vat, and add large pieces of ice directly to the cream. Will the cream remain cold over night after it has cooled in the ripener? How long does it usually take to cool ripened cream? We are at present getting 18,000 pounds of milk per day and our cream vat is not large enough to hold all the cream we are now getting.

Milton Junction, Wis. * * * *

If you have a good supply of cold wa-

ter I think you will be able to control the cream during ripening by using the Farrington ripener. We have three different kinds of ripening vats at the dairy school and find that we use the Farrington ripener more than any other, because we are able to have the cream under our control better than when it is ripened in an open vat.

I do not like the practice of adding ice directly to the cream, because the cream around the lumps of ice is reduced to a much colder temperature than that a little ways from it. This will naturally make an uneven ripening, and although in some cases it is necessary to add ice to the cream, I think it is better not to do so.

It usually takes longer to cool ripened cream than sweet cream because the ripened cream is thicker and does not flow so easily in the vat.

At such a large factory as you have, I presume you keep up steam during the entire afternoon, and are probably at the factory until evening. If this is the case it will be no trouble for you to pump water and run the ripener in the afternoon. In a small factory, where not much cream is received, the buttermaker often gets through his work by noon, and then allows the steam in the boiler to go down and the fire to go out. He is, therefore, not able to pump water for cooling the cream in the ripener at five to six o'clock, when such cooling is usually needed. This is about the only reasonable objection that I have ever heard made to the Farrington ripener, at small creameries, but in such a factory as yours where the machinery is in running order all day, you will not be troubled with such a thing.

The time required to cool cream in a ripener will depend entirely on the amount of cream you have to cool and the size of your ripener. If you have more cream than will be held in a three hundred gallon ripener I think it is better to get two ripeners than one larger than this.

Brine Salting Butter.

"What is the best method of salting butter? Do you use brine or dry salt and which method do you prefer? I am using a combined churn and worker and have some difficulty in getting my butter evenly worked and salted. If you prefer the brine method will you kindly tell me something of how you make the brine and put it in the churn and what proportion you use to the pound?" * * * *

Boise, Idaho.

The nearly universal practice at the present time is to use dry salt in salting butter. The cream is churned until the butter granules are about the size of wheat grains; the buttermilk is then drained off, water is added and after one or two washings of this granular butter it is allowed to stand in the churn until the surplus water is drained out, the dry salt is then added to this butter in the churn. It is ordinarily sifted through a fine sieve in order to prevent either small or large lumps of salt getting into the butter. The butter is then revolved in the churn about a dozen times and allowed to stand a few minutes; it is then worked in order to complete the even mixing of the salt through the butter and the explusion of any buttermilk and surplus water which may be held by the granular butter.

The amount of salt which remains in the finished butter product, depends a great deal on the amount of working that the butter receives after the salt is added. If the granules are particularly moist, the salt will be easily squeezed out by the working and leave the butter comparatively fresh in taste although considerable salt has been added to it. If on the other hand the granules are very dry when the salt is added to them, so much brine is not expelled by the same amount of working as will be the case when the granules are more moist.

In brine salting of butter a solution of salt is made by adding an excessive amount of salt to water with frequent stirring. The amount of brine that should be made will depend entirely on the size of the churn and the amount of butter to be salted. Enough brine is needed to completely cover the granular butter in the churn. The brine should be made up to a saturated solution, that is keep adding salt to the water until no more of it will disolve and a certain amount is deposited on the bottom of the vat or can in which the brine is being made.

The supernatant liquid, or the liquid above the salt, may, when it is wanted for salting the butter, be added to the granular butter in the churn in the same way as dry salt was added as previously described. The granular butter is allowed to stand in the brine in the churn some little time and the churn revolved a few times. The brine is then drawn off and saved, the butter taken out of the churn and worked a very little. As a rule it will not need so much working as in the case when butter is dry salted. It is rather difficult to get a sufficient amount of brine to stay in the butter and give it the necessary salt taste.

Brine salted butter as a rule is too fresh for the general market. This is also an expensive method of salting butter, because a great deal more salt must be used in making the brine than would be used if dry salt was added directly to the butter. It is possible that the surplus brine after it is drawn from the churn may be used a second time but it will naturally accumulate a certain amount of dirt by constant use and it is not a very convenient liquid to keep, as brine will attack tin vessels in which it is held if kept for any length of time.

I do not know that brine salting of butter is practiced to any great extent. It is a good way to make light salted butter, which is not often mottled, but will have a very uniform color.

If you are using dry salt at the present time and are having some trouble with mottles or unevenness in the body and texture of your butter, you may easily overcome this by working your butter several times, that is, increase the amount of working which you have been giving your butter in the past. If you have been in the habit of working the butter in your churn a certain number of revolutions, say twenty, in the past, divide this twenty revolutions into four periods of five revolutions each and allow the butter to stand half an hour or more between each working. This, I think, will overcome the trouble you are now having.

Changing Richness of Cream.

"I take the liberty to ask you if hand separator cream will vary much in test, and if so, what are the causes of the variation?" * * * *

Cameron, Wis.

The richness of hand separator cream will vary at different times if the separation is not alwys carried on in exactly the same way. There are some separators which will skim milk thoroughly, even when there is considerable variation in temperature of the milk skimmed, the amount of milk allowed to run through the machine and the speed of the bowl, but as a rule the majority of hand separators now on the market, must be carefully run and the condition of the milk as to its temperature and amount as well as speed of the bowl must be uniform each time it is used, if satisfactory results are obtained in the skimming.

The richness of cream as it comes from the separator is increased first, by increasing the speed of the bowl. Second, by diminishing the amount of milk allowed to run through the separator. Third, by heating the milk to a high temperature. Fourth, by keeping water out of the bowl when starting it and stopping it. Fifth, by turning in the cream screw of the separator bowl.

The richness of cream is decreased first, by forcing more milk through the separator bowl than it was built to skim. Second, by skimming cold milk. Third, by low speed of the separator bowl. Fourth, by turning out the cream screw in the separator bowl. Fifth, by adding water to the bowl before the milk is allowed to run into it and flushing the bowl with water when the operator has finished skimming the milk.

These are a few of the points each owner of a hand separator ought to be familiar with, and he ought to know the influence which these different changes in speed, temperature, etc., have on the richness of the cream and the test of the skim milk. When he becomes familiar with these things, there will be no difficulty whatever in skimming milk at the farm, which will be uniform in richness from day to day.

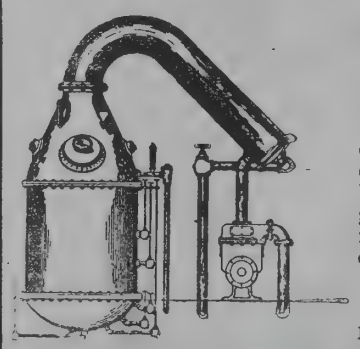
Holstein-Friesian Special Prizes.



The World's Fair committee of the Holstein-Friesian Associatian of America is sending out an address to breeders and exhibitors of Holstein-Friesian cattle, relative to an especial effort toward an exceptional display of that breed at St. Louis next September. The committee is composed of six prominent breeders, with W. J. Gillett of Rosendale, Wis., as chairman.

The address makes the following reference to the World's Fair prizes offered by the Holstein-Friesian Association:

"Public esteem and the merits of the Holstein-Friesian breed demand that a most creditable show of our cattle be present at this great Exposition. Realiz-

ing the importance of a representative exhibit of Holstein-Friesians at St. Louis, the Holstein-Friesian Association of America has offered special prizes for exhibits of its cattle, which, together with the regular prizes offered by the Exposition, make a sum to be competed for in amount never before offered at any live stock show. It will be seen from the arrangement of prizes offered that the large and the small breeder have an equal chance of winning something, and that it would be hardly possible for any herd of ordinary merit to show at St. Louis and win nothing. Great things are expected of us, and the Holstein-Friesian Association appeals to its breeders with an urgent request that the display of our cattle shall far surpass any previous exhibition."

Acid in Silage.

ED. HOARD'S DAIRYMAN:—I built a silo last fall and filled it with corn that from appearances would yield about 120 bushels of ear corn to the acre. We like it and the cows seem to do well. But there is a question that is bothering me; our silage, like all silage that I have seen, while it has a pleasant, sweet smell, not unlike Atlas gluten meal, yet it contains considerable acid. Now acid cannot be in anyway nutritious; it may be all right as a condiment, but surely the sugar and starch that has turned to acid must be lost as nutriment.

I would like to know if any of our agricultural chemists have ever worked out the problem, and know really what the real loss of nutriment is per hundred lbs. of the ensilage, as compared to one hundred pounds, before it is fermented, each, of the stalks and grain, separate?

I am quite taken with the silo, and if it could be kept without the acid, I should feel that the question of caring for the corn crop had been nearly settled. But am inclined to think the grain had better be kept separate. Am I not right? Would add that our corn was cut into the silo when it was nearly all glazed, and was just common yellow and some white dent variety. S. A. B.

Albion, Mich.

The acids of silage is a question which has caused much unnecessary discussion and many faults have been attributed to them, from decaying the cows' teeth to souring the milk. The fact is that the amount of acids in silage is of little influence except as an appetizer, and does not represent any appreciable loss in feeding value of the corn, even if it were entirely worthless as a food, which it is not.

One hundred tons of sweet silage would contain about 600 pounds of acid, which if entirely lost would have a value of about $1.00; but as it has an actual feeding value about equal to the carbohydrates from which it is made, the presence of acids in silage is of no disadvantage, and is far outweighed by the saving which comes from this method of handling corn.

Some Good Results from Connecticut.

ED. HOARD'S DAIRYMAN:—I see that many of your readers get up and speak their piece. I wonder if I should write mine, I should be told to go way back and sit down. Well here goes anyway. I own about twenty acres of land, fifteen of it is tillable, the balance pasture. I have rented for the past two years thirteen acres more; five acres of this would cut about ½ ton of hay per acre, but I had sowed corn for ensilage on half of it and mowed the rest. The other eight acres is simply exercise ground for my cows. I think I built the first silo in this state and you can imagine some of the names I was called for the first few years.

The cow has been my hobby as a farm animal; have cared for them for over fifty years and been owner of them for over forty years. Last year was my banner year. With an average of nine cows, I sold cream and milk wholesale from them to the amount of $1,369.61, besides the milk used by two families. Pork sold, $182.66. This includes one hog used at home, at the price I could sell it for. I kept four horses from Jan. 1st 1902 to Jan. 1st, 1903; one extra for five months, I got some of this year mixed. Sold $65 worth of hay in barn and had hay left. My neighbors said I could never do this again, but my motto is to advance, never to retreat.

This year I shall cross the line, head, neck and shoulders ahead of last year. I commenced to read the DAIRYMAN Jan. 1st, 1903, and think some of my success, if I may call it so, is due to it. I have read farm papers for over fifty years; do not think I ever received much harm from them. I do not know what a balanced ration is, but I have frequent talks with my cows and what suits them tickles me immensely.

Norwalk, Conn. HIT OR MISS.

Milking Quality of Polled Angus Cows.

ED. HOARD'S DAIRYMAN:—Some of your readers may be interested, as I have been, in the testing of the quality of milk from Polled Angus cows. I have been milking a herd of between 30 and 40 of them for some time on my farm at Harvard, Ills., and enclose copy of letter from the Oatman Condensed Milk Co. regarding the tests made from their milk.

Dundee, Ill. Dec. 5, 1903.

GENTLEMEN:—It gives us pleasure to report to you the result of a test made at our Harvard Factory, of your dairy of registered and high grade Polled Angus cows. The samples submitted by your foreman, Mr. Esmond, tested out very clear, and the samples from the four cows submitted for test on Nov. 22nd averaged 5.85% butter fat, and the samples tested on the 29th of the same month averaged 5.32%. The test made from the milk of your entire herd of grade Angus cows has averaged from 4% to 4.50% butter fat for the entire season, which is one of the highest, if not the highest test, of any dairy coming to this factory.

Thanking you for your many kind favors of the past, and soliciting a continuance for the future, we are Yours very truly,

THE OATMAN CONDENSED MILK CO.

From my experience with these cows for a number of years, and from this and other reports regarding the quality of their milk, I am satisfied that well selected Angus cows are valuable for dairy purposes as well as for beef, and the quantity of milk given will compare favorably with the average herd of grade dairy cows.

This fact and the other fact, that they give milk a longer season than others, are both much in their favor.

Chicago, Ill. J. H. M.

Trouble from Feeding Silage.

ED. HOARD'S DAIRYMAN:—The trouble with the cows of G. B. T., Ocala, Fla., is he should feed silage with cotton seed hulls until they get used to full feeds of silage. If his sorghum was put up too green he must be careful not to give large feeds at once. I had the same trouble.

Selma, Ala. W. H. H.

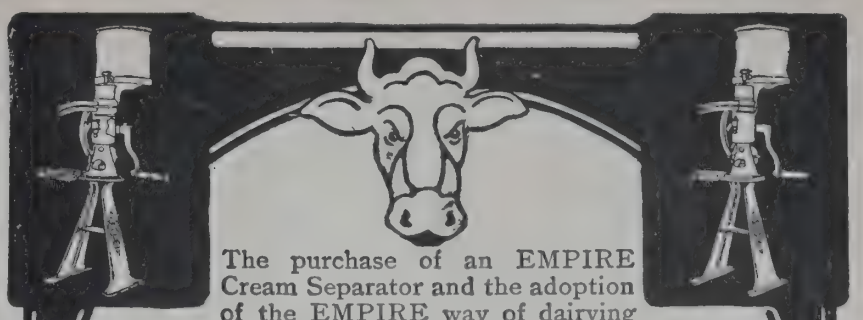
DOCTOR'S SHIFT

Now Gets Along Without It.

A physician says: "Until last fall I used to eat meat for my breakfast and suffered with indigestion until the meat had passed from the stomach.

"Last fall I began the use of Grape-Nuts for breakfast and very soon found I could do without meat, for my body got all the nourishment necessary from the Grape-Nuts and since then I have not had any indigestion and am feeling better and have increased in weight.



"Since finding the benefit I derived from Grape-Nuts I have prescribed the food for all of my patients suffering from indigestion or over-feeding and also for those recovering from disease where I want a food easy to take and certain to digest and that will not overtax the stomach.

"I always find the results I look for when I prescribe Grape-Nuts. For ethical reasons please omit my name. "Name given by mail by Postum Co., Battle Creek, Mich.

The reason for the wonderful amount of nutriment, and the easy digestion of Grape-Nuts is not hard to find.

In the first place, the starchy part of the wheat and barley goes through various processes of cooking, to perfectly change the starch into Dextrose or Post Sugar, in which state it is ready to be easily absorbed by the blood. The little parts in the wheat and barley which Nature can make use of for rebuilding brain and nerve centres are retained in this remarkable food, and thus the human body is supplied with the powerful strength producers so easily noticed after one has eaten Grape-Nuts each day for a week or ten days. "There's a reason."

Get little book "The Road to Wellville" in the pkg.

The purchase of an EMPIRE Cream Separator and the adoption of the EMPIRE way of dairying have marked the turning point with thousands of cow owners. It has shown them in many instances how to make profit from a branch of their business which had hitherto been tolerated as a necessary evil. There are other cream separators, but only one EMPIRE. There are other cream separators with features of advantage, but there are none which possess so many features of advantage as the EMPIRE. There are none from which the features of disadvantage have been so thoroughly eliminated as in the EMPIRE. There are other ways of dairying, but none so profitable as the EMPIRE way. You can learn all about the EMPIRE machine and the EMPIRE way by reading our book. It's free for the asking.

EMPIRE

The Good Qualities

of all cream separators (you may try and prove free on your own premises) are included in the simple, popular priced

AMERICAN

We don't do much talking. It takes no talk at all to sell it to a man who sees it run. Its advantages are apparent. The separator any cow keeper can afford; just two or three makes it worth while. We sell it everywhere on its merits on the free trial plan. Catalogue mailed free upon application.

American Separator Co., Box 1023, Bainbridge, New York.

WANTED!!

Every reader of this paper who owns a few cows to send for our new catalog of

DAVIS
Cream Separators

Sent free upon request. It will tell you why the Davis Separators are money makers for their owners.

THEY ARE GUARANTEED to separate THOROUGHLY and QUICKLY. Dairymen and farmers find the "Davis" the most economical piece of machinery on the farm. Let us send you full particulars about it

DAVIS CREAM SEPARATOR CO.
54 to 64 N. Clinton St., Chicago.

Omega
The one that Separates

The Easy Way,
The Best Way,
The Only Way

to get best results from your dairy operations is to use the

OMEGA SEPARATOR.

It's the one which turns easiest, skims closest, lasts longest and costs least for repairs. We issue a book called "Milk Returns" which you should see before you buy a separator of any kind. Tells all about the "Omega", and the experience of its users. We mail it free. Write for it today.

The Omega Separator Co., 22 Concord St., Lansing, Mich.

Creasey Ice Breakers

Dairymen and shippers of milk and cream find them most efficient, economical machines, and the greatest savers of time and ice. Easy to operate. Rapid cutters. The design is right. Made in sixteen sizes to suit every requirement. Send for catalogue "11-B" which gives full particulars.

J. S. L. WHARTON, Mfr.,
17th Clearfield St., Philadelphia, Pa.

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of them read dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own light who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

AS IT IS IN INDIANA.

C. P. Goodrich took a cow census at Plymouth, Ind., a few weeks since of 50 farmers patrons of a creamery. Note the following facts: The total number of cows was 250: the average cost of keeping per cow was $24.96; the average returns in butter fat per cow was $32.20; the average number of pounds of butter fat per cow was only 166; the average net price was 19.4 cents: the average net profit per cow above cost of feed was $7.24; the average returns for $1 worth of fead was $1.29. The six patrons who read a dairy paper averaged $21 per cow over and above the cost of feed, while the 44 who did not read a dairy paper received only $5.58 per cow above the cost of feed. Does it pay to go without sound dairy reading?

THE CHEMIST AND THE FARMER.

The source of all our scientific knowledge of feeding comes from agricultural chemistry. The ordinary farmer does not believe that the chemist knows any more about feeds and feeding than he does, and so there is a gulf between the two. HOARD'S DAIRYMAN gives full credit to the man who has lived by practice alone, and knows nothing of the chemistry of feeds. But he is a very much mistaken man if he thinks he knows so much that he has no need to learn more. Outside of all he knows is a vast store of valuable knowledge which he may read and digest if he will but increase his knowledge of the terms used, so he may understand what he reads. A great many farmers who realize that they need this scientific knowledge have said to us in effect as follows: "What am I to do? I would gladly read more, as you advise, but I have never had a liberal education and I cannot understand the terms that are used. I want the knowledge but it is locked up behind a lot of scientific language the meaning of which I have never learned. What shall I do?

This looks like an almost insurmountable difficulty, but it is not. Any man of average intelligence can educate himself to an understanding of scientific terms by use of a good dictionary and constant reading. As we familiarize our minds with certain forms of language, their meaning becomes clear and apparent. No man ever learned to swim by keeping away from the water. The only way to educate and enlarge our judgment is to force our minds into contact with knowledge. These long winter evenings are just the time to increase our stores of knowledge. The dairy farmer should be just as hard a student of books as any other man in society. Henry's Feeds and Feeding and Webster's Dictionary will soon put any good man into an understanding of the meaning of the terms of agricultural chemistry, and what a different man he will feel himself to be.

MORE FACTS.

HOARD'S DAIRYMAN is a great believer in the education of facts. It believes that as a dairy journal it should constantly set forth dairy facts as a source of education to its readers. Any line of facts which serve to show how a farmer can build up a profitable herd of cows, is particularly welcome.

There is such a wide difference in success, between the earnest, energetic farmer who makes a dairy student of hinself, and the average farmer who keeps cows, almost any kind of cows, in almost any kind of way. It is the facts relating to this great difference, that we are after all the time. That is the reason we spend so much money on the taking of these cow censuses. It means showing up the facts, between the man who will not think and read and strive to do better, and the real dairy farmer, and the examples of good, wide-awake farmers, who are making a fine profit and a splendid example of themselves, are multiplying, as John Gould would say, "with frightful rapidity,"

The reason of it is because there are so many more men each year who are coming into the ranks of the readers and thinkers. They are fine workers too and they get good encouragement for working.

The great, consuming purpose of HOARD'S DAIRYMAN is to increase the number of farmers who keep herds of cows at first-class profit. That means the use of brains. We are not after big herds of cows, poor cows, but rather a great lot of small herds, say 10 to 20, which are composed of first class dairy cows.

Here is another example of a man who has grown in dairy faith and righteousness. Mr. J. W. Helmes of Adrian, Michigan has a small herd of 11 registered Jersey cows. He built up this herd himself from one cow. Here is the story as he tells it himself. It is a record any farmer could make if he will but read and think on these things. Mr. Helme says:

"I finally purchased a granddaughter of the Jersey cow Matilda 4th, for which I paid $300 spot cash. She was in calf to the best living bull at that time, the sire of Ida Marigold, who had just won sweepstakes at the World's Fair. She dropped me a bull calf—just what I wanted to head my new herd. Pretty big price, you say. Well, she was the best investment I ever made. Last year, at the age of sixteen years, she dropped me a calf that I sold for seventy-five dollars, and gave me 7000 pounds of milk, which sold in the form of cream for over $100, and she has been doing this for each of the nine years she has been with me. She was not a phenomenal milker, but very persistent, hard to dry up, rugged and healthy. She had a pedigree in which every animal had been a star. This is what counted the most. To-day, every animal in my herd, twenty-five in number, are her daughters and granddaughters, and every one in milk will produce more milk and butter, when mature, than she."

"The milk of this herd is made into cream and the cream sold directly to the consumer in Adrian. Considerable skim-milk is also sold, at two cents a quart. Balance of skim-milk goes to feed pure bred calves, all of which are sold for breeding purposes. Under such circumstances the returns are hardly a fair comparison for the average dairy herd. I give them for what they are worth. Cream and skim-milk sold during the year, $1,350; young stock, $325; making gross returns of over $150 per cow."

"These figures do not include milk and cream for a family of six, nor two quarts a day for the hired man, nor butter that we get from an occasional churning when the cream trade is dull, nor calves on hand dropped during the year."

Now in face of all such facts, where hundreds of men are making handsome profits with Jerseys in both registered and unregistered herds, there are thousands of farmers who go to nearly the same expense with scrub, dual-purpose cows, and who say they had as soon have a goat on the farm as a Jersey. Is there anything on earth that a man will pay as much for as he will for his prejudice? The old colored preacher said: "Every man hugs his own foolishness same as he duz his children, kase dey belongs to him."

VALUABLE DATA.

Mr. J. H. Ingham, of Pennsylvania, writes a very interesting letter to the *Ohio Farmer*, the purpose of which is to controvert the assertion made by the senior editor of the DAIRYMAN to the effect that there was no profit in cows which gave only 125 pounds of butter a year. Mr. Ingham cites the following record which we are glad to lay before our readers for the purpose of placing such data within our files:

The most comprehensive, exact, and valuable statistics of individual farm dairying that I have ever seen published are those of Zadoc Pratt of Prattsville, Greene Co., N. Y. I produce his statistics because the conditions under which he carried on the dairy business were similar to the conditions under which some of us are surrounded now. He carried on the dairy business from 1857 until 1863, inclusive—a period of seven years. As he kept 50 cows the first six years and 80 cows the seventh, I find it easier to take the first six years and the 50 cows, and make it a general average for six years as follows:

Average quantity of milk per day for each cow for 8 months, 18 pounds or 9.46 qts.

Average weight of butter per day from each cow for 8 months, 11.48 oz.

Average number of pounds of butter from each cow for season of 8 months, 180 lbs.

Average value received for each quart of milk made into butter, 1.77c.

Average price received for butter for six years, 24.2c.

Average amount of cash received for butter from each cow, $43.56.

Average amount of pork fattened from milk of each cow per year, 129 lbs.

Average price received for pork per pound, 10c.

Net profit on 50 cows each year for six years, after deducting all expenses and allowing $700 for interest on capital invested, $1,439.32.

Average net profit on each cow per annum over all expenses, $28.78.

His 7th year (1863) with 80 cows, owing to the higher prices caused by the war, was the most profitable of all, but I have not included that year in the calculation. He valued his farm and 50 cows at $10,000, and his net profit on his capital was 21.4 per cent per annum. When we bear in mind that he commenced business in 1857, a year of great business depression, and that the first four years that he followed it were previous to the civil war and inflated prices, we can readily admit that his tables are safe ones to go by, if we only practice the same care and economy. His cows were native stock; he had no cattle to sell, no motive to misrepresent, and so far as I know, his statements have never been disputed. The average price he received for butter (24.2c) was not excessive; we are getting that much now.

The 830 farmers and their herds which have been studied in these columns through our "cow census" work, affords very close and accurate data as to what proportion of creamery patrons are making a profit, and the per cent of profit or loss. No such data on this question was ever before laid before the dairy public.

AN OBJECT LESSON IN CREAMERY MANAGEMENT.

We desire to call the attention of our readers to the annual statement, published in another place in this issue, of the Iola, Wis., creamery. This institution is rightly considered one of the first-class creameries in this state. The community about it is composed of a class of thrifty, wide-awake Norwegian farmers, but they had had no training or education in the special lines of dairy farming.

The creamery was started something like ten years ago, but it did not flourish well. A little over six years ago the patrons hired Mr. C. L. Passmore as buttermaker. Mr. Passmore was a hard student in the art of butter and cheese making. But he was not satisfied, as many creamery buttermakers are, with just his day's work inside the creamery. He is patient, tactful and a good mixer with his fellow men.

At the end of the second year his patrons sent him to the Iowa Dairy School for a three months' term of instruction. One great secret in Mr. Passmore's success in building up the Iola creamery has been his idea that the foundation of all true progress in this business is the promotion of the education, and consequently the larger profit of the farmer who produces the milk.

He has done everything in his power to get his patrons to see how to do better work; how to become better dairy farmers; in short, to help the farmer to so conduct his share of the business that he may obtain from it the largest profit possible. To do this well the average creamery patron needs much friendly instruction in the matter of handling the skim milk, compounding rations, handling and stabling his cows; all these and many more details constitute the sum of successful dairy farming. All these things Mr. Passmore recognized as a part of his duty as a buttermaker. He has also done all he could to promote a taste for sound dairy reading. The result of such an excellent combination of ability and wholesome purpose has made a model creamery and a happy, prosperous dairy community.

A Quebec Letter and Inquiry.

ED. HOARD'S DAIRYMAN:—Enclosed please find one dollar for Prof. Decker's book on Dairying. I hope you have heard from some of the farmers to whom I distributed some sample copies of your paper.

I am starting a dairy, having purchased a farm of 150 acres last August and found 7 old cows, 3 three-year-old steers, 5 two-year-olds, 5 yearlings, and 7 calves, all poor stock, but as I bought them cheap, I sold almost all off, and have commenced buying good stock, and have now 7 good, large, young cows, well bred for dairying. One recently calved and is giving 35 lbs. of milk per day, and will get as soon as I can find them, ten or twelve more cows.

I find your paper invaluable and think you are more than doing your duty in giving such valuable information to your wide spread correspondents, considering the climate, soil, etc., in replying for balanced rations. I therefore send you a list of feed to be had in this neighborhood, hoping you will reply to me as to others. There is no silo on the place, but will have one next year. I have probably between hay and unthreshed oats and barley about 30 tons. My men object to feeding unthreshed oats, or partially

threshed on the barn floor, by horses stamping it out, saying it was too much work and waste. A veterinary doctor told me the partially threshed oat straw was as good and better than hay, but owing to the difficulty of getting help, I am afraid I will have to thresh out my oats and buy hay. I have some yearlings and calves yet, also four horses.

The price of feed here is for middlings, $24 per ton; bran, $19; pea meal, $29; ground wheat, $28; barley meal, $27; gluten meal, $25; cotton seed meal $27; corn and oat meal, $23; on hand 200 bushels potatoes, $10; shelled corn, $22; oats 40 cents per bushel, 36 lbs.; on hand 15 tons hay, $10 per ton.

Kindly send me a ration for cows freshening in March, and ones just calved, also for young stock, for I believe in feeding all animals properly. J. G. L.

Melbourne, Quebec.

We quite agree with the veterinarian as to the feeding value of the unthreshed oats, but should prefer not to have them tramped by the horses. Feed direct from the bundle once a day, and hay once a day, all that will be eaten without unnecessary waste. This should suffice for the young stock and very likely for the cows to freshen next March. Add, if the indications appear to demand it, a moderate allowance of the ground corn and oats, and an occasional mess (6 to 10 lbs.) of raw potatoes to keep the digestive tract in good order.

For the milch cows that are capable of giving 35 lbs. of milk, daily, add to all the hay and sheaf oats they will eat, 4 lbs. bran and 4 lbs. gluten meal, daily, not omitting salt.

A Texas Feeding Inquiry.

Is Rice Bran Good for Cows ?

ED. HOARD'S DAIRYMAN:—Enclosed please find part of advertising letter containing analysis of rice bran.

Will you kindly state in your paper what you think of it as a feed for milk cows? If you think it O. K., will you kindly give me a balanced ration of the following feed stuffs, bearing in mind that I am not making butter, but am after milk: Rice bran, wheat bran, cotton seed meal, cotton seed hulls and pea vine hay.

I have never seen where you included hulls in any of your rations, but down here cotton seed hulls are the principal feed stuff for milk cows. The butter here is awful, being white and brittle and sticks to the roof of the mouth like cold tallow. I am aware of the fact that the awfulness of the butter, is due to the feeding of so much cotton seed.

Longview, Texas. H. T.

The advertising letter referred to contains, among other matter, the following statement, said to have been made by the Louisana State Chemist, concerning the digestible nutrients in rice products, namely:

	Protein	Carbohydrates	Fat
Rice bran (30% hulls)	6.39	36.50	5.43
Rice polish	7.25	6.00	4.36
Rice meal (pure bran free from hulls)	8.80	42.00	10.50

It further states that feeding rice bran has no bad effect on stock of any kind, and from the sample sent us by another Texas correspondent, we should be inclined to the same opinion, were it not for the fact that about two years ago, Professor Connor of Clemson College, S. Carolina, wrote us that rice bran had not proven a satisfactory feed in the herd under his care, and a few weeks later, a gentleman at Mobile wrote confirming Prof. Connors's opinion. Both say that, if fed at all, it should be in relatively small amounts.

This is all the direct evidence we have on the subject, but until it is disproven, we cannot feel at liberty to recommend feeding rice bran except in limited quantity and in an experimental way.

It is true we seldom recommend feeding cotton seed hulls. They contain comparatively little digestible nutriment and that little not easily digested. In the absence of other and better roughage, they serve the very necessary purpose of filling the stomachs, the same as straw does in the grain growing sections, but contribute very little otherwise towards milk production.

As an average allowance for a herd, feeding some cows more and others less, according to each one's ability to respond at the pail, we are of the opinion that the following formula may be helpful by way of suggestion:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
10 lbs. cow pea hay	8.93	1.08	3.86	.11
10 lbs. cotton seed hulls	8.89	.03	3.31	.17
4 lbs. wheat bran	3 52	.50	1.54	.12
2 lbs. cotton seed meal	1.83	.74	34	17
Totals	23.17	2.35	9.05	.57

If thought desirable, in view of what has been said above, one might substitute 2 lbs. of rice bran for the same amount of wheat bran.

Program of the Wisconsin Dairymen's Convention.

WEDNESDAY, FEB. 10, 1904.

FIRST SESSION, 9:30 A. M.

Opening Exercises. Introductions and Individual Greetings.
Welcoming Address by the Mayor.
Response by officers of the Association.
President's Annual Address.

SECOND SESSION, 1:30 P. M.

A Local Cow Census and its Lessons - - - - H. C. Taylor, Orfordville
Address - W. D. Hoard, Fort Atkinson
A Day at the Dairy School - - - - Clarence T. Bragg, Bloomer
Appointment of Committees.

THIRD SESSION, 7:30 P. M.

A most interesting special program is in preparation, which will include addresses by Mrs. Adda F. Howie, and others, interspersed with music, readings and short talks.

THURSDAY, FEB. 11, 1904.

FIRST SESSION, 9:00 A. M.

The first hour of this session will be given over to an inspection of the various exhibits.

What Forage shall the Dairy Farmer Raise - - - - C. L. Everett, Racine
The Farmer's Cow - - - - C. P. Goodrich, Fort Atkinson
Veterinary Address, for Men Only - - - - Dr. A. T. Peters, Nebraska

SECOND SESSION, 1:30 P. M.

Address Mrs. Adda F. Howie, Elm Grove
Needs of the Southwestern Wisconsin Cheese Industry - - U. S. Baer, Madison
Wisconsin Swiss Cheese Industry - - - - Fred Marty, Browntown

THIRD SESSION, 6:30 P. M. SHARP.

Annual banquet with post prandial supplement.

FRIDAY, FEB. 12, 1904.

FIRST SESSION, 9 A. M.

Wisconsin's Creameries—Their Needs and Duties - - - James G. Moore, Albion
Bacteria and Milk Supplies for City or Factory Use - Dr. H. L. Russell, Madison
Address on Veterinary Topics - - - - Dr. A. T. Peters, Nebraska

SECOND SESSION, 1:30 P. M.

Cheap Feeds for our Cows - - - - Chas. L. Hill, Rosendale
Feed and Care of the Dairy Cow - - - - J. R. Danks, Madison
Milk and Honey - N. E. France, Platteville

PREMIUMS.

The Association offers the following premiums on butter and cheese made in Wisconsin.

$30—SWEEPSTAKES—$30.

For the exhibit of butter scoring the highest number of points $15.00
For the exhibit of cheese scoring the highest number of points $15.00

$170—PRO RATA FUND—$170.

The balance of the amount set aside for premiums, amounting to $170, will be merged into one fund, instead of being divided into three funds as heretofore, and will be awarded on the excess, pro rata plan to all entries, whether of butter or cheese (excepting those winning sweepstake prizes), which score 91 or more points.

Exhibitors will be limited to one package in each class and in no event will more than $15 be awarded to any exhibitor. Entries from the same dairy, creamery or factory under different names or by different exhibitors are prohibited, and if made will work a forfeiture of any award made to said entries.

On all premiums amounting to $5.00 or over (except sweepstakes) there will be a deduction of fifty per cent if the exhibitor does not attend the Convention.

Send to the Secretary at Fort Atkinson for entry blanks.

RULES.

BUTTER AND CHEESE EXHIBIT.

1. Entries may be made in the name of the owner of the dairy, creamery or factory, or the maker, but not by both.

2. Every exhibitor must be a member of the Association. One dollar secures an annual membership and the report of the convention.

3. Butter may be made at any time and exhibited in prints, packed in eight pound pails, or twenty pound tubs or over, but the pails are preferred.

4. Scale of points for judging butter: Flavor, 45; grain, 25; color, 15; salting, 10; packing, 5. Total 100.

5. Scale of points for judging cheese: Flavor, 45; texture and stock, 30; color, 15; finish, 10. Total 100. Cheese scoring highest will become property of the Association. Duplicates of score cards will be sent to exhibitors.

6. Exhibitors will be limited to one package in each class.

7. Butter and cheese may be shipped by express, charges prepaid, with name and address on each package, to H. K. Loomis, Platteville, Wis.

Manufacturers and dealers are invited to make exhibits of dairy goods and farm machinery of all kinds. No award or premium will be given. Ample and convenient room provided.

TRANSPORTATION.

Arrangements have been completed whereby all the railroads in this state, with their accustomed liberality toward this association, will grant an open excursion rate of one and one-third fare for round trip tickets from all points in Wisconsin. Tickets will be sold at all points from February 9 to 11 inclusive, and also on February 12 from points in Wisconsin from which the one-way rate to Platteville is $3.00 or less; all tickets good to return until and including February 13th. This concession does away with the bother of demanding receipts or certificates when purchasing tickets and having them countersigned by the Secretary or special agent.

C. M. & St. Paul Ry. Trains—Arrive 1:35 p. m. and 9:50 p. m. Depart 7:05 a. m. and 1:50 p. m.

C. & N. W. R. R.—From the north going south, 11:25 a. m.; 5:35 p. m.

From the south going north, 8:40 a. m.; 2:15 p. m.

G. W. BURCHARD, Sec.
Ft. Atkinson, Wis.

Concerning Ajax Flakes.

ED. HOARD'S DAIRYMAN:—As general eastern agents for Ajax Flakes, we wish to say in reply to recent inquiry in your columns from one of your correspondents at Unionville, Mass., that this feed is made from the gluten of corn, it being the by-product of factories which use corn exclusively in distilling alcohol. It is sold under this special name "Ajax Flakes," so that farmers will not confuse it with other feeds of a lower protein analysis. It is registered and analysis guaranteed in all of the various states east and west, which have a feed stuffs law, so that the consumer in buying this particular brand of feed is fully protected. It contains 34 per cent protein and 11 per cent fat. CHAPIN & Co.

Boston.

DON'T PUT OFF

Seeing your friends and having them join in for a club of subscribers.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain sepecific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

Harrowing a Meadow.

We have some meadow that is not mossy but close, thick stubble, and we think ought to be harrowed. Please say when is the proper time to harrow and whether to use the disc or hackle tooth. A. E. M. & BRO.

Foss, W. Va.

Harrow in the spring as early as the ground is fairly dry and warm. We should not use a disc harrow unless the other, well weighted if necessary, fails to loosen up the sod. It is quite the fashion now to use the disc on alfalfa fields, but this is done more to split the crown and make two plants out of one, than to break up the sod.

For a Massachusetts Milkman.

Am starting in the milk making business. My first step was to subscribe for your paper, and second to get the advice from those who are up-to-date, as I want to begin where the most successful are working.

My cows are fresh but do not give any more than average of 26 lbs. for November and the same amount thus far this month. They weigh about 800 lbs.—Holstein grades and Ayrshire grades.

I have an abundance of ensilage and very little hay. Can buy fine hay "cow hay," for $16 per ton. My ensilage is fair; some of it eared out and mixed in silo. Grain can be bought for the following: Malt sprouts, $1 per cwt.; bran, $1.20; middlings, $1.25; cotton seed meal, $1.50; gluten feed, $1.35; yellow meal, $1.20; white meal, $1.25. I put salt in grain, and water once a day. Will you advise how to care for them for best result for profit? G. H. C.

Danvers, Mass.

An average of 26 lbs. of milk per day is not so very discouraging and probably as much as these cows can be expected to reach during the present period of lactation. We should not care to buy much hay at the price named, but would feed more silage, say 40 to 45 lbs. daily. In addition we should expect the cows to eat 4 to 6 lbs. of hay and this in connection with 3 lbs. malt sprouts, 3 lbs. bran and 2 lbs. gluten feed, would be ample, in our opinion, to prevent further undue shrinkage in the flow of milk.

An Illinois Feeding Problem.

I am feeding now daily: wheat bran, 10 lbs.; gluten feed, 8 lbs.: oil meal, 4 lbs.; brewers grains, dried, 8 lbs., and all the clover hay they will eat and also salt, a little every day. It seems to me my cows do not look right for the feed they get, nor milk enough. R. C. R.

Baldwin, Ill.

Inasmuch as this inquirer omitted to state the number of cows receiving the 30 lbs. of grain daily, we are quite unable to form any opinion as to whether the feed should be increased or decreased. It is, however, evident that with clover hay for roughage, the protein is out of proportion with the other elements. We think it would be wise to add an equal amount of ground corn, or corn and cob meal to the mixture mentioned, making 60 lbs. in all, and enough, with clover hay *ad libitum*, to supply 8 cows for one day.

From British Columbia.

Would you kindly form an economical ration, with feed at the following prices: Crushed oats, $28; oil cake, $28; bran, $25; wild grass and timothy hay, $10; carrots, $7 and oat straw. By what mathematical process do you find a balanced ration? Whether is mangels or carrots the better feed for milch cows, and which variety of either roots would do better on a rich peat swamp previously sown to barley in 1902 and oats last year? How would rape do on such land?

Victoria, B. C. SUBSCRIBER.

It is generally considered that mangels is a more profitable crop than carrots, and that there is but little room for choice as to variety; but neither mangels nor carrots would prove a profitable feed at $7 per ton.

The process by which we arrive at suggestions for balanced rations, is to assume that the average cow will require about 16 lbs. of dry matter in the form of roughage. From the table of feeding analyses as given on page 772 we select such concentrates as will fill out the ration in protein, carbohydrates and fat to the standard adapted to the conditions we have to meet, not being over particular if there is a variation of a few hundredths, or even tenths, of a pound. For the average herd, with not too many strippers in it, we try to have the digestible protein from 1.8 to 2.2 lbs., the carbohydrates approximately 12 lbs. and the fat ½ lb. or more. The more practice one has in selecting feeds to meet these requirements, the more adept he becomes.

In the case of our correspondent we would select equal parts by weight of bran and oats and add one to two pounds oil cake, depending somewhat upon the quantity of straw fed.

A Wisconsin Ration.

From the following feeds will you please tell me how much of each would be the best to feed small grade Guernsey cows to give the most milk. Bran, $16.50; lots of clover hay and corn stalks and any amount of ground corn and cob.

Lake Geneva, Wis. K.

Try first a daily allowance of 15 lbs. clover hay, 6 lbs. stover, 2 lbs. bran and 4 lbs. corn and cob meal. This, with proper care given the cows, will probably suffice to enable them to give 20 lbs. of 4 per cent milk. If the milk contains 5 per cent fat add 1 lb. bran. For 30 lbs. of milk testing 4 per cent, let the allowance of grain be 2 lbs. bran, 4 lbs. corn and cob meal and 2 lbs. gluten meal, or 1½ lbs. oil meal; for a similar amount of 5 per cent milk, make the addition 3 lbs. gluten feed, or 2 lbs. oil meal and another pound of bran. And do not omit salt, a large teaspoonful night and morning.

In case it seems expedient to feed more corn stover and less clover hay, 15 lbs. of the former and 8 lbs. of the latter, the basic allowance of grain should be increased by 2 lbs. of bran and a similar increase for different amounts and qualities of milk. Watch each cow carefully from day to day and if any of them do not respond to increased feed by an increased flow of milk, but rather use it for increase of live weight, you may be sure they are overfed.

As to Rice Bran.

I will mail to you to-day under separate cover Nos. 1 and 2. Number one is wheat bran, such as we can buy at the mill in our town at from 85 cents to $1.05 per hundred. No. two is rice bran and can be bought here at $15.80 per ton. I would like to know the relative value of the two brans as to feeding value for milk. I am milking from 8 to 12 cows for the retail milk trade. Can't ask you to analyze the feeds. Would only ask for your public opinion as to their value. If you will, you may make me a balanced ration out of the rice hulls, cotton seed hulls and cotton seed meal. D. M.

Taylor, Texas.

See the answer to H. T. of Longview, Texas, where the subject of rice bran is discussed at some length.

As to a satisfactory ration for milch cows, where cotton seed hulls is the only roughage, we have to admit that the problem is too much for us. We are told that cows in the South are frequently condemned to such forage, but the better and more prosperous dairymen there feed very few hulls. They raise corn for silage, and cow pea hay, and those most up-to-date are trying alfalfa. This is what this correspondent should do without delay, but meantime he should purchase, if possible, some good hay of some kind, to help out the cotton seed hulls, and let the grain part of the daily ration be, say, 4 lbs. wheat bran, 2 lbs. rice bran and 2½ to 3 lbs. cotton seed meal.

Experiment Station Addresses.

Will you kindly give me the location of the different experiment stations in the United States and the price of their bulletins, those which are not gratis, and if any of them are published in a single volume and the price.
West Newton, Mass. W. S. C.

Following is a list of the agricultural experiment stations with names of the directors:

Alabama—College Station, Auburn, J. F. Duggar.

The several stations send bulletins to all residents of the state where the station is located, upon request, and those living outside of the state can usually obtain bulletins by sending a two-cent stamp with their address. The annual reports which usually contain the bulletins issued through the year can be obtained in the same manner.

Silage Corn and Silage Twelve Miles Away.

Have rented a dairy farm twelve miles from home. The land all around the city is very poor corn land. There are two silos to fill and I fear I cannot raise corn enough on this thin clay land to fill them. Have a 100 ton silo on my home farm and can raise corn there. Could I fill my own silo and start my team the next day and haul one wagon load per day and transfer all this silage to my rented farm, or could I haul one or two loads per week in cold weather, just as my cows used it? Would it keep? Will receive 7 cents per quart for milk in winter and 6 in summer. J, A. S.
Ohio.

We would much rather undertake to haul the silage as needed in winter than attempt to fill a silo from a field of corn 12 miles away, unless one could command the services of a large number of teams and a small army of men. We should apprehend no injury to the silage by transferring it in winter, especially if kept well covered.

Painting a Silo Inside—Mouldy Silage.

I ask your advice in regard to the best and cheapest paint for painting a silo? Would coal tar or pitch be all right, and as cheap as any thing?

I began using the ensilage a few days ago, have used about 18 inches off the top. Forone foot or more, around the sides, the silage is quite mouldy. I fear I shall find it the same at the bottom of the silo. W. L. P.
Black Run, Ohio.

It is not considered necessary to paint the inside of a silo, as it prevents the wood from drying out and causes it to rot faster.

In some cases the wood has been given a coat of crude petroleum or gas tar thinned with gasoline, and those who have tried it report satisfactory results, but others have found it equally satisfactory to use bare wood.

Mouldy ensilage comes from putting too dry corn in the silo. The tendency of late years is to silo the corn riper than formerly, and an increase in mould seems to be the result. The trouble can be prevented, when dry corn is siloed, by giving it a thorough wetting, either when filling or when in the silo.

For a Couple of Pennsylvania Jerseys.

As I am somewhat new in the dairy business I would appreciate it highly if you would advise me as to how to obtain better results than I am now securing from 2 Jersey cows—one weighing 800 and the other 950 pounds. I feed them all the cut corn fodder they will eat up clean. For grain I feed 3 times a day the following, at each feed adding a teaspoonful of salt: 1¼ lbs. corn meal, 2 lbs. wheat bran, 1½ lbs. gluten meal. I moisten this with a little water, and on cold mornings I use warm water. From the smaller cow I am getting 23 lbs. of milk, and from the larger 26 lbs. per day. These cows were both fresh in September. Corn is worth $24 per ton; bran, $23; gluten meal, $28; buckwheat middlings, $24.
Franklin, Pa, J. L. H,

We are not at all certain that these cows are not now doing first-class work, but this cannot be determined without knowing the quality of the milk. If this milk contains, as it probably does, 5 per cent of fat, the smaller cow is yielding at the rate of 1⅓ lbs. butter per day, and the other nearly 1⅔ lbs. We are also at a loss to understand whether each cow received the amount of grain (14¼ lbs.) specified or whether this amount suffices for both. And what is their "corn fodder?" Probably it is corn stover, that is, the whole plant, after removing the ears, and if such is the fact, we see no reason why a daily allowance of 5 lbs. bran, 2 lbs. gluten meal and 2 lbs. buckwheat middlings, with corn stover *ad libitum*, should not suffice. We would feed this grain without wetting, and preferably half in the morning and half at night.

Corn and Cow Peas for the Silo.

Will you kindly tell me through your valuable paper whether or not cow peas can be grown and harvested with corn for the silo, work to be done with corn harvester? If so, how and when to plant? H. W. B.
Collamer, Pa.

We have had a number of reports where corn and cow peas were grown for the silo with good results. Following is the method given by a correspondent:

A 20-acre field lying in and on the slopes of the valley, was well broken and prepared, and the corn planted the middle of May without fertilizer. The corn, a large Southern variety, was put in with a one-horse drill, in rows 4½ feet apart and from 9 to 16 inches apart in the row. This width of row was given to admit plenty of sunshine and air. After the first cultivation and during the first days of June, when the corn was about 6 inches high, the peas were planted between the corn and in the same row with the corn, with a hand planter, commonly used for replanting purposes. The delay in planting the peas is deemed necessary to give the corn a good start ahead of the peas, the latter being of more rapid growth. If the corn rows are straight the peas may be put in more expeditiously with the one-horse drill, if care is taken to keep the same close up to the corn row; the object being to have both crops grow so as to be harvested together with the corn harvester, and bound into bundles, without waste, ready for the wagons.

Pasteurizing Cream on a Small Scale.

Would you please inform me how to make pasteurized cream on a small scale, or without a pasteurizer. E. N. G.
New Philadelphia, Ohio.

On a small scale cream can be pasteurized by setting the cream can in a can of hot water and keeping it there with constant stirring until the cream is heated to 148° F. The cream should be held at that temperature for 20 minutes and then cooled as quickly as possible by placing the cream in a tank of cold water stirring the cream constantly until it is down to 50° F. The great trouble in pasteurizing small quantities of cream by this method is the liability of a cooked flavor in the cream, to prevent which the cream must be heated to the above temperature as soon as possible and rapidly cooled.

How Much Milk Should a Heifer Yield?

How many pounds of milk ought a heifer with 1st calf give, to promise being a good cow? J. L. C.
Elmer, N. J.

Quantity of milk yielded is not sufficient to determine a question of this character. Quality is equally important. A two-year-old heifer yielding three-fourths of a pound of butter or more, daily, should be considered as promising to become a profitable dairy cow.

How Many Cows for a Silo.

I have a farm of 60 acres and the soil is mostly gravel, with sand and gravel subsoil. Have been unable to keep more than 8 cows and two horses. I had thought from what I had read, that I could keep more cows by building a silo, but your answer to L. B, Q., Milton, Or., page 874, where you say that it is doubtful if a silo would be profitable, where one has less than ten or fifteen cows, has rather discouraged me. Do you think it would pay me to build one?
Pulaski, N. Y. J. J. T.

"Circumstances alter cases." What might not be advisable for a dairyman in the far west, might be eminently practicable for one in New York, and *vice versa*. However, we still adhere to the proposition that unless one is situated in a community where he can hire the power and machinery for filling a silo, it would not be expedient to build a silo for less than 10 or 15 cows.

In the case of this inquirer, we suggest that, for the present at least, he put a little extra effort into improvement of the soil. Make a trial of alfalfa on a small scale, get more humus into the soil, add to the culture, save *all* the manure, *liquid* as well as solid, grow more clover, and by these means make the farm capable of carrying 15 or 20 cows.

Stalls or Stanchions.

I wish to know your opinion of stalls for confining cows in, as compared with stanchions. Can they be kept clean in stalls? Is there any serious disadvantage in them? If practical can you give me your idea of how they should be constructed? A. L. D.
Norwich.

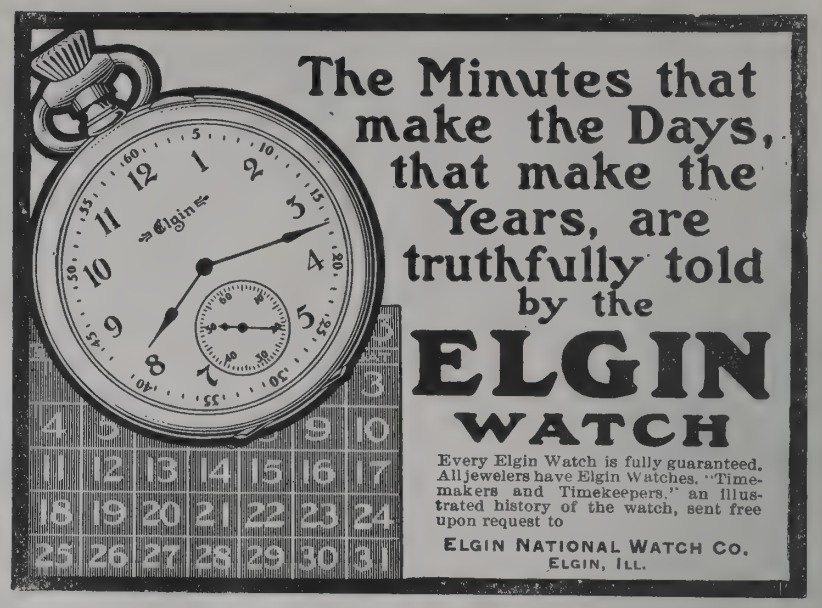
We are decidedly of the opinion that any form of tie or stall is much to be preferred to the old-time, rigid stanchion, but it would be sheer arrogance for us to attempt to say which one of the many devices on the market or in use is to be preferred. Consult our advertising columns, write to the advertisers, get their circulars and illustrations, give all the points careful study and then make your choice.

A Pennsylvania Ration.

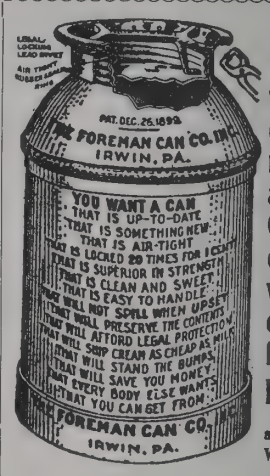
Please give me a balanced ration for milch cows from following: Wheat bran, $20 per ton; corn meal, $22; oil meal, $26; mixed hay and cured corn, well eared, intended for silage, but could not get it cut and put in silo. L. R. S.
Corydon, Pa.

Depending altogether upon the present ability of the several cows in the herd to respond, we should expect the following to offer a satisfactory average daily allowance: 10 lbs. corn fodder, 12 lbs. mixed hay, 4 lbs. bran, 2 lbs. oil meal.

What Feed (Concentrates) to Purchase.



What will be the most profitable grain and how much to feed, with corn fodder, not stover, and bright oat straw. Also with clover hay and oat straw. I will have to buy all the grain but oats. L, J. C.
Memphis, N. Y.



Corn fodder and oat straw are highly carbonaceous feeds and call for concentrates rich in protein, such as gluten feed and meal, brewers grains, linseed oil meal, cotton seed meal, bran, etc. Without information as to ruling market prices, it is impracticable to select. With clover hay replacing the corn fodder one would need less protein in the grain.

Note and Comment.

Ohio Weather—Milk Prices—Winter Feed—How Rations are Used by Cows—The Hegelund Method of Milking—A Defect in Milking Machines—The Cross Bred Steer at Chicago—The Hired Man Question.

ED. HOARD'S DAIRYMAN:—Despite the facts set forth by "Uncle Zeek" that 'twas going to be a mild, open winter, 'cause the coons and ground hogs carried no beddin inter their holes, the corn blades wos thin, the shotes were carryin' no extra hair, and the state majority wos the biggest ever known," we have had as steady cold, and no let up winter since

We wish to announce that we are now operating our new factory at Irwin, Pa. Capacity 1000 cans daily, which should enable us to fill all orders promptly.

Cancer Cured by Anointing with Oil.

A combination of soothing and balmy oils has been discovered which readily cure all forms of cancer and tumor. It is safe and sure and may be used at home without pain or disfigurement. Readers should write for free book to the originators, whose home office address is Dr. D. M. Bye Co., Drawer 505, Indianapolis, Ind.

the 22nd of November, as was ever known in this vicinity, and keeps on getting steadier all the time. It looks now as if Wm. Skinner would have little trouble in getting his August and September cut hay eaten, as he notes that "in snapping cold weather cows take hold of most any sort of hay."

With snow storms without number, they have been merely bluffs, and not three inches of snow in all has fallen in this vicinity, but the icy condition of the roads is something never before experienced, and now continued for over three weeks. Ice not only covers the road, but the lots as well, and any driving or farm work is done at much peril, and the most strenuous advocates of every day drawing of manure are not attempting it; in fact, they are doing pretty well to get the milk to the station and cans home, with whole bones.

The milk prices have not reached the expected point hoped for. The creameries are paying $1.20 per 100, and the city trade pays $1.14 for 85 pounds, out of which comes 15 cents a can for "baggage rates," as milk here goes as baggage and not as freight. Feeds are not as high as last winter as yet, and fully two-thirds of the grain fed hereabouts is farm-grown, which makes that part of the ration nearer cost, and the other fact that the silage corn made a great September growth, and the surprising amount of fine hay put up, if late grown and the second crop abundant, the real cost of the ration is not as much as last year, and so profits, I think, will not be greatly different.

The quality of the silage, so far as I have seen, is very fine, and its feeding value No. 1, and as there are something like 1,000 silos in the fifteen adjoining townships, it is not too much to venture the assertion that they are likely to become popular before so very long.

***

I was greatly interested in the reported remarks of Prof. Jordan at the recent normal institute, about the use and waste of the rations fed to cows; that a cow only uses one-third of her food for milk, all the rest goes to heat and energy—work; and that the more an animal has to chew and work to masticate food and digest it, the less it can give back in profit. Much less energy is returned from a ration of dried corn fodder than from the same food fed green, and it would seem the contention of the men who advocate the close housing of winter milkers is justified, when the professor says: "A warm stable with slight exercise, reduces the need of large rations, hence reduces cost, and increases profits," and confirms another opinion that some of us hold, that a grain ration of not over eight pounds for a cow, daily, is sufficient, a few individual cows excepted, and to feed more is unprofitable. But I am a little mystified a little farther along where it is mentioned that few, even of the better class of dairymen feed liberally enough to reap the fullest reward. I would like to know what a liberal feed would be. I had supposed that for cows standing in a warm stable, water at will, 50 pounds of No. 1 silage, and 6 pounds of fine clover hay and 6 pounds of best mixed grain, was about all a cow of average size would eat, and if that is not liberal feeding, please drop us a line and we will either add to the feed or take another clip off from the exercise.

***

And now it is Cornell that has been investigating the Hegelund plan of milking to increase the milk yield, by kneading, squeezing and manipulating the udder in place of the usual so-called stripping to get the last wrung drop of milk, and the possibility of this manipulation inducing nature to give down a little more; but I notice that the report is that the advantage of the Hegelund system over clean stripping remains to be proven. It is true that there is much bad milking and indifferent drawing of the last milk from the udder, but we opine that there will be little bettering of the plan of finishing of milking with one hand, and with the other reach up and press towards the milking hand and so get the last few streams. There are a few cows that seem to rapidly secrete a little more milk within a few minutes after milking, no matter how well one strips, but they are exceptions. We recall one of our best cows that five minutes after milking her, we could draw forty full streams of milk, but there would be no second filling of the milk cisterns.

This clean milking, complete drawing, seems to be the failure in the good work of some of the milking machines. Sometime since I saw one of the best of the milking machines at work, and to get all of the milk, the operator either had to hand strip, or else practice the Hegelund method, and help out the machine, for strip it would not. So far as I am informed, all the milking machines are defective in securing the strippings, and it is in getting them well and complete, that has a large part in maintainance of the milk flow. It is worth a generous vote of return thanks to the Station men, who are trying to help the farmers get more out of a cow, even if some of the claims they seek to investigate, "are not proven."

***

Of course that mixed-bred steer "Challenger" at the Chicago show, is cropping out in dairy circles to wit—that if a mixed-bred steer are the best animal in the show, why then is not the mixed bred cows the best in the dairy? Well Challenger was an exception, and his like never before made its appearance. He was a sort of a freak-like Jumbo and to base any fast and fixed conclusions on him as a guide in other cases or line of proceedure, is sure to come to grief. While there are many traditions about the great preformance of some long gone "old Brock," or "Brindle," the records show that no grand prize has gone to a mixed-bred cow or dairies, in competition with straight-bred ones, and all of the phenomenal cows have been pure bred. This is not saying that all pure-bred cows are profitable dairy producers, and it remains to be seen if the men who compete for the champion steer prize next year at Chicago will select four breed-mixed steers to try to win the chief honor. It is much the same with cows as with hogs. When one wants the best, and winners, illustrated by what wise old Theodore Louis once said, "Oh, yes, the first cross-bred hog is often a good one, but if you mix them a second time, you are out of a hog, and must go back and buy pure-bred ones to start again."

***

The hired man problem which is being discussed with so much practical intelligence in the DAIRYMAN, is very interesting reading, but if this information was preceded by a formula for catching, and holding a hired man, it would be gratefully received by a lot of us hereabout, who are forced into every kind of make-shift to get work done, owing to the almost absolute disappearance of labor that will consent to work on the farm at any wages within reason. Carl Schurz in last McClures' in discussing the race problem of the South, and the "disinclination of the negro to work on the plantation if educated," says the same thing is true in the North; the white boy refusing to walk behind the plow, or milk the cows, because of the solitude of farm life. The desire to go to the city and enjoy a pleasanter existence, to do finer work with little labor, which is observed everywhere in the North with so much anxiety, is not different from the desire of the southern darkey, and is largely attributable to the natural effects of popular education.

Is this a defensible reason for the restriction of a wider, broader education for the youth of the United States? Must we burn the school house to keep the boys on the farm. It was said that when the trolley, telephone, rural delivery, and the centralized school came to the farm and abolished its isolation and solitude, that the farm would claim its rightful own, but it has done nothing of the kind, and the hired man has gone in the crowd with the young men to the city, and beyond, and one cannot educate one, until he can get him, and hold him fast by some means, for a while, but how to keep him for a series of years, has as yet been unexplained, from the lookout of the man in Northern Ohio, whatever may be the outlook in other sections. It's easy to harrow corn, but you must first have a field of it to harrow.

Ohio. JOHN GOULD.

HAS DAIRY EDUCATION PAID IN MINNESOTA?

Dairy Commissioner McConnell of the State of Minnesota makes the statement drawn from careful investigation that the butter production of that State has increased in the past twelve years more than 100 per cent per cow. This would have never happened without the constant agitation of the minds of the Minnesota farmers on this dairy subject.

MORE MILK FOR YOU

International Stock Food Co., Minneapolis. MARION, IOWA.

DEAR SIRS:—I have used several kinds of stock foods during the past few years, but have never fed any equal to **"International Stock Food."** I have been feeding it to my milk cows for the past six months with the most gratifying results. It not only keeps the cows in a healthy condition, but greatly increases the quality as well as the quantity of milk. Its effects are unequaled in removing any irregularities at calving time, and its use before and after calving I consider a great benefit. As an appetizer, blood purifier and general tonic, I consider it to be all you claim, and the best I have ever used.

HENRY L. ALLEN, Proprietor of South Side Dairy.

☞We Have Hundreds of Thousands of Similar Testimonials and Will Pay You $1000 Cash to Prove That They Are Not Genuine.☜

We own **"International Stock Food Farm,"** which is located 12 miles from Minneapolis and contains 650 acres. We feed **"International Stock Food"** every day to all our WORLD CHAMPION STALLIONS, DAN PATCH 1:56¼, DIRECTUM 2:05¼ and Roy Wilkes 2:06½; and also to our YOUNG STALLIONS, BROOD MARES, COLTS, WORK HORSES, CATTLE and HOGS. **"INTERNATIONAL STOCK FOOD" 2 FEEDS FOR ONE CENT** is Prepared from Roots, Herbs, Seeds and Barks and Won the Highest Medal at Paris Exposition in 1900 as a High-Class vegetable, medicinal preparation to be fed to stock in small amounts as an addition to the regular feed. It is a Great Aid in Growing or Fattening stock because it increases the appetite, Aids Digestion and Assimilation so that each animal obtains more nutrition from the grain eaten. We positively guarantee that its use will make you extra money over the usual Plan of Growing and Fattening stock. **"International Stock Food"** can be fed in safety to Horses, Cattle, Sheep, Goats, Hogs, Colts, Calves, Lambs or Pigs. It will make your Calves, Colts or Pigs grow amazingly and will keep them healthy. It is Absolutely Harmless even if taken into the Human System. You insist on eating the following medicinal ingredients with your Own food at every meal: Table Salt is a stomach tonic and worm medicine, Table Pepper is a powerful stimulating tonic, Table Mustard is a remedy for dyspepsia, Table Vinegar is a diuretic. You eat these medicinal ingredients almost with every mouthful of your food, and it is proven that these medicines promote health and strength for people and improve their digestion. **"International Stock Food"** contains pure vegetable medicinal ingredients that are just as safe and as necessary an addition to the regular feed of your stock if you desire to keep them in the best possible condition. **"International Stock Food"** is endorsed by Every High-Class Farm Paper and Over One Million Progressive Farmers and Stockmen. It purifies the blood, stimulates and permanently strengthens the entire system so that disease is prevented or cured. **"International Stock Food" is sold on a "Spot Cash Guarantee" by Sixty-five Thousand Dealers throughout the World, and has the Largest Sale ever known.** ☞Your Money will be Promptly Refunded in Any case of failure. We Refer You To Any Bank Or Wholesale House In Minneapolis. ☞Beware of the many Cheap and Inferior Imitations now on the market! No Chemist can separate and name all the Different powdered Roots, Herbs, Barks and Seeds that we use in our preparations. Any Chemist or Manufacturer claiming to do so Must be an Ignoramus or a Falsifier. Imitations Are Always Inferior. Insist On Having The Genuine And You Will Always Obtain Paying Results.

The Modern Hog as an Adjunct to the Dairy.

Synopsis of an Address by Mr. Andrew Elliott af Galt, Ontario, at Farmers' Institute at Bainbridge, N. Y.

"I have," said Mr. Elliott in opening, "been surprised to find the low price of land in this valley. For with us in Canada this same grade of land is held at a much higher price, and still we are able to so manage our farms as to make them return a good profit.

"I cannot understand how it is that with you here there is so much complaint of lack of profitable returns from your farms, but I believe it is in part because you have too few strings to your bow, or in other words, too little diversity in your farm productions.

"I want to have more than one string to my bow. I grow sheep, I feed bullocks, I keep some dairy cows, and I grow bacon. I find the sheep very profitable, and I believe you can grow them with profit also here.

"The only way in which we can increase or advance perceptibly the price of any product, is by increasing the quality. This we in Canada have learned to do in some directions at least. The best Canadian bacon to-day, i. e., that of the best quality, does not come into competition with your American bacon here at all. We have learned that to produce the best bacon we have got to get away from the thick, fat hog that is nearly all fat.

"The best bacon in the English markets is the Wiltshire bacon, and we in Canada have learned to grow that bacon. Last year we not only built up a large home trade in bacon, but we exported some fifteen million dollars worth.

"There are only two strictly bacon types of hogs, the large Yorkshire and the Tamworth. The fat in an ideal bacon must be evenly distributed, and the under cut must be as nearly as possible the same thickness as the upper cut.

Now as to how these bacon hogs are produced: I want to begin to breed my bacon hogs before they are born. I want to have the dam right. I want her right in the top, of medium size, of good length, as nearly even on top as possible, and with a light shoulder.

"I allow my sows to drop their first litter when a year old and after that breed two litters a year.

"The sire I want of much the same type as the dam only that he will be heavier in the shoulder and of a somewhat coarser organization. Feed the dam liberally, pasturing on alfalfa or rape, and in winter give an abundance of succulent food in some form. You can not do anything successfully with the hog unless kept clean and comfortable. The hog is naturally the cleanliest animal on the farm, and if given a chance will keep himself clean. No hog, if properly kept, will ever soil his own nest or bed room. His disposition to wallow in the mire is only because that is Nature's way provided for ridding himself of vermin.

"The pig pen must be warm and comfortable to secure profitable results. I want to have a cement floor and cement or iron troughs, the floor being so graded that the moisture will all run out to the outside and disappear. Then as to the light, I want good light, a window in each pen. You may say a cement floor is cold, but it is not cold as compared with a wet plank floor. I want an upstairs sleeping room for my pigs with a cleated platform for the pigs to ascend and descend.

I feed largely on clover hay and roots, the latter being mainly of turnips. In feeding these I pulp them and mix up with meal, letting them stand twenty-four hours before feeding. During the winter I feed them all the roots they will eat, but when it comes toward the time for finishing off we use a larger proportion of meal in the feed. Never put any water with this mixture of feed, but whatever water you give them give separately. We feed charcoal largely as a corrective of stomach troubles and a little sulphur added to the feed occasionally will be found beneficial. Never allow any parasites upon the hog, as the injury they will thus suffer is a loss you cannot afford. I spray the hogs and their nests with kerosene emulsion as a preventive of these and find it an unfailing remedy."

E. J. BROWNELL.

List of Tests Accepted for Record by the American Jersey Cattle Club, Dec. 30, 1903.

AUTHENTICATED FAT ESTIMATES.

Signora Bruce 154547—Sire, Harry B. Gordon 47246; dam, Janet Bruce 100862. Fat, 12.288 lbs.; milk, 250 lbs, Test made from Oct. 7 to 13, '03; age,

Did You Ever Keep a Record Of Your Cows?

IF SO, you have felt the need of a convenient, simple and handy Record Sheet. We have had so many requests for these Record Sheets that we concluded to get up one that would "fill the long felt want."

DAILY MILK RECORD SHEET FOR TEN COWS

We have a very simple and complete Record Sheet for 10 cows, one month, that is printed on heavy Manilla Paper, we can send postpaid at the following prices:

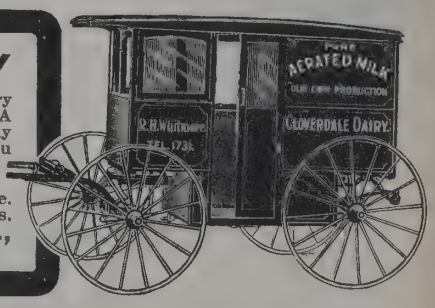
Price 5c Each	6 for 20c	12 for 30c	25 for 50c

SIZE 10x16 INCHES

We also have a one cow Record Sheet, heavy Manilla paper (one month) that we will mail postpaid

Single Copy 5c	5 for 15c	10 for 25c	25 for 40c

SIZE 6x15 INCHES



HOARD'S DAIRYMAN.
FORT ATKINSON, WIS.

A GOOD DAIRY

is known by the appearance of its delivery wagons as well as the quality of its milk. A bright, neat wagon, such as we can supply you, is the best possible advertisement you can use. Our reputation for building fine wagons extends over twenty-five years.

You should send today for our catalogue. It contains illustrations and full descriptions.

KOENIG & LUHRS WAGON CO.,
QUINCY, ILLINOIS.

IT PAYS TO DEHORN. Hornless cows give more milk. Hornless steers make better beef.
The best dehorner, the most humane and easiest to use is the **Keystone Dehorning Knife**
Cuts on four sides at once, without crushing or bruising. Highest award at world's fair.
Orders with cash filled from Chicago if desired. Send for circulars. M. T. PHILLIPS, Box 13, POMEROY, PA.

3 years, 10 months; estimated weight ——; fed 5 quarts ground barley twice daily; alfalfa hay *ad libitum*, twice daily.

PRIVATE BUTTER—TESTS.

Dansker's Griselda 157858—Sire, Dansker 49535; dam, Earl's Gazette 146213. Butter, 15lbs., 6 oz.; milk, 211 lbs., 14 oz. Test made from Nov. 24 to 30, 1903; age, 3 years; estimated weight, 700 lbs.; fed 4 quarts gluten feed and 4 quarts brewers' grains, daily; clover hay *ad libitum*.

Pansy Darling of Lawn 2d 147916—Sire, Applause 34234; dam, Pansy Darling of Lawn 76637. Butter, 15 lbs. 2 oz.; milk, 204 lbs., 13 oz. Test made from Dec. 7 to 13, 1903; age, 4 years, 5 months; estimated weight, 800 lbs.; fed 7½ lbs. wheat bran, 7½ lbs. corn and oat chop, and 2 lbs. cotton seed, daily, prairie and sorghum hay.

Nancy O'Neil 147723—Twenty-eight days. Sire, Carlyle Boy 36237; dam, Lizzie Blythe 90055. Butter, 59 lbs., 6 oz. in 28 days; milk, 1,115 lbs., 10 oz. Test made from March 28 to April 24, 1903; age, 6 years, 5 months; estimated weight, 800 lbs.; fed 8 lbs. bran, daily, green alfalfa *ad libitum* during six hours per day; no pasture.

CONFIRMED BUTTER TEST.

Oonan 17th of Hood Farm 152433—Sire, Hood Farm Pogis 40684; dam, Oonan's Landseer Wax 88400. Milk, 282 lbs., 11 oz.; fat, 13.467 lbs.; estimated butter on basis of 85 per cent fat, 15.844 lbs. Fat lost in skim milk, butter milk and samples, .147 lb.; fat available for butter, 13.320 lbs.; churned butter, 15 lbs., 10 oz. Percentage of fat churned butter, 81.99. Churned butter computed on basis of 85 per cent fat. 15 lbs. 1.2 oz. Test made from May 17 to 23, 1903. Age, 4 years, 10 months. Actual weight, 800 lbs. Property of C. I. Hood, Lowell, Mass.

CONCERNING OUR ADVERTISERS.

10,000 PLANTS FOR 16c.

This is a remarkable offer the John A. Salzer Seed Co., La Crosse, Wis., makes. They will send you their big plant and seed catalog, together with enough seed to grow 1,000 fine, solid cabbages, 2,000 delicious carrots, 2,000 blanching, nutty celery, 2,000 rich, butter lettuce, 1,000 splendid onions, 1,000 rare, luscious radishes, 1,000 gloriously brilliant flowers. All for but 16c postage, providing you will return this notice, and if you will send them 20c in postage, they will add to the above a package of the famous Berliner cauliflower.

What better offer could a dairyman want or could in fairness ask for, than the proposition of the Witte Iron Works, 531 W. 5th St., Kansas City, Mo. They will sell you a gasoline engine and give you a thirty days' free trial, and if it is not satisfactory, take it off your hands. Write them for full particulars of this offer and mention HOARD'S DAIRYMAN.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—On the Elgin Board of Trade to-day butter ruled firm at 24 cents. There were no offerings or sales.

Cheese—Receipts, 3,591 pkgs; quiet; state full cream, fancy, small, colored, September, 12c; late made, 10c; small, white, 12c; late made. 10c; large, colored, September, 12c; late made, 10c; large, white September. 12c; late made, 10c.

Eggs—Receipts, 3442 pkgs; strong: state and Pennsylvania, nearby, average finest, 39c; state and Pennsylvania, seconds to firsts, 33@39c; western firsts, 37c; western seconds 33@35c; refrigerated, 29@32c.

NEW YORK MARKET.

NEW YORK, Jan. 2—Butter—Receipts for the week, 22,777 packages. Exports for the week, 1,800 packages.

Arrivals continue to fall off and fancy fresh Creamery butter is firm and half cent pound higher than last week. All fresh made table butter had more inquiry at trifle higher prices. We note some out-of-city business in June Creameries with sales of lots of 50 to 100 tubs at 20@20½c and 21c, and best marks of Freezer goods are firm at 21c.' Under grades of June Creamery in full supply and freely offered at easier prices. We quote:

Creamery, fresh, extra, 25½c; medium, 20@23c; poor, 16@18c; creamery, June extra, 21c; medium, 19@20c; poor, 15@18c; Dairy, extra, 20@22c; medium, 17@19c, poor, 14@15c; Ladle, extras, 17@18c; medium, 14@15c; poor, 12@13c; Renovated, extras, 19c; medium, 17@18c: poor, 12@13c.

Cheese—Receipts for the week, 11,326 boxes. Exports for the week, 3,356 boxes.

It is the end of the year and the whole trade is busy stock taking and no business was doing in top qualities. Some small purchases by exporters of under grades Full Cream and Skimmed Cheese at irregular prices. We quote:

Full cream, extra 12c; medium, 10@11½c; poor, 8@9c Part skimmed, extra, 9c: medium, 5@8c; poor, 2@4c; Skimmed cheese, extras, medium, poor, 2@3c.

Eggs—Receipts for the week, 20,197 cases.

Strictly fresh stock is very scarce and prices are in sellers favor. Sales reported at 40c per doz. Ice House stock is about cleared up, with odds and ends selling at 28 to 30c.

177 Chambers St. DAVID W. LEWIS & Co.

BALTIMORE MARKET.

BALTIMORE, Dec 31.—Butter—Since our last issue the receipts of creamery have been very light, especially extras; hence, firsts and good seconds have been in better request. Owing to the light supply of fresh table grades, there has been a fair demand for fancy held creamery. Fine imitation creamery meets ready sale. Fresh ladles are also in fairly good demand; but held stock is plentiful and slow sale. Rolls, when the quality is passable, meet with a good reception: but cheesy stock is slighted. Packing stock continues in ample supply and moderate demand. Blocks and prints, when of desirable quality, meet prompt sale. Steady, but quiet, about describes the general condition of our market.

Creamery separator, extras, 24@24½c; firsts, 22@23c; seconds, 19@21c: Held creamery, extra, 22c; firsts, 20@21c; seconds, 17@19; imitation creamery, extras, 20c; firsts, 18@19c; seconds, 15@16c; Iowa & N. W, Ladle, extras 16½c.; firsts, 15@15½c; seconds, 13@14c; Ohio & Indiana Ladle, extras, 16c; firsts, 15c; seconds, 13@14c: Roll, Ohio, extras, 16@17c; firsts, 15c; seconds, 13@14c; Roll, W. Va., extras, 16c; firsts, 15c; seconds, 13@14c; Ohio Storepacked, firsts, 14c; seconds, 12@13c; W. Va. Storepacked, firsts, 14c; seconds, 12@13c; Creamery blocks (2 lbs.) extras, 26@26½c; firsts, 25@25½c; seconds, 23@24c. Creamery prints, (½ lb.), extra, 27c; firsts, 25@26c; seconds, 23@24c; Md, Va. & Penna. prints, extras, 25@26c; firsts, 23@24c; seconds, 18@22c. Renovated butter, extras, 19c; firsts, 18c; seconds, 16@17c.

Cheese—Quotations given are for late made October cheese. Fancy Septembers are bringing a full cent a pound higher.

N. Y. State Cheddars, fine, 10½@11c; choice, 9¾@10c; fair, 9@9¼c; do Flats, fine, 11@11½c; choice, 10½@10¾c; fair, 9½@10c; do Small, fine, 11½@12c; choice, 10¾@11c; fair, 10@10¼c; Ohio Flats, fine, 10@10½c; choice, 9@9¾c; fair, 8½@9c; Ohio Picnic, fine, 10½@11c; choice, 10@10¼c; fair, 9¼@9¾c; Skims, fine, 8@8½c; choice, 7@7½c; fair, 4@6c; Swiss (Domestic) new, fine, 14½@15c; choice. 13@13½c; fair, 10@12c.

Eggs—With the receipts very light for the past few days, and the accumulations of last week pretty well cleaned up, the market generally presents a much healthier appearance and closes firm at 34 cents on all desirable stock, either fresh or storage. G. M. LAMB & BROS.

GIVES PROMISE OF GREAT PROSPERITY AMONG CREAMERYMEN AND DAIRYMEN

Every creamery in the country should be equipped with

DE LAVAL CREAM SEPARATORS

for factory use or arrange to place the

DE LAVAL FARM SEPARATORS

with all their patrons.

The wisdom of this course will be apparent at the year's end, when largely increased profits for both creamery and patrons will be in evidence, as is invariably the case where the DE LAVAL machines are used.

For Sale—A high grade Guernsey heifer 15 months old, sired by Espanore 2nd, of Mr. W. D. Hoard's herd. Price $25.00. Address E. S. CURTIS, care Hoard's Dairyman, Fort Atkinson, Wis. 48-2

For Sale—Five registered Jersey heifers. Good ones. W. T. HARBISON, Plattsburg, Mo. 48-2

Mr. Wheaton's Canadian Dairy Notes.

The Better Curing of Cheese—Some of the Results Obtained.

ED. HOARD'S DAIRYMAN:—Among the important subjects to be discussed at the January dairy conventions will be that of the better curing of cheese. This is not a new topic. It has been on the programs of the dairymen's annual gatherings for the past few years.

While its discussion has resulted in some improvement and a desire on the part of factory owners to provide better equipment in this direction, a large amount of work needs to be done yet, before anything like ideal conditions are reached. It takes time and a lot of persuasive eloquence to bring about any decidedly forward movement in this line. Besides, the average dairyman requires more than mere eloquence or general advice on the subject before he will move. He must have proof that it is the right thing to do; and more, that it will put money in his pocket and insure a greater return on his investment.

But proof of the value of better curing facilities, is not wanting. Experiments both at Guelph and those conducted by the Dairy Division at Ottawa furnish ample proof of the need and value of controlling the temperature in curing and also of curing at a much lower temperature than is the custom in the average curing-room. And still progress has been slow. Much proof and much persuasiveness are yet necessary before our factories are equipped as they should be with proper curing facilities.

The most comprehensive work in this direction has been conducted by the Dominion Dairy Division. As the readers of the DAIRYMAN know, four consolidated cool curing stations were established by this Division in the spring of 1902. During the season of 1902 and 1903 over 70,000 cheese from some forty factories have been cured at these stations.

As the cheese were collected from the factories, a number from the same vat from all factories were set aside each week, and after being weighed, one was placed in the curing-room and the mate to it in the upper story where the temperature was not controlled. When the cheese of the corresponding week were sold these cheese were again weighed, and the difference in shrinkage noted. From this difference the saving in shrinkage on the whole lot was calculated.

The saving in shrinkage on all the cheese so handled this season up to date is as follows:

STATION	Number of cheese	Shipped weight	Shrinkage saved, lbs.	Value
Brockville	9,536	761,599	9,869	$1,911.39
Cowansville ..	14,080	1,137,159	13,694	1,497.44
St. Hyacinthe	9,255	711,076	6,816	699.76
Woodstock	12,898	1,013,562	14,410	1,461.17
Totals.	45,769	3,623,396	44,609	$4,669.76

To do a little figuring: The total saving or $4,669.76 represents the interest at 6 per cent or over $75,000, or what would provide a capital outlay of nearly $2,000 for each of the forty factories concerned. The past season has been a remarkably cool one and moist as well. In an ordinary season the shrinkage would be very much greater. A high temperature and a dry atmosphere are the two conditions that increase shrinkage in cheese.

But the saving in shrinkage, as shown above, is not the only advantage; an important one is the improvement in quality At the various stations the cheese cured under the different conditions have been examined time and again by cheese buyers, cheese makers and other experts, and in every case the cool cured cheese has been pronounced the best in quality.

A high temperature makes the texture of the cheese rough and mealy, and where the temperature is extremely high a greasiness is produced that is very undesirable. The whole effect is to destroy that silkiness of texture, that is so desirable in the finest quality of cheese.

Then, bad flavors are always intensified by high temperatures. In the station work many cheese have gone "off" flavor at the higher temperatures, while their mates that were cool cured, remained sound and clean. A high temperature produces a sharp or "tasty" cheese much quicker than a lower one.

While it is not claimed that the cool curing will make a fine cheese out of a poorly made one, still, cheese that are a little weak and open, or on the other hand have a little too much acid, show up better when cool cured, than they do when cured at ordinary, hot weather temperatures.

Taking all these things into consideration it is hard to estimate the value to our great national industry by the general adoption of cool curing. Something may be learned from the experience of the past two seasons. The weather, as we have stated, has been cool and conditions for curing were, in the average factory, much better than usual. One result of this has been the largely increased demand for Canadian cheese in Great Britain, resulting in higher prices and better values for the milk producers.

But the weather cannot always be depended upon, and factorymen should so equip their factories as to be practically independent of it. Unless they do so, a hot season may put them back where they were two or three years ago. Let the forward movement begin now while our reputation for quality is so good.

Though the information we have at hand does not give it, it would be interesting to know just what extra value those buyers, who reported so favorably upon the quality of the cool-cured cheese at the Government stations, put upon the better article as compared with the inferior product. In other words, what is this improved quality worth on the market? The saving in shrinkage has been brought down to dollars and cents. Why cannot the improvement in quality also be figured out in the same way?

It is claimed that the greatest value of cool-curing is in the improvement in quality. If so, we may place the saving in this respect at least the same as that for shrinkage. This would make a grand total of $9339.52, which would represent at 6 per cent, a capital of over $150,000, or nearly $4,000 for each of the factories contributing cheese.

This increased value for quality is, however, the "sticker." The average cheese buyer will report upon a lot of experimental cheese, as in the case in point, and state that the cool-cured are of much better quality. But will he go right down in his pocket and pay more for them? If they are better they should be worth more money.

And it is just here where the inducement to improve on the part of the patron and factory owner usually receives a severe check. The buyer does not back up what he preaches. A dozen or more factories, good, bad and indifferent, will board cheese on the local market on the same day, and, with few exceptions, the buyer will bid practically the same price for the whole lot. If he discriminates at all it is so very slight that there is not sufficient inducement given to go ahead and make the very finest quality. There

KNOWS NOW

Doctor Was Fooled by His Own Case for a Time.

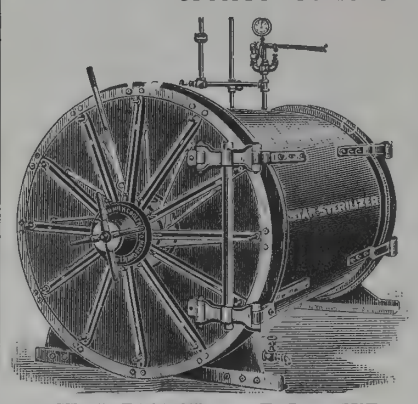
It's easy to understand how ordinary people get fooled by coffee when doctors themselves sometimes forget the facts.

A physician speaks of his own experience:

"I had used coffee for years and really did not exactly believe it was injuring me although I had palpitation of the heart every day.

"Finally one day a severe and almost fatal attack of heart trouble frightened me and I gave up both tea and coffee, using Postum instead and since that time I have had absolutely no heart palpitation except on one or two occasions when I tried a small quantity of coffee which caused severe irritation and proved to me I must let it alone.

"When we began using Postum it seemed weak—that was because we did not make it according to directions—but now we put a little bit of butter in the pot when boiling and allow the Postum to boil full 15 minutes which gives it the proper rich flavor and the deep brown color.



'I have advised a great many of my friends and patients to leave off coffee and drink Postum, in fact I daily give this advice." Name given by Postum Co., Battle Creek, Mich.

Many thousands of physicians use Postum in place of tea and coffee in their own homes and prescribe it to patients. "There's a reason."

A remarkable little book "The Road to Wellville" can be found in each pkg.

We're Here for Business

WHAT CAN WE DO FOR YOU?

STAR PRESSURE STERILIZER

Shall we fit up your dairy complete and turn it over in practical working order?

Are you in the market for bottles and caps?

Write us for information and prices. We want to do business with you.

Shall we supply you Milk and Cream Cooling, Bottle Filling, and Sterilizing Outfits?

Shall we furnish you with plans and specifications for Dairy Buildings?

Try our apparatus.

STAR MILK COOLER CO., Haddonfield, N. J.

DO YOU

Need a Friend?

We carry them in stock and can ship you one on short notice.

OUR IDEAL BOTTLE FILLER

Is made in two sizes, filling two or four jars at once. Just the thing for small and medium sized dairies and milk plants. We carry a complete line of Bottle Fillers, both large and small, and can meet the needs of every one.

Our Milk Dealers' Price List tells all about them, and is yours for the asking. We carry at all times a complete line of **Milk Dealers' Supplies,** and make prompt shipments. Try us.

Pasteurizing Apparatus, Low Down Milk Wagons, Ice Cream Supplies and Apparatus, Milk and Cream Signs, Milk Jars, etc., etc.

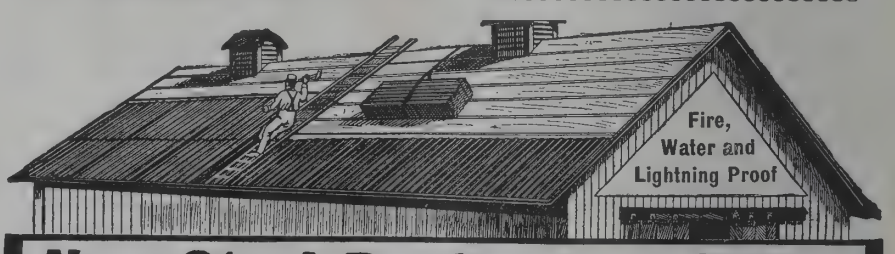
BRANCHES: Kansas City, Mo., Minneapolis, Minn.; Waterloo, Iowa; Omaha, Neb. St. Louis, Mo. and Cowansville, Quebec.

Do not Cool Your Milk



the old-fashioned way, with a dipper or a paddle, but get an up-to-date

Milk Cooler-Aerator.

Saves Time, Labor, Patience and Money.

A Booklet for the asking.

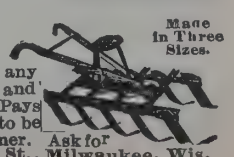
Champion Milk Cooler Co., 67 Main Street, CORTLAND, N. Y.

New Steel Roofing and Siding

Complete with nails and painted red on both sides at

$2.25 per 100 Square Feet.

Most durable and economical roof covering made for houses, stores, barns, sheds, cribs, poultry houses, etc., and a hundred other purposes for inside or outside use; cheaper and will last longer than any other covering. Sheets are 6 and 8 feet long.



We Pay the Freight

to all points east of the Mississippi and north of the Ohio River. (Prices to other points on application.) This roofing at $2.25 per square is our No. 10 grade, semi-hardened. Very easy to lay; requires no experience; hatchet or hammer the only tool needed. Comes in **Flat, Corrugated, V Crimped, Brick Siding and Beaded Ceiling or Siding.** Prices on application. **Send us your order to-day** for immediate shipment.

Write for our catalogue No. 20 on furniture, building materials, wire, pipe, plumbing materials and supplies of all kinds. **We buy at sheriffs' and receivers' sales.**

CHICAGO HOUSE WRECKING CO., 35th and Iron Sts., **Chicago.**

ICE CUTTING is easy with DORSCH ALL STEEL, DOUBLE-ROW ICE PLOWS. Marks and cuts two rows at a time; cuts any size cake and any depth, and does it with ease and economy. Does the work of 20 men sawing by hand. Pays for itself in two days. No farmer, dairyman, hotel man or other can afford to be without it. Have a supply of ice and enjoy the comforts of life in the Summer. Ask for catalogue and introductory prices. **JOHN DORSCH & SONS, 212 Wells St., Milwaukee, Wis.**

Made in Three Sizes.

is an improvement, however, in this direction, but not as much as there should be when the methods of an up-to-date factory and a poorly equipped one are taken into account.

In our opinion the buyers could do more good educational work in one season, than all our best instructors could do in ten years (and this is not disparaging the value of the instructors in the least) if they would discriminate as they should when buying the product. A loss of ¼ to ½ cent a pound on the cheese offered on the open market would soon bring many of our delinquent factories to time and cause a revolution in factory equipment and facilities for making and curing cheese. It is dollars and cents that count.

While the experiments at the cool curing stations have been far reaching and of inestimable value to the industry, they have not succeeded so far in inducing any group of factories to combine and erect central, cool-curing stations. One reason for this is the foolish petty jealousies that exist between individual factories and prevent them from co-operating. An extension of the co-operative system a notch or two higher would work wonders in improvement of quality. The factory syndicate system may help some in this direction after it has been in operation a few years.

The cool-curing system if taken up, as it likely will be, will probably work out in this way. The larger factories will make the necessary improvements in connection with their own buildings. A considerable portion of our cheese may in future be cured in the warehouses of the exporter or commission merchants. Some consolidated curing rooms, and we hope they will not be a few, as the patrons should control their own product as far as possible till it is finally disposed of, may be organized. The next few years will, however, show how the cool-curing idea will work out.

The annual meetings of cheese factories, which are usually held the first month of the year, will likely show a most successful year. One factory in Perth county paid out over $35,000 for milk supplied by its patrons during the season of 1903, or an average of nearly $220 to each of its 160 patrons. Similar and even higher records will likely be made. Records are likely to be established that it will keep many factories hustling to reach up to in the future.

Toronto, Can. J. W. WHEATON.

The Farmers' Course at the Wisconsin Agricultural College.

There are now more than five hundred students in the Agricultural course at the University. The shortest of these courses lasts twelve weeks and the next covers two terms of fourteen weeks each, while the longest lasts four years. One might think at first that we were in position to meet the necessities of all classes of people seeking or needing agricultural instruction, but such is hardly the case. There is a class of farmers in our state who, like other busy business men, can not leave home for any considerable period. These men are anxious to learn more about their business and are in position to gain much good from even a brief course of instruction at the University. Realizing this, the University authorities have decided to announce a special course in agriculture for busy farmers lasting from February 5th to February 18th, inclusive.

The annual meeting of the various agricultural societies is held at Madison February 2 to 4, 1904. The Farmers' Course will begin the day after these meetings close and continue two weeks. The railroads have most helpfully granted a fare and a third rate for all who come to one or both these gatherings. No person under twenty-five years of age will be admitted to this course.

Each day, instruction will begin at eight o'clock, there being two morning lectures which will take up the time until the ten o'clock hour is reached. Farmers will spend the remainder of the day in corn judging and in the stock judging rooms and stables at the University Farm with the several instructors. Professor Moore has secured a large number of samples of corn and will drill the students in corn judging. Each farmer is asked to bring ten ears of seed corn such as he will plant next spring for study and comparison.

It is believed that the college can accomplish a great deal of good in educating the farmers to appreciating a high type of pure-bred seed corn.

To aid in this course the University has employed a number of experts as follows:

Mr. C. G. Elliot, Expert in Drainage, U. S. Dept. of Agriculture, Washington, D. C., N. H. Gentry, breeder of Berkshire swine and judge of beef cattle, Sedalia, Mo., John G. Imboden, butcher and stock feeder, Decatur, Ill., John Splan the noted driver and light horse dealer, Chicago, Alexander Galbraith, importer of horses, Janesville, Wisconsin, H. C. Taylor, breeder and judge of dairy cattle, Orfordville, Wis., Geo. McKerrow, expert sheep judge, Supt. of Farmers' Institutes, Sussex, Wis. On the first evening of the course Gov. W. D. Hoard will address the class on the "Importance of Education for the Farmers." A number of farm animals will be slaughtered and instructions will be given on the carcasses and different cuts of meat, by Mr. Imboden. No fees will be charged to residents of the state; non-residents are charged ten dollars ($10.00) fees. Room and board will cost about $5 per week.

Farmers are urged to bring their wives with them, if possible, for there are many things that will attract and interest them about the university. While the farmers are busy with their work in lecture, laboratory and stock judging rooms, their wives can attend other university lectures, if they choose, some of which are of great popular interest. They can also visit the different university museums, the great historical library with its art collection, museum, etc. One can spend weeks in Madison employing every hour profitably and delightfully.

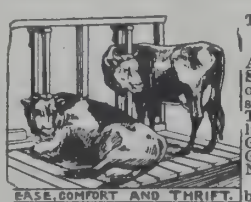
We will gladly send a "picture book" showing buildings, class instruction, etc., also a circular describing the Farmers' course to all who will send their address to the undersigned. W. A. HENRY,
Dean College of Agriculture.
Madison, Wis.

IS THE SILO PROFITABLE.

There are still a great many farmers who do not believe that it will pay to build a silo. They have arrived at this opinion not from experience, but from theory alone. Yet if you called these men "theorists" and not practical men they would be offended. Yet are they not theorists?

Prof. Otis of the Kansas Experiment Station, has been making some very careful experiments and calculations on this silo question. He finds that a field of corn that will yield ten tons of ensilage per acre, will return $32.90 per acre. This shows whether it pays to use the silo or not.

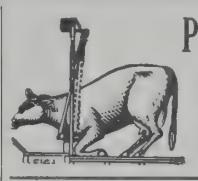
DON'T OVERLOOK



YOUR NEIGHBORS AND FRIENDS

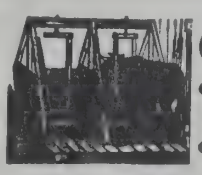
A good many of them would join you in a club for Hoard's Dairyman if you would speak to them about it. This favor will help them and help us greatly. Won't you do it?

WILDER'S PATENT SWING STANCHIONS
Chain or Pin Fastened.
Are self adjusting and noiseless. Fasten themselves open when animal is out; swing freely when latch is closed; opened and closed without removing mittens or gloves; keep cattle clean with most freedom of motion; blind bolted and cannot get loose in joints; made of best selected hardwood and furnished with chains or pins as desired.
Safest, Strongest, Most Convenient fastening made. Cheapest to put in and save room in barn. Send for Stanchion Catalog to
J. K. WILDER & SONS, BOX 11, MONROE, MICHIGAN.



The BEST Cattle Fastening.
SMITH'S Self-Adjusting Swing Stanchion. The only PRACTICAL swing stanchion invented. Thousands in use. Illustrated circular free. GLENORA MFG. CO. Glenora, Yates county, N. Y.
Infringements will be prosecuted.

Scott's "Perfect" Cow Stanchion
SWINGING
SELF-CLOSING
SELF-LOCKING
3 NECESSITIES FOR PERFECT STANCHIONS
Made of hard wood—strong and durable. Price $1.00. Satisfaction guaranteed.
Write for descriptive circular.
B. C. SCOTT, 212 Beach St., Bridgeport, Conn.



A Steel Stanchion beats anything you ever saw for tying cattle. Lighter, stronger, neater. Swings on chains Not in the way when lying down. Agents wanted. Write for special terms and prices. **Jas. Boyle, Mfr., Salem, O**

Prescott's Swinging Swivel tanchion
Keeps Cows Clean.
Swings forward while getting up or lying down. Looks back while standing. Full particulars free.
E. PRESCOTT,
Beverly St., Boston, Mass.

THE NEW PATENT
Cow Stall
AND FEED TROUGH.
This is the only Cow Stall with a centering hinge. Stalls all fold back to manger as the cows go out the barn. When ready for use, by starting one stall all come into position. No post at the gutter. Send for circulars.
R. A. McLERY & CO.,
Palmyra, Wis.

CHAIN-HANGING CATTLE STANCHION
The Most Practical CATTLE FASTENER ever invented.
Manufactured and For sale by
O. H. ROBERTSON,
Forestville, Conn.

JUST OUT! UNDERHILL SELF ADJUSTING STALL

No Gutters
No Platforms
No Fastenings
No Stables to clean
Cease trying to keep your cows clean. Give them a chance and they will do it themselves. This is the only way and the easy way. Write for circular.
Wm. M. UNDERHILL, Oconto, Wis.

WARRINER'S CHAIN HANGING STANCHION.
CLEAN, SAFE, COMFORTABLE.
MFG. BY W. B. CRUMB, Forestville, Conn.

ECONOMY Feed Box and Manger.
Saves its cost in one year's use Used and endorsed by leading stockmen Write at once for descriptive circular. State how many head you feed,

Cream reduced to 4% milk equals 3,106,372 lbs. milk. C. L. PASSMORE, Secretary.

Power for Separating and Churning.

ED. HOARD'S DAIRYMAN:—The interrogation of a Pennsylvania farmer in DAIRYMAN for Dec. 25, in relation to power for separating and churning, was advisedly answered by the editor.

Living in a section where dairying is the leading industry, and where the separator is almost exclusively employed, I would like to say a few words as to methods pursued here.

One-horse powers, of which there are those especially constructed for the purpose in this county, are largely used for separating and churning and have been for many years. They are used both with horses and bulls.

The powers are supplied with governers or self-acting brakes, which keep the speed uniform and at the desired rate, so there is no trouble on this account. These powers are largely used on the farms where the milk is separated and butter made.

There is, and has been for several years, quite a change in progress among the creameries and their patrons. Now, instead of the milk being carried to separator stations, it is separated on the farm by the small machines made for the purpose, and only the cream taken to the creameries to be made into butter. Where this is rightly managed, it is found to be an improvement on the old way of carrying the milk to the creamery or separator station, as will be readily understood by the patrons.

Many of these farm separators are run by hand, but this is quite a task, especially if there is considerable milk, and there is a demand for some kind of cheap and efficient power for this work. Where there is only the milk to separate, unless there is a large amount, a small power to be run by a dog or sheep, will be found to answer a good purpose.

A full rigged power of this kind should cost less than $25, and they are easily managed and durable. On our own farm we have one of this kind which is run by a Shropshire ram, weighing perhaps 200 pounds. He is kept in the barn all of the time, and has performed this work for several years. It is necessary to shear a sheep with a large fleece twice a year, to keep them comfortable and not too bulky for the power.

We have a nice little room in one corner of the basement of the barn, well lighted and ceiled with matched lumber. With this arrangement there is little carrying of milk, and all is convenient and comfortable. A neighboring farmer with a dairy of between 40 and 50 cows, uses one of these powers with a sheep with good success. They can be operated also by a large dog, and if desirable can be used for churning.

Where there is only the milk to separate, these powers can be employed to excellent advantage, as they require but little room, are inexpensive and can be placed where most convenient.

Franklin Co., Vt. E. R. TOWLE.

Michigan Dairymen's Association.

ED. HOARD'S DAIRYMAN:—There seems to be some confusion in relation to the dates of our next convention, which has usually been held the first week in February.

It was decided however, by the Executive Committee to hold the meeting in conjunction with the annual round-up meeting of the Michigan Farmers' Institutes at Lansing, Mich., Feb. 23-24-25, 1904.

The Tuesday and Thursday sessions

New Games

A FREE game—60 kinds—inside each package of

ST. LAMBERT BULL CALVES by Lucy Stoke Pogis 4th, sire of 13 tested cows, $25.00.
W. J. HUSSEY, Mt. Pleasant, O.

HIGH CLASS JERSEY BULLS
Heifers and Cows for sale. My foundation stock the best I could buy from a herd famous for merit. Write for what you want.
WM. B. GOODRICH, CLIMBING HILL, IOWA.

PROSPECT HILL JERSEY HERD
The cow that can DO something is what the farmers want. Eight cows have finished their official year's work making an average of 524 lbs. each. F. H. SCRIBNER, Rosendale, Wis.

VALLEY FARM is offering some bargains in young bulls sired by "Diploma's Victor, No. 56310, Grandson of "Brown Bessie," or will exchange for heifers equally well bred. For prices and pedigrees write Fred Stubley, Black Earth, Wis.

FOR SALE. Two A. J. C. C. Bulls ready for service; also some younger ones. Cows and heifers in calf to richly bred bulls. Write for pedigrees and prices. We have a few Berkshire Boar Pigs from unregistered sows left; cheap.
N. N. PALMER & SON, Brodhead, Wis.

POLLED JERSEYS
Richest Cow of all breeds in Pan-American Model Dairy. Winning Herd at Ohio and New York State Fairs, 1903. W. H. FORBES & CO., Yellow Springs R. R. No. 1, Ohio.

But Two Bulls Remain
That are old enough for service. One combines the blood of Stoke Pogis 5th, "Exile", "Ida's Rioter", Mary Anne", "Naiad", "Crocus", Allie", and Mollie Garfield", and the other four crosses of "Eurotas", through three of her sons, with some of the best St. Lambert blood.
To induce immediate sale these are priced far below their worth. If in need it is for your interest to write for pedigrees, and to do it TODAY. Ask for Sale List A20.
WINTERGREEN HILL FARM
SCOTTSVILLE, N. Y.

ROBINSWOOD JERSEY DAIRY has a few head of Young Jerseys, either sex, they are offering below their value, being overstocked. Also a few Barred, Buff, and White Plymouth Rock Cockerels, and one two-year-old Berkshire Boar, (registered.)
N. H. ROBINSON, Prop., Centralia, Wis.

J. Q. EMERY & SON, Albion, Wis

PLEASANT VALLEY HERD Of O. I. C. Swine. Headquarters for pure and fashionably bred stock. Boars ready for service. Sows bred and open growthy. Prolific fall pigs now ready to ship. Write for particulars and prices.
A. J. WELKER, ATTICA, N. Y

will be held in the State Capitol building. Tuesday afternoon will be devoted entirely to the butter makers and creamery men; Tuesday evening to the cheesemakers. Wednesday there will be a joint meeting with the Institute all day and evening in the Armory at the College with an excellent program on general dairy topics with several speakers of national repute. We expect a large exhibit of butter and cheese which will be judged on this day. A report and discussion will be made at our Thursday morning meeting, upon the same. This will also be the business session of the Convention, election of officers and selection of location of next place of meeting.

The indications are that this will be the largest and most successful meeting ever before held by the Association. The main reason for changing the dates of our convention was to enable our members to receive the benefit of obtaining the one-rate fare on the railroads, which has always been accorded the State round-up. S. J. WILSON.

Flint, Mich.

Turning Creameries into Cheese Factories.

ED. HOARD'S DAIRYMAN:—While reading through the columns of your valuable paper, I notice the question asked, Do you think we can make a success by turning creameries into cheese factories for a few months in the summer time, by having a cheese making instructor visit and take charge of a number of such factories, and it was replied to by E. H. Farrington, who thought the plan would work all right.

This plan will work all right if they have competent cheese makers in each factory, but the way I understand the question, they would expect the instructor to teach the other employees, and if that is the case, they had better get an instructor to teach the rest of them a couple of years before they try to run their business on that plan.

I am a cheese maker and know by experience that the summer time is the most difficult time to make cheese, and that is the time they expect to change about. I don't care how long a man has been at it, he will have curds in that time of the year that will puzzle him. Sometimes they come out and make very good cheese and other times not so good, and everyone has now and then a vat that isn't much good, although by mixing the poor cheese with the better ones, they sell on the market all right.

I know of a man that has made cheese for twenty years, and this last season he guaranteed his cheese and had bad luck and lost enough to take part of his wages. He had too much confidence in himself and thought he was about perfect, and the consequence was you never get too old to lose in the cheese business. I once heard a cheese maker say that when a factory run a million pounds in a season and the cheese maker said they lost no cheese, he made up his mind that he was tellIng a falsehood. Of course there are exceptions. We make the soft Michigan cheese in this locality, no Cheddar at all. I think if these gentlemen want to change over, they better get experienced help and leave out the instructor. F. A. S.

Morenci, Mich.

Sweet Curd Cheese.

ED. HOARD'S DAIRYMAN:—Do you know how to make cheese by the sweet curd system? I know how to make it by the acid system. R. E. P.

Cold River, Vermont.

In answer to the question, American home-trade, or stirred curd cheese is of a softer texture and milder flavor than the Cheddar or export cheese.

This is brought about by incorporating a larger amount of water with the curd, developing little or no acid in the cheese curd before salting and hooping, and by hastening the curing process by means of using higher rates of rennet and lower rates of salt, and not curing it so far as is ordinarily done with a well ripened Cheddar.

The distinctive difference between the two processes is that in the case of Cheddar cheese the aim is to get rid of all the water consistent with a compact union of the casein particles, while the aim is to retain as much water as possible in the stirred curd without having it appear in the form of free water in the cheese.

When properly made and carefully cured, at temperatures ranging from 40 to 50° F., it may be of excellent quality, being mild, soft, and creamy, but because of the large amount of water contained in it, it is easily subject to decomposition changes; goes off flavor rapidly, and does not bear tranportation well.

Another distinction between the two processes of manufacture is that in the home-trade cheese the curd is not allowed to mat into a mass after the whey is drawn from the curd, but is kept stirred so that the curd particles will not unite and the whey will drain off until dry enough, when alter more or less further maturing of the curd it is salted, pressed and cured.

If the curd is cheddared and milled shortly after matting, the resulting cheese will resemble the stirred-curd cheese in flayor and moisture contents, but will be closer in body, more meaty in texture with a finer, denser grain, developing into a more desirable cheese in all respects.

The Large versus the Small Dairy Cow.

ED. HOARD'S DAIRYMAN:—No act of Congress has been of greater advantage to the farmers than the act establishing and aiding the state experiment stations; and no special work done by these stations has been of greater importance than that done in the interest of the dairy farmer. It is less costly to learn at another's expense than at one's own; and by giving heed to the disinterested, nonpartisan work done by the stations, the dairy farmer may save himself much bitter disappointment, and not be misled by following the false teachings of certain dairy writers and breed partisans. As its most valuable work in this line, the Wisconsin Experiment Station has recently issued bulletin No. 102, entitled Studies in Milk Production. The present Wisconsin Experiment Station herd was established in 1898, and the Bulletin covers the work of this herd for a period of 4½ years.

In order to make comparison of results on a basis of type, the herd was divided into three classes: The small dairy type, the large dairy type, and the dual-purpose type. The men making this division were Messrs. F. H. Scribner, breeder of Jerseys; Charles L. Hill, breeder of Guernseys; Geo. McKerrow, breeder of Short-horns, and W. B. Richards, Asst. in Dairy Husbandry at the Station.

Pasture was figured at $1.50 per month, and other feeds at average Wisconsin market prices; while the butter was figured at 20 cents per pound, and the skim milk at 15 cents per 100 pounds. The butter was computed on the basis of 85.7 per cent of one pound of butter fat in the milk, equivalent to one pound of finished butter; usually known as adding one-sixth to the butter fat, and the standard now used by the Holstein-Friesian and Guernsey Associations in their official records made under the supervision of the experiment stations.

The conclusions reached, as a result of the most painstaking work through a period of almost five years, in which all the food given each animal was weighed, and each treated as though she alone were on test, confirm my teachings of 20 years past, that the larger type of dairy cow is the more profitable for the dairy farmer. Space will not permit me to give as much as I would like, but, as conclusively in favor of the large dairy type, of which the Holstein-Friesian is the best exponent, I quote the following:

COWS OF THE LARGE DAIRY TYPE PREFERABLE.

From the data presented it will be seen that, everything considered, cows in group B, representing the large dairy type, are clearly in the lead for economic production of milk and butter fat. The results of over four years' work with cows of the extreme dairy type, represented in group A, not only failed to establish the claims for the superiority of cows of this type over a much larger and apparently stronger dairy type, but clearly showed that they are not as large producers, nor as profitable dairy animals, as the latter.

"That the extreme dairy type has been popular, at least in this state, is evidenced, among other reasons, by the fact that three of the cows selected for the University herd at our solicitation by prominent dairymen in our state were fair representatives of this type of cows, and are included in group A. Our investigations have been conducted under the most favorable conditions possible for this type of cows: The stable in which they have been kept is considered a model one as regards cleanliness, light, ventilation and general comfort of the animals, and water is provided for them in the stalls so that they are not exposed to inclement weather at any time. They are given the best of care and attention at all times; being fed liberally; kept during the hot summer months in the cool, darkened barn, protected from sun and flies; and are fed various green feeds and grain in summer, as well as protected from cold in winter.

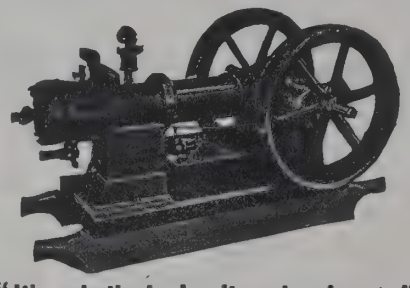
"In view of the ever-increasing demands on the part of dairymen for cows that will have endurance and ability to withstand diseases, as well as great productive capacities, we do not hesitate to state that in our opinion it is not the part of wisdom for our dairymen to select the small, refined cows with a spare habit of body in an extreme degree as the most desirable type of dairy cows.

THE FARMERS' OR DUAL-PURPOSE TYPE.

Neither is it the part of wisdom for the dairyman, as such, to select cows of a type similar to those in group C, representing the dual-purpose type, and to expect the greatest profit from them in the production of milk and butter fat. For the dairy farmer, the large type of dairy cow will, we believe, everything considered, be found the most profitable. In view of the results obtained with the different groups, it is apparent that cows with the greatest capacity for consuming rough feed are generally the most economical producers. This may be accepted as a fundamental characteristic of all cows capable of large and economical production in the dairy."

The Station's comparisons by breeds are very striking, and, as usual, the Holstein-Friesian breed is found to excel. Indeed, it seems that with fair representatives this great breed will always win in any net profit comparison, where both the butter fat and skim milk have values assigned. The average results of the breed comparison are as follows:

	Holstein.	*Guernsey.*	*Jersey.*	*Shorthorn.*
Annual yield of milk	9987.3	6530.7	5700.2	7121.4
Annual yield of fat	351.6	319.4	301.1	28.7
Annual value products	$94.03	$82.31	$77.10	$741.26
Annual cost of food	45.46	37.37	35.22	38.17
Annual net profit	48.47	44.94	41.88	36.09



A careful study of this table will show the dairy farmer that it is not the cow that gives the richest milk, but the cow which produces the largest amount of butter fat that wins out. During all those years, and for all their milk taken in bulk, the average for the Holstein-Friesian milk was 3.52 per cent fat, while the Jersey average was much higher; yet we see that the Holstein-Friesians averaged annually over 50 pounds more

VERTICAL ENGINE AND PUMP JACK WITH ALL IRON BED PLATE

of butter fat for each cow than did the Jerseys.

But this table does not tell the whole story; the Wisconsin Station had even better grounds for deciding in favor of the larger, hardier, more vigorous cows. If a farmer went into the dairy business for five years he would take account of stock at the beginning and at the end of the specified time; and if he found that the herd had increased or decreased in value, he would take such increase or decrease into consideration. The Wisconsin Station did not do this because it was making a study of milk production only; but it gives a resumé of each cow, and we can follow it out for ourselves. The Jersey list reads like a column of obituary notices. Out of 12 cows, one died of congestion of the lungs, one of bronchitis, two were got rid of because of loss of part of the udder from garget, two because found tuberculous, two because such delicate feeders as to be unprofitable, and one because of lack of constitutional vigor and dainty appetite—only three left out of twelve, and they not the best.

The hardy, vigorous Holstein-Friesian cows furnish a surprising contrast to this list. One did so well that a California breeder purchased her last summer at a long price, and took her to California. The rest are there and still doing business at the old stand, though there is one that Holstein-Friesian breeders would no doubt, be glad to get if they could. This is Alma Marie Josephine, who at three years old made a record of 18 lbs., 5.8 oz. butter from 400.3 lbs. milk, showing an average for the seven days of 3.77 per cent fat in the milk. The net profit for the one week was estimated to be $2.72.

The main deduction which the thinking dairy farmer must draw from the exhaustive work shown in this bulletin is that for the greatest net profit he needs cows of the large dairy type, such as the Holstein-Friesians; for, not only do they give a larger net profit, but by reason of their hardiness and great vitality, the large, vigorous Holstein-Friesians thrive on work which will break down and destroy the weakly constitutions of the small, delicately formed Jerseys.

MALCOLM H. GARDNER.

Darien, Wis.

Breeding and Feeding of Pigs.

ED. HOARD'S DAIRYMAN:—What is the best type of pig to rear and feed for marketable purposes? An animal possessing the following points may be taken as a type of pig to suit alike the breeder, feeder and consumer:—

Neat head. The pig that is very long in the head is usually narrow between the eyes, has seldom a very strong constitution, and has rather more bone than is required. On the other hand, the pig which is very short in the head is usually too fat, too heavy in the fore end, thick in the neck and heavy in the shoulders. Neat in the head means neither too long nor too short a nose. The ears should be fairly large, soft and pliable and should fall a little to the front, without actually being lopped.

Light neck and shoulder: The coarser parts of a side of bacon, and those which fetch the lowest prices, are the neck and shoulder. The lighter these parts, the better the side, and the higher the price it will make.

Deep heart and well sprung ribs: Pigs are usually deficient in these points, which are, perhaps, the most valuable of those here enumerated. For stock purposes, breeders should, therefore, select only those animals which have these characteristics strongly developed.

Thick loins: A pig with a good loin is almost invariably well ribbed, and has a strong constitution. From a breeder's and feeder's point of view, a good loin is most essential.

Stout thighs: This means a pig thoroughly well developed in the hams. The hams are the most important part of the animal, and, in the case of pigs killed for the ham and middle trade, the most valuable of all, provided they are not too fat.

Short legs: A pig that is long in the leg is nearly always flat in the ham, and lacking in plumpness.

Long and silky hair: Good hair is an indication of strength of constitution, as well as lean meat. The absence of hair generally proceeds from close breeding, and indicates a tendency to excessive fatness.

A long side of moderate depth, with thick flank. The above is the type of animal to be aimed at, whether thoroughbred, half bred or common bred pigs are kept.

To produce pigs having the qualities enumerated, the first consideration must be the selection of the boar. It is said that the boar is half the herd. Even this estimation undervalues his power of reproducing his like. It is, therefore, all-important that a boar possessing the particular points described should be obtained. At present, the improved, large, white Yorkshire appears to be the breed which possesses the required points, and a sire of this breed should therefore be selected.

The pig that commands the highest price is an animal which, when well finished, and not over fat, weighs about 170 pounds dead. A good pig ought to arrive at this weight at the age of seven months from birth.

In selecting a sow, there are a few points which a good specimen should possess, in addition to those mentioned for the boar. The sow should be docile, and should have at least twelve teats, of an equal size, and evenly placed well forward on the belly. Sows having large flat teats generally secrete very little milk, and on this account prove bad mothers. The fineness of the hair, skin and bone all indicate a good quality of flesh, and an animal that is likely to become a good mother.

Pigs should be well fed, but not overfed. It is only when fed regularly that pigs give the most satisfactory results to the feeder.

During the first half of the 16 weeks the sow goes in pig, she should be allowed to run on grass and should receive a limited amount of other food. For the last eight weeks she should be treated more generously, so that she may be in good condition, but not too fat, at the time of farrowing. During the time the sow is rearing her litter, she should receive as much good food as she will take, consisting of boiled potatoes, corn meal porridges, bran and skim milk.

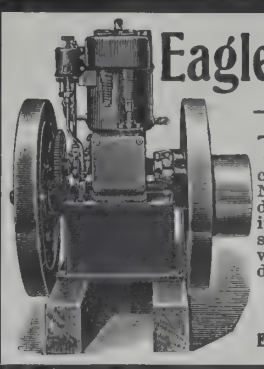
At three weeks old the young pigs begin to eat, and at this time should be supplied with skim milk, separated milk or fresh buttermilk, which may be mixed with a little pollard, bran and boiled potatoes, and given twice or three times daily. Care should be taken to prevent the young pigs having access to the sow's food. The sow may be permitted to eat up the food which the young pigs have left, but if the young pigs eat the sow's food they are almost certain to scour. When eight weeks old the pigs may be weaned. After weaning they should receive the same quantity of food in a sloppy condition and be allowed a little exercise.

When the pigs have reached about 100 lbs. in live weight, the amount of exercise allowed them must be limited. The food should now consist of boiled potatoes broken up, and mixed whilst hot, with a quantity of barley meal. After the pigs have eaten as much as they appear to require, a small quantity of butter milk, skim milk, separated milk or kitchen refuse should be added, to induce them to clean up all the food given them. The quantity of food which a pig should receive is just what it will eat up clean, no more and no less.

When being fattened, pigs should be fed three times a day. The food ought to be brought to a temperature of 90°F., by direct heating or by the aid of hot water. By doing so, much of the food is saved in the animal's body for the production of fat.

The addition of oats to the food of pigs which are being finished, improves the whiteness of the fat and makes the flesh firmer. The pigs should, therefore, receive oatmeal or bruised oats during the three or four weeks previous to the time at which it is intended to kill the animals. When the food contains a large proportion of brewery or distillery by-products, the fat produced is soft and of a yellowish color and the meat is not of good flavor. The excessive use of such products is therefore to be avoided.

Every farmer should try and breed the store pigs he requires, because in the first place a pig eight weeks old should not cost more than $1.50 to produce, whereas nearly double that is asked in the open market. Furthermore, pigs reared on the farm fatten more readily, and are therefore more economical than pigs bought.



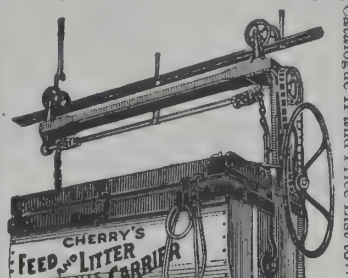
Swine fever is the disease most dreaded by farmers. This, it should be clearly understood, is a germ disease and is never spontaneous in its origin. The sole cause of swine fever is the introduction into the system of a healthy pig, of a specific germ from the body or excreta of a

The "Penny Wise and Pound Foolish"

Policy has an apt illustration in the man who buys a CHEAP gas or gasoline engine. Unreliable service, frequent and expensive repairs, wastefulness in fuel and short life offset many times over, the small saving in first cost. The "OTTO" is the original and BEST. Suppose it does cost a little more money, the extra dollars are well invested. 70000 users throughout the civilized world support us in this claim.

THE OTTO GAS ENGINE WORKS, Philadelphia, Pa.

Eagle 4 H. P. Stationary Engine



1904 MODEL

THIS ENGINE is of the four Cycle type and is especially designed and adapted for use on the farm—for separators, churning, pumping, elevating, hoisting, cutting ensilage, etc. No Expert or Engineer required to operate it—very simple in design and compact in construction. This engine is built so it can be easily moved from place to place. We can supply a special belt driven pumping jack to be used in connection with any pump having a wind mill head. NOW Is the time to Subscribe for HOARD'S DAIRYMAN.

diseased pig. There is reason to believe that the disease is not infrequently conveyed to places at which swine are kept, by means of persons who have been in contact with diseased animals elsewhere. The farmer who breeds the pig he feeds is less likely to suffer loss from this disease, than the farmer who buys. Great care should be exercised in keeping the houses in which pigs are kept, clean and comfortable. Cleanliness of the sties and feed pigs on suitable food are quite essential, if the animals are to be kept in a healthy condition, and so have power to resist infection. W. R. GILBERT.

Montreal, Can.

Constructing a Cheese Curing Room.

ED. HOARD'S DAIRYMAN:—The Cheese Co. are contemplating building a new cheese curing room. Our factory is in a low place and a pond close by, and we are troubled much with cheese moulding.

Can you give us a plan of room needed to hold the product of 5000 or 6000 pounds of milk daily, and the best method of shelving and ventilation?

Prairie City, Mo. P. C. CHEESE CO.

In reply to the question asked in the inclosed letter I would say that in the location of a cheese factory no one thing is more important than to secure a well drained site, and yet, this is, in many cases, the last thing thought of.

The foundation of cleanliness in a cheese factory begins with the sewer. Other things being equal, then, elevated ground should be selected as a proper site for a factory. Another matter that may prove of considerable value is a regard for the natural or artificial shelter that may be given the factory building.

A difference of eight or ten degrees in the curing room temperature can often times be secured by having a due regard to the advantages of shade from groves or the channels of natural air currents. The surroundings should be such as to insure pure air with little dust. Trees and shrubs around the factory aid in purifying the air. If one can choose a site for placing of the curing room, a north side hill is better than any other. The east is better than a west slope, but a north exposure is the best, so that the windows may be on the north side. It is not well to locate the building on a bleak site, exposed to the full rays of the torrid summer sun or to the cold winds of winter.

The building should be laid upon solid foundation walls rather than upon piers. Beside adding decidedly to the appearance of the building, it aids materially in keeping the building warm in winter and cool in summer. The outside should be neatly and tastefully painted in light colors, as they reflect the sun heat best, while dark shades absorb the heat.

The construction of the curing room should be on the principle of cold storage building. The studding outside should be covered with matched sheathing and drop siding, with a layer of three ply acid and water-proof paper between. For the inside, a layer of matched sheathing is first nailed to the studding, then strips of one inch in thickness by two inches in width, to which are nailed two thicknesses of matched sheathing with a layer of water-proof paper between. The space between the studding should be filled with cork or sawdust or some similar material. The inner spaces must be closed air tight at the ceiling and floor.

The ceiling should consist of two thicknesses of matched lumber laid with tight joints with the layer of water-proof paper between. Double doors and windows are essential. In the construction of the curing room floor there are certain fundamental conditions which should be observed. The cooling effect derived from the ground temperature should be utilized. Therefore the floor ought always to be made of some good conductor so that it will be always cool. The most available material for this purpose is the cement or solid concrete floor, and if constructed properly, is sanitary, substatial, and much superior to wood. To avoid the danger of cracking the cement, it may be best to dig holes twelve inches square and a foot deep where the supports for the cheese tables are to come, and fill them with concrete so as to form piers to carry the weight.

The dimensions of the room in which to cure the product of six thousand pounds of milk per day should be twenty-four feet wide by thirty-six feet long with ten foot ceiling. Four rows of double shelving running lengthwise of the room, four tiers in heighth will give ample shelving space. The curing room to be complete should be equipped with the sub-earth duct. Those contemplating the building of a duct should secure the services of Mr. E. L. Aderhold of Neenah, Wis., Expert Traveling Cheese Instructor for the Wisconsin State Dairymen's Association. U. S. BAER.

VETERINARY.

Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

Inflamed Quarters.

I have a cow that had trouble in one quarter with her last calf. One teat became obstructed with a hard lump at the entrance. I opened it repeatedly with a bistoury, bathed thoroughly with hot water twice a day, used a plug and milk tube, but was never able to restore to a normal condition. Could only draw a few drops of milk at a milking. The inflammation left about two months before she dried off I ceased milking from that quarter. She freshened again a few days ago. The same quarter is badly swollen and hard. Am bathing twice a day with hot water, rubbing thoroughly, then oiling with lard and camphor. Have opened it again, but can only get a few drops of matter. W. J. W.

Riverside, Cal.

ANSWER.

If you had continued to milk this quarter last season, no matter how little milk she may have given, it is quite likely that the quarter would have gained its normal condition by this freshening. But as the quarter is practically dead there is no chance to restore its natural function. The best advice we can give is to rub it with oil of camphor. The milk will soon disappear and so will the swelling.

Swollen Quarters.

I have a peculiar disease among my milch cows. It begins with swelling of the udder on the right side. It becomes hard, feverish and painful, but only affects one or two chambers of the bag. Comes on very suddenly and lasts about a week or ten days and then gets well. E. D.

Argos, Ind.

ANSWER.

It is possible that your cows are not as comfortable in their stalls as they might be, thereby squeezing these quarters while lying on them. Your trouble appears to be from a local cause. Ascertain the cause and remove it.

Cramp Bark as an Anti-Abortient.

Will you please give your opinion on feeding cramp bark to cows to prevent abortion, through HOARD'S DAIRYMAN. State dose, and how long should it be fed before calving?

Pa. SUBSCRIBER.

ANSWER.

You may start one or two months before the usual time of abortion and give an ounce twice or three times daily in food or drench. This will strengthen the generative organs and thus may aid to prevent abortion. But you must not omit the usual antiseptic precautions, which are very important in your case.

Mastitis.

For the last month I have been bothered with caked bags amongst my dairy cows. They refuse to eat their feed, ears and tail cold and shiver; the bags cake, the milk either curdles or turns yellow and two of them (the cows) got very stiff or weak in their hind quarters; the teats affected almost dry up after they are getting well. G. W. V.

Haines, Ore.

ANSWER.

Give a full dose of physic and follow with ½ oz. of fluid extract of poke root and 1 oz. of potassium acetate in a quart of water. Continue the latter every four hours until relieved. Hot fomentations to the udder are indicated, also hot lard after the fomentations; milk as often as possible to relieve the udder of its contents.

Tonic for Run Down Cows.

Quite a number of my cows have,and will have calves in a short time. After calving they seem to become sick, lose appetite, and for eight or ten days give scarcely any milk. Have given them Epsom salts and ginger, also tepid water and sorghum molasses, besides other remedies. Think they need a tonic and would like to know what is best. A. A. M.

Jackson, Miss.

ANSWER.

Quinine sulphate, 2 ozs.; gentian root, 3 ozs.; nitrate of potash, 2 ozs.; dried sulphate of iron, 3 ozs. Give each cow a large teaspoonful night and morning in ground food a little moistoned.

Lymphangitis.

My horse was, to all appearance, all right at night, and on going to care for him next morning I found him standing on three legs. The left hind leg was very badly swollen, especially on the inside, which was rigged up clear to the body. He would not touch it to the floor unless forced to do so. He was shivering, his pulse and respiration too quick; appeared in great pain, and would not eat. What is the trouble? One says, "Give him a moderate dose of physic and keep his bowels loose, bathe the leg with hot water, and after physic has operated give as follows: Sulph. iron, 1½ ozs.; cream of tartar, 4 ozs.; sulphur, 4 ozs.; nitrate potash,3 ozs. Dose, one tablespoonful in bran mash night and morn-

EASY CALF WEANING AND FEEDING.

Whoever was brought up on the farm has painful recollections of experiences when the calves were weaned and taught to drink. This hand work, like many other pieces of farm drudgery, has been largely done away with. There is a new and better way. We are illustrating herewith the Keystone Calf Feeder, manufactured by M. T. Phillips, of Pomeroy, Pa,, a device considered one of the best of its kind, and carrying with it the endorsement of large dairymen, Agricultural Colleges, Experiment Stations, etc. With this appliance the calf scarcely knows of weaning time. The device is so nearly in keeping with the calf's nursing by the cow that it takes to it naturally from the first. Not only is the matter of teaching the calf to drink from the bucket avoided, but it gets its food slowly, in proper quantities, in the natural way, and thus escapes the evils that attend the bolting of the food. The Keystone feeder has a large use. Its cost is but little compared with the time and worry it saves. Mr. Phillips distributes a little book which describes the Feeder. It will interest any one who is still weaning and feeding his calves the old way.

WANTED A good man to take charge of dairy farm on shares, 1 mile from Agricultural College, Good farm, good market, and splendid chance for right man. Great opportunity for man with children to educate. Address BOX 180, AGRICULTURAL COLLEGE P. O., MICH.

ILLUSTRATION.

THE PHILLIPS DEHORNING KNIFE.

The dehorning knife has come to be almost a stable necessity to the dairyman and cattle feeder. There are several knives on the market, but, perhaps none that is so satisfactory from every consideration as the one manufactured by M. T. Phillips of Pomeroy, Pa. Its great point of advantage is that it cuts from all four sides at once, and thereby secures a clean, clear cut that is all cut and no breaking or crushing. Several of the Government Experiment Stations have given it unqualified endorsement. The acting director at Cornell University commends especially its "ease of operation and durability," and describes it as "the best instrument of its kind that we have ever used." Mr. Phillips is constantly receiving testimonials. He sends us a recent one from which we quote briefly to show how it is regarded and the width of territory it covers. "The dehorner is a perfect machine. A boy and myself dehorned a bull this morning that had not been led out of the barn for three years, and had no trouble as to cutting off the horns." ED. HULBERT, Dallas, Wis. Mr. Phillips advertises the dehorner regularly in our columns. It would pay any one interested to write him for a copy of a little descriptive book he sends out free.

Why RUMELY?

The thresherman has many reasons, too many to give here. Summed up, it means the model threshing outfit, the best money can buy. You will find the latest catalog on **Rumely's Rear Geared Traction Engines and New Rumely Separators** full of threshermen's logic, argument that convinces. Write us for it. Mailed free.

DENCE & MERY, 111 Mery Block, Toledo, O.

ing. Another says, "Give nux vomica in 40 drop doses twice per day for ten days, then feed linseed meal enough to physic. Which is right?
Garrattsville N. Y. G.

ANSWER.

Your horse has an attack of lymphangitis, due to an excessively rich condition of the blood. Give the following at one dose: Aloes, 7 drams; ginger, 2 drams, dissolved in a pint of water. Then commence to give the following: Aconite, 1½ drams; potassium nitrate, 2 ozs.; spirits nitrous ether, 2 ozs. Add water to make one pint. Mix. Give 2 ozs. every hour for 8 hours. Rub the swollen parts with equal parts of mercurial ointment and sweet lard once daily. Apply plenty of friction while rubbing.

Cow Pox.

My herd of cows are affected with what I think must be cow pox. The udders become swollen in several places as though they had been stung by a bee or some insect and in a few days the swollen place will suppurate and will dry up and several more places will come. It seems to affect the herd I have used Iodide ointment prepared by a local druggist, but with little benefit.
Springfield, Ky. H. M. O'N.

ANSWER.

If you had the ointment prepared by a druggist, there is no doubt about its correctness, as they prepare it according to the United States Pharmacopoeia which is standard in this country, but it may be that it was not fresh. If this is the case, it does not give the required results. Iodide ointment must always be used fresh, as it will lose its strength and be inactive in a short time.

Leucorrhoea.

One of my cows has a vaginal discharge of a yellowish white and very offensive matter. The matter is tough, and requires some little effort to separate the protruded portion. J. C. R.
Mexico,

ANSWER.

This is probably due to injuries inflicted during parturition, or there may be ulceration of the vagina or the os-uterus. Your treatment must be applied locally to the parts affected, which will not be safe to attempt at the present time, as she is too near the period of parturition for such treatments, which are liable to cause abortion.

Septicemia.

We have a cow that we noticed about forty days ago going down, getting poor. At present she is a rack of bones, eats and drinks scarcely any thing; goes out in field with rest of cattle. She lost calf about eight months ago; did not clean for a good while, we had to take them from her. A READER.
Parnell, Mo.

ANSWER.

This is due to unclean fingers while taking away the placenta, which has infected the cow and caused the trouble. Give the cow an ounce of tincture chloride of iron in a quart of water, twice daily, as a drench, and add a teaspoonful of the tonic mentioned in this issue for A. A. M., Jackson, Miss.

Heart Failure.

Yesterday I lost a fine Guernsey cow, and I will give you the circumstances: Another cow in the corral was on a spree, and this Guernsey reared upon her, and as soon as she landed upon her feet she began to tremble all over, and in a moment later she fell down and was dead in two minutes, D. MACA.
Lawrence, Kansas.

ANSWER.

Heart failure was most likely the cause of death.

Obstructed Teat.

I have a cow that I cannot get the milk down into the teat without the use of a milk tube. When I introduce the milk tube it seems to meet some obstruction about 2 inches up in the teat, but cannot get any milk until I get through this. There seems to be a very small hole through this but it is sometimes very hard to find and after the tube goes up through this the milk runs quite freely. There are three lumps on the back side of the udder; they seem to be right under the skin and can be moved around very easy. They are not very hard and do not seem to hurt her any if you take hold of them. G. W. F.
Lansing, Mich.

ANSWER.

Your remedy is the teat bistoury which will give immediate relief. The lumps in the udder may be warts under the skin; if they do not hurt the cow it is just as well to let them alone.

Prolapsus of Rectum.

I am having trouble with some shotes that I am feeding. The gut comes out about one inch and gets very bloody, H. G.
Donnellson, Ia.

ANSWER.

Give the anima l from ½ to 1 grain of morphine hypodermically according to its size and age, then wash the protruded bowel with warm water and a very little soap, care being taken that the soap is not sufficient to irritate the parts. When clean, dry carefully and anoint with olive oil which has been slightly carbolized, to this add a little opium (enough to act as a local anodine.) You may now begin to carefully replace the bowel into its natural place, when it has been so replaced, introduce your finger gently and remove all the feces within your reach. After this inject some of the oil and opium into the rectum to prevent straining. Sometimes a suture will be of good service, this is drawn around the anus so as to prevent the bowel from returning. Give the animal plenty of water and feed no solid food. Give a laxative dose of castor oil, but prevent purgation.

Retention of Placenta.

What can I do for retention of placenta and prevention for same. J. R. B.
Annandale, Va.

ANSWER.

This is due to lack of tone in the organs of generation, when it does not follow abortion. Give the cows the tonic prescribed in this issue.

Abortion.

Can you suggest a remedy for cows losing their calves, or otherwire slinking as we may call it. Is it apt to leave a cow subject to slinking. Also what to do when can't get a cow with calf?
Johnstown, N. Y. C. S.

ANSWER.

We must first of all isolate the cows which have aborted, destroy the afterbirth and foetus and thoroughly disinfect the stables in which they have aborted; whitewash the walls and give plenty of light in the stables. About the best agent to apply to the floor is air slacked lime. Apply it once daily after cleansing. It is advantageous to put the healthy cows to pasture. The cows which have aborted should not be allowed to retain the afterbirth; the same should be promptly and completely removed, and the uterus and vagina thoroughly cleansed by irrigating same with a 1-5,000 solution of bi-chloride of mercury, or other disinfecting agent. This can be done best by using a fountain syringe, and may be repeated once daily until the disappearance of the vaginal discharge. Until this has entirely disappeared, no cow should be used for breeding purposes.

We may also increase the resistance of all the animals by means of food rich in nitrogen and a teaspoonful or two of powdered cramp bark in food once daily.

A cow which has aborted and retains the placenta usually will not breed, but if cared for as above directed, you will avoid this trouble.

Must not Eat Eggs.

ED. HOARD'S DAIRYMAN:—One of the cooking authorities, who is at the same time a kind of guardian of the morals of public diet, has now gone on record as saying that the eating of eggs for breakfast is accountable for the alarming increase of divorce.

It is said that the candidate for divorce will get up in the morning and eat an egg or two, and repeat this operation upon eggs prepared in all the different ways known to modern, but unmarital cooking, till the unfortunate creature lands in the divorce court. We farmers and feeders know there is nothing like feeding for a purpose and those of us who love our good wives, will hereafter view with alarm any leaning they may devel p toward too frequent egg breakfasts.oOf course we can control the situation somewhat by cutting down the feed supply on the old hen, or feeding her for the purpose of not getting eggs; or we may gather the eggs and keep them out about the barn till the basket is full and then take them to the store and trade them off for some anti-divorce breakfast food, that is guaranteed to furnish vim, vigor and virtue to such women as are getting weak-kneed on the marriage vow and its obligations.

The authority says that egg-eating women get lazy, and loll around in easy chairs, reading the morning papers, neglecting their homes and husbands and treading the downward path generally.

That properly cooked eggs are delicious is admitted, but they are dangerous and must not be trusted. My recent personal experiences with eggs, I must say, are starting some divorce thoughts in my mind, for, for some time past I have been eating around at restaurants and places, and I have met eggs of such various conditions, ages and conditions of preservation that divorce is going to occur soon—the eggs and I are going to part. There is a manifest insurmountable incompatability and the divorce is inevitable.

If I may prescribe for those dreading the egg-eating habit I would suggest a more balanced ration, and for the average woman of good wit and about 140 pounds I think she might try: Pioneer porridge with sugar and real cream, an egg or two, two strips of sugar-cured, country bacon, buckwheat cakes and butter and maple syrup, taken slowly, without airs, with a merry heart and a clean conscience, after not less than eight hours refreshing sleep. This should help you to "be sunny." W. F. McS.

The Iowa Butter Contest.

ED. HOARD'S DAIRYMAN:—The fifth scoring in the Iowa Twelve Months Contest has been completed and I send you herewith the results, which are as follows:

Nick Knutson, Emmetsburg, Iowa, wins the first place in this contest with a score of 97 at Ames, 93 in New York, and an average of 95. Chemical analysis: Fat, 83.84 per cent; moisture, 12.57; curd, 1.79; salt and ash, 1.80.

A. A. Palmer gets second place with a score of 96¾ at Ames; 91 in New York, and an average of 93⅞. Chemical analysis: Fat, 79.96 per cent; moisture, 16.42; curd, 1.27; salt and ash, 2.35.

Mr. S. W. Laird, Walker, Iowa, ranks third highest with a score at Ames of 96¾; in New York, 90½, which makes an average score of 93⅜. The chemical analysis of this butter is, fat, 85.14 per cent; moisture, 12.25; curd, 1.02; salt and ash, 1.59.

J. P. Nielsen, Brayton, and R. J. Erb, Arbor Hill, Iowa, tied for fourth place with an average score of 93¼.

The next and last scoring in this year's Iowa contest will take place during the beginning of January, and all butter should be here at Ames on the last day of December. As this is the last test, all are urged to send in a tub.

The prizes to the winners will be awarded as soon as the results can be obtained. A gold medal will be given to the one who gets the highest average, and a silver medal to the one that has second highest. A certificate showing the average chemical analysis and scores will be given to all who have an average score of 90 or better.

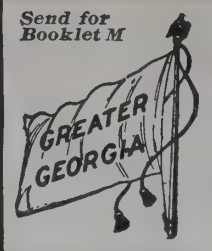
WM. H. CALDWELL, Secr'y.

Peterboro, N. H., Dec. 21, 1903.

A Quart Baby.

Now and again there is an item in the newspapers concerning the birth of a puny baby so small that a quart cup holds it comfortably. If the article told all the facts it would probably tell also of a mother who in weakness and misery had looked forward to the baby's advent with shrinking and fear.

To have fine, healthy children the mother must be healthy, and it is the common testimony of mothers that the use of Dr. Pierce's Favorite Prescription not only promotes the mother's health but also gives her strength to give her child.



"Favorite Prescription" accomplishes these results by tranquilizing the nerves, promoting a healthy appetite, and giving refreshing sleep. It increases physical vigor and gives great muscular elasticity, so that the baby's advent is practically painless. It is the best of tonics for nursing mothers.

"I gladly recommend Dr, Pierce's Favorite Prescription," writes Mrs. J. W. G. Stephens, of Mila, Northumberland Co., Va. "Before my third little boy was born I took six bottles. He is the finest child and has been from birth, and I suffered very much less than I ever did before. I unhesitatingly advise expectant mothers to use the 'Favorite Prescription.'"

Dr. Pierce now feels fully warranted in offering to pay $500 in legal money of the United States, for any case of Leucorrhea, Female Weakness, Prolapsus, or Falling of Womb which he cannot cure. All he asks is a fair and reasonable trial of his means of cure.

Dr. Pierce's Common Sense Medical Adviser, containing 1008 pages, is sent *free* on receipt of stamps to pay expense of mailing *only*. Send 31 one-cent stamps for the cloth-bound volume, or only 21 stamps for the book in paper covers. Address Dr. R. V. Pierce, Buffalo, N. Y.

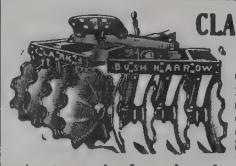
Buy You a Ticket to CROOKSTON, MINN., and call upon

The Polk County Land & Loan Company



For Choice Red River Valley Farms. They pay railroad expenses if you buy from them. A few good bargains.

360 acre farm, 4½ miles from Crookston, Minn., a city of 7,000 inhabitants, and 2½ miles from the State Experimental Farm. This is a photograph of the buildings as they are today: House is 16x24 1½ stories with an L 14x22, and a wood shed in connection 20 feet square, all on a brick foundation. Barn 28x48, with a lean to 16x48, sheeted both inside and out. Two granaries, one 14x80, and the other 14x42. The buildings are all well painted and in very good repair, and has a fine artesian well. Every acre of this farm is under a high state of cultivation, and is well drained by a slight ravine running through the farm merely sufficient for self drainage. The soil is a rich, deep black loam with a clay sub-soil, and in every respect is considered to be one of the best farms in that vicinity. Our price on this farm is $35.00 per acre.

This is a **320** acre farm about 2½ miles south of the city, this farm is quite well improved, has a very good house of about seven rooms, 1½ stories, barn large enough for ten head of horses, also a good granary, pasture and an artesian well, also has a good well at the house, good grove around the building. This is a very choice piece of land for the price $32.50.

160 acres north-east of the city; this is all hay land, and located in a German settlement, the surrounding country is nearly all under cultivation; we consider this a good piece of land for an investment, this could all be put under the plow, if desired. Price $19.00 per acre.

When the Butter Won't Come.

ED. HOARD'S DAIRYMAN:—Having had considerable experience in butter making, I may be able to assist the correspondent who complained not long ago of having trouble with his churnings.

In the first place, let us ask if he has in his herd one or more farrow cows, or cows long in lactation? If so, he probably need look no further for the source of trouble. I have known the milk from one such cow to inoculate the entire churning and render futile all efforts toward separating the butter, no matter how long continued. Where all-the-year dairying is followed, this difficulty is rarely experienced since the milk from fresh cows introduced from time to time overcomes the viscosity of the others.

The remedy, where this is the existing source of the difficulty, would be to leave out the milk from such cows as are advanced in lactation, or in other words, nearly dry. Such cream usually foams or froths up in the churn. Scalding the milk before setting is sometimes beneficial in these cases.

From the fact that the butter will not gather, one would infer that there is some other cause for the trouble, however, and I suspect the real one may be too low a temperature. In winter it is quite possible to bring the butter to the point where it breaks, but will not gather, solely because it is too cold and the globules will not adhere. I have seen cases where the globules were so small that they would pass through an ordinary butter sieve and rise to the top of the rinsing water to the thickness of an inch or more when attempting to complete the process as usual.

The addition of hot water to that employed in washing the butter, until it is at a temperature of 62° to 64° at this season of the year, will work like a charm when butter acts in this way. But the temperature of the cream should be carefully tested from time to time, during the operation of churning, and not allowed to fall below 60°.

Then by warming the rinsing water up to about 62° to 64°, it will leave the butter in exactly the right condition for salting and working. It is time thrown away to spend it at a churn handle in winter with the cream much below 60°, unless the ripening has been thoroughly done, and a proper degree of thickness secured.

Personally, I never saw very good results follow diluting the cream with hot or warm water. This thins it and frequently hinders the coming of the butter. If cream is to be warmed it is better to put it in a tin pail, where it can be placed in a larger one containing hot water, stirring the cream constantly to prevent whey forming as it will if any one place gets too warm.

The addition of dry salt or a little strong brine at the time the cream breaks, is an advantage. It assists in the separation, and the butter rises to the top of the buttermilk more completely than when salt is not added. This makes the buttermilk salty, and is objected to by some, but when, as is the case on the average farm, the buttermilk goes to the pigs the objection is not a serious one, and the women folks soon learn not to add salt to anything they make with buttermilk, in cooking or baking.

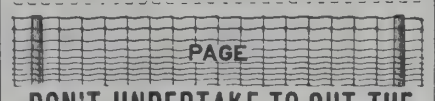
My experience in buttermaking has been principally with Jerseys and Guernseys, and the temperatures above given might not in all cases be best.

Michigan. MRS. E. E. ROCKWOOD.

Experience With a Dairy Herd.

The story by W. S. Keene of his experience in starting and improving a herd of dairy cattle at Palmyra, Me., was one of the most valuable features of the Maine Dairy Conference, Dec. 3. Said Mr. Keene:

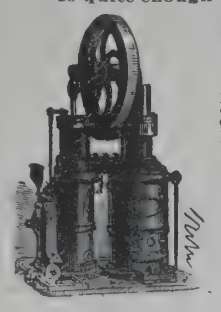
"I will give you my experience in building up a dairy herd, as this may interest you as they are right in Maine and many of you have seen them. I began nine years ago, bought six of the best common cows I could find; I paid $50 apiece for them. I worked along and used scrub bulls and raised a few calves for three years, but I did not get ahead any, for the reason that I had no means of knowing what my cows were doing. I mean by this that I did not keep an account with each cow to see what she was doing.

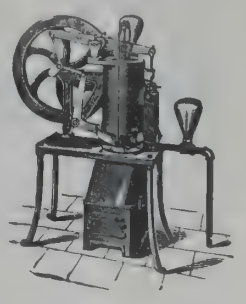


"Six years ago I began to keep an account with my cows. I bought a set of scales and put them in the tie-up and from that time to the present every cow has had to stand on her own merits. I bought me a registered Holstein bull and began to raise my own cows. Today I have about forty cows and heifers, and this fall I won fifty ribbons at the Bangor and Lewiston fairs. My standard when I began was 2,800 quarts a year and today my two-year-old heifers are averaging 4,000 quarts a year, and my mature cows about 5,000 quarts.

"I am able to get $10 apiece for all my grade-heifer calves when a few days old, as against $1 when I was breeding from scrub bulls My grade bull calves sell readily for from $5 to $10 at the same age, to feed for veal or raise for steers. I have never sold any of my registered heifer calves because I am getting my whole herd into registered stock, but my thoroughbred bull calves sell at $30 to $40 when dropped, and I sold one at five months old for $80.

"Now, the only way I ever got started was in knowing, first, what every cow was doing. Lots of cows start out with a big mess and dry up in a few months so that they do not pay their keeping. I sell that kind as soon as I find them out, but I never could find them out if I did not weigh their milk. I produce milk for the Borden Condensed Milk Company, whose factory is at Newport. They buy milk by the pound, so I do not test my milk for butter fat, but they test all the milk they buy about once a week and they report that my milk tests, on an average, about four per cent, and that, they say, is good enough for them. If I was selling cream I would send a sample of every cow's milk to the creamery about once a month, and have them test it for butter fat, and in this way I would weed out any cow that was not profitable as a butter maker.





"My best cow to date was Lady Felker who produced in 365 days 17,694 pounds, 14 ounces, and her milk at factory prices sold for $199.73. She was a thoroughbred, and raised by Henry Boardman of Bangor, who several years ago started a herd of Holsteins that were second to none, and would have been a great benefit to the dairymen of Maine if they had been ap-

LET US POINT OUT A GOOD FENCE

If you are going to buy any fencing this season, it is important that you buy the best fence on the market, and that you buy it at the Right Price. WE POINT OUT OUR
Advance Fencing
as being the best made fence on the American market. It has a continuous stay wire which is woven into the top and bottom strands from one stay to the next without leaving any loose ends. The stay wire cannot slip or slide on the horizontal strands. We have a Free Fence Book, which tells all about our twenty-three different styles of ADVANCE FENCING, a fence for every need on the farm. This book also tells how we sell our ADVANCE FENCING direct to the farmer, giving him the advantage of the dealer's and jobber's profits. It also tells how we sell Advance Fencing on 30 Days' Free Trial which gives you ample opportunity to be absolutely satisfied that you are getting just what you want. We Pay the Freight. This enables you to know just what the fencing is going to cost laid down at your railroad station. It is the fairest fence offer ever made by anyone anywhere. Send for our FREE FENCE BOOK and find out all about ADVANCE FENCING and our liberal offer before purchasing. Write for it at once. DO IT NOW. ADVANCE FENCE COMPANY, 33 H Street, Peoria, Illinois.

The Advance Tie
LT

preciated and continued. This cow I rescued from a butcher when she was two years old, for $30. I have another thoroughbred which is giving between fourteen thousand and fifteen thousand pounds this year, and has a day's record of seventy-five pounds, ten ounces, and in thirty days gave almost two thousand pounds.

"I have a grade that has just closed her year and gave 14,600 pounds, an average of forty pounds, for the year, and the milk sold for $186. One of my grade three-year-olds is giving over thirteen thousand pounds with her second calf, and gave over ten thousand pounds with her first calf. One of my thoroughbred two-year-olds is just closing her year with a record of about 10,500 pounds. So you will see that I have succeeded in improving the capacity of my herd in the past six years, and I hope to keep on improving it for years to come, and what I have done and hope to do, you may all do by using the same methods."

Shredded Silage.

ED. HOARD'S DAIRYMAN:—Would like to say a word or so on two questions in the issue of Dec. 11th, page 989: 1st., Filling Silo with Shredder—I have used silage that was put in with the shredder, and it was as nice as any I ever saw, not dry fodder—it was put in as it was cut, same as any silage is made, some ears went in whole.

Second—Cultivating Corn with Smoothing Harrow—I have cultivated corn, potatoes, wheat, rye and oats, with harrow with good results; but it is sometimes overdone, cultivating too much, or when the ground is too wet. Do not see why it would be better, or as good as a weeder, as an ordinary harrow is rather heavy for such work.

Have known farmers to make harrows that worked nicely, out of 2x2 pine. Same pattern as their heavy ones, using large wire spikes for teeth. Slanting them back a little and putting a rivet, made of a smaller wire nail, with a collar to fit, through the wood each side of every tooth. If made in winter they cost little except for material.

New Salem, N. D. O. S. C.

Mr. W. W. Marple of Missouri, puts this feed question in a pithy form. He says.

The milk cow has been fed on shucks to make twenty-cent butter, while her brother has eaten corn, to make 4 cent beef. She has been sheltered in post oak brush, while the good warm barn was used to keep a forty-dollar race horse in. The cow's only protection in winter a heavy a coat of frost, and for which, she gave in return $50 worth of butter. The race horse wore a nice red blanket, and won $10 at the county fair in the fall, and yet with all these indignities, the cow has patiently awaited her day.

Official Records of Holstein-Friesian Cows. from Dec. 3 to 18, 1903.

During this period records of forty-seven cows have been received.

In the seven-day records eighteen full-age cows averaged, age 6 years, 11 months, 18 days, days from calving 20: Milk 434 9 lbs., butter fat 15.493 lbs., equivalent butter 18 lbs., 1.2 oz., percentage of fat shown in the milk 3.60. Three four-year-olds averaged, aged 4 years, 4 months, 25 days, days from calving 33: Milk 416.9 lbs., butter fat 14.686 lbs., equivalent butter 17 lbs , 2.1 oz., percentage of fat shown in the milk 3.53. Twelve three-year-olds averaged, age 3 years, 6 months, 4 days, days from calving 19: Milk 395.1 lbs., butter fat 13.680 lbs., equivalent butter 15 lbs., 15.3 oz., percentage of fat shown in the milk 3.48. Twelve two-year-olds averaged, age 2 years, 2 months, 13 days, days from calving 31: Milk 302.8 lbs., butter fat 10.101 lbs., equivalent butter 11 lbs., 12.5 oz., percentage of fat shown in the milk 3.30. Several of the cows have made records ranging from fourteen to sixty days.

It must be borne in mind that these records are made under the careful supervision of agricultural experiment stations and that 85.7 per cent of a pound of fat found in the milk is equivalent to a pound of butter. In detail the records were as follows:

Minnewawa Lily 47277, (seven days previously reported), for thirty consecutive days—5 years, 4 months, 10 days, days from calving 7: Milk 1,682.2 lbs., butter fat 65.765 lbs., equivalent butter 76 lbs., 11.6 oz. Owner, Chas D. Pierce, San Francisco, Cal.

Fidessia 43105—6 years, 3 months, 7 days, days from calving 7: Milk 431.1 lbs., butter fat 19.087 lbs., equivalent butter 22 lbs., 4.3 oz. Record for thirty consecutive days: Milk 1,929.6 lbs., butter fat 72.896 lbs , equivalent butter 85 lbs., 0.7 oz. Record for sixty consecutive days: Milk 3,830 7 lbs., butter fat 136.081 lbs., equivalent butter 158 lbs. 12.2 oz. Owner, Chas. D. Pierce, San Francisco, Cal.

Belle Terzool Mecthilde 50119—6 years, 4 months, 26 days, days from calving 15: Milk 440.6 lbs., butter fat, 17.643 lbs., equivalent butter 20 lbs., 9.3 oz.

Jessie Rector 61781—10 years, 3 months, 10 days, days from calving 23: Milk 508.3 lbs. butter fat 16.442 lbs., equivalent butter 19 lbs., 2.9 oz. Owner, A. J. Daugherity, Streator, Ill.

Barrington Onda 44011—10 years, 6 months, 12 days, days from calving 21: Milk 534.3 lbs., butter fat 16.342 lbs., equivalent butter 19 lbs., 1.

Queen Pietertje Mercedes 49581—5 years, 2 months, 7 days, days from calving 6: Milk 410.4 lbs., butter fat 16.268 lbs., equivalent butter 18 lbs., 15 7 oz.

Parthenea Doede 53784—7 years, 3 months, 15 days, days from calving 38: Milk 451.8 lbs., butter fat 16.108 lbs., equivalent butter 18 lbs., 12.7 oz. Owner, John B. Irwin, Minneapolis, Minn.

Maid of Cloverdale Queen 57434—6 years, 4 months, 10 days, days from calving 31; Milk 448.4 lbs., butter fat 15.775 lbs., equivalent butter 18 lbs., 6.5 oz. Owner, A. J. Daugherity, Streator, Ill.

DeKol Nymph 49272—5 years, 3 months, 5 days, days from calving 23: Milk 458.1 lbs., butter fat 15.753 lbs., equivalent butter 18 lbs., 6.1 oz. Record for fourteen consecutive days, days from calving 17: Milk 878 lbs., butter fat 29.317 lbs., equivalent butter 34 lbs., 3.2 oz.

Fenna Y. Pietertje 47559—5 years, 6 months, 17 days, days from calving 21: Milk 483.7 lbs., butter fat 15.596 lbs.,equivalent butter 18 lbs., 3.1 oz. Record for 14 consecutive days, days from calving 14: Milk 962.7 lbs., butter fat 29.306 lbs., equivalent butter 34 lbs.,3 oz.

Pietertje Lass 2d 50657—6 years, 11 months, days from calving 12: Milk 484.8 lbs., butter fat 15.464 lbs., equivalent butter 18 lbs., 0.7 oz. Owner, A. J. Daugherity, Streator, Ill.

Tita Inka Wayne 44169—7 years, 6 months, 24 days, days from calving 7: Milk 369.9 lbs., butter fat 15.217 lbs., equivalent butter 17 lbs., 12 oz. Record for eleven consecutive days, days from calving 6: Milk 583.6 lbs , butter fat 23.742 lbs., equivalent butter 27 lbs., 11.2 oz. Owner, McKay Bros., Buckingham, Iowa.

Wakalona 4307—6 years, 6 months, 17 days; days from calving, 8: Milk 442.6 lbs., butter fat 15.132 lbs., equivalent butter 17 lbs., 10.5 oz. Owner Chas D. Pierce, San Francisco, Cal.

Mercedes Athenia Jewel 43465—6 years, 11 months, 12 days; days from calving 20: Milk 500.3 lbs., butter fat 15.072 lbs., equivalent butter

"ADVERTISEMENT."

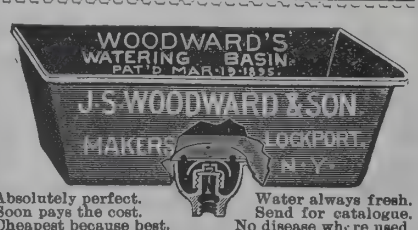
THE VALUE OF CHARCOAL

Few People Know How Useful it is in Preserving Health and Beauty.

Nearly everybody knows that charcoal is the safest and most efficient disinfectant and purifier in nature, but few realize its value when taken into the human system for the same cleansing purpose.

Charcoal is a remedy that the more you take of it the better; it is not a drug at all, but simply absorbs the gases and impurities always present in the stomach and intestines and carries them out of the system.

Charcoal sweetens the breath after smoking, drinking or after eating onions and other odorous vegetables.

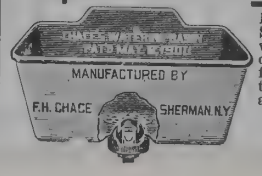


Charcoal effectually clears and improves the complexion, it whitens the teeth and further acts as a natural and eminently safe cathartic.

It absorbs the injurious gases which collect in the stomach and bowels; it disinfects the mouth and throat from the poison of catarrh.

All druggists sell charcoal in one form or another, but probably the best charcoal and the most for the money is in Stuart's Absorbent Lozenges; they are composed of the finest powdered Willow charcoal, and other harmless anti-septics in tablet form or rather in the form of large, pleasant tasting lozenges, the charcoal being mixed with honey.

The daily use of these lozenges will soon tell in a much improved condition of the general health, better complexion sweeter breath and purer blood, and the beauty of it is, that no possible harm can result from their continued use, but on the contrary, great benefit.



A Buffalo physician in speaking of the benefits of charcoal, says: "I advise Stuart's Absorbent Lozenges to all patients suffering from gas in stomach and bowels, and to clear the complexion and purify the breath, mouth and throat; I also believe the liver is greatly benefitted by the daily use of them; they cost but twenty-five cents a box at drug stores. and although in some sense a patent preparation, yet I believe I get more and better charcoal in Stuart's Absorbent Lozenges than in any of the ordinary charcoal tablets."

Absolutely perfect. Soon pays the cost. Cheapest because best.

Water always fresh. Send for catalogue. No disease where used.

Sample Basin Sent ON APPROVAL.

Basins are fitted with **Self Closing** Cover which prevents all dirt and sediment from gitting into them. Send for catalogue and price list.

Yorkville, N. Y., Dec. 18, 1903.

Starving With Plenty to Eat.

That's What Thousands With Poor Digestions Are Doing Every Day.

DON'T BE ONE OF THEM.

They have no appetite or if they do have an appetite and eat what they require it does them no good because the stomach does not digest it and the fermenting mass of food becomes a source of disease, of headaches, sleeplessness, languor and the thousand and one symptoms of disordered digestion.

Stuart's Dyspepsia Tablets promptly relieve and cure all forms of indigestion. They have done it in thousands of cases and will do it in yours. The reason is simple. They digest the food whether the stomach works or not and that is the whole secret.

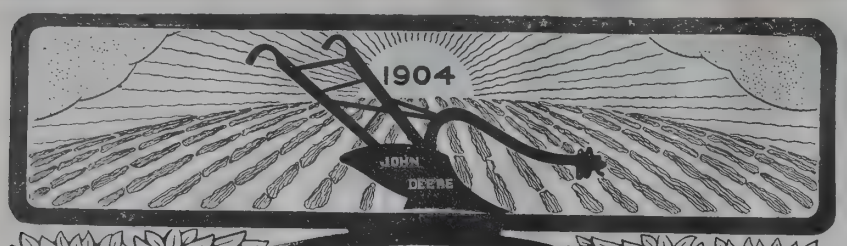
Mr. Thomas Seale, Mayfield, Cal, says: "Have used and recommended Stuart's Tablets because there is nothing like them to keep the stomach right."

Mr. E. H. Davis of Hampton, Va., says: "I doctored five years for dyspepsia, but in two months I got more benefit from Stuart's Dyspepsia Tablets than in five years of the doctor's treatment."

Mrs. E. M. Faith of Byrd's Creek, Wis., says: "I have taken all the tablets I got of you and they have done their work well in my case, for I feel like a different person altogether. I don't doubt if I had not got them I should have been at rest by this time."

Phil Brooks, Detroit, Mich., says: "Your dyspepsia cure has worked wonders in my case. I suffered for years from dyspepsia, but am now entirely cured and enjoy life as I never have before. I gladly recommend them."

Mrs. G. A. Crotsley, 538 Washington St., Hoboken, N. J., writes: "Stuart's Dyspepsia Tablets just filled the bill for children, as well as for older folks. I've had the best of luck with them. My three-year-old girl takes them as readily as candy. I have only to say 'tablets' and she runs for them."



Miss Leila Dively, 4627 Plummer St., Pittsburg, Pa., writes: "I wish everyone to know how grateful I am for Stuart's Dyspepsia Tablets. I suffered for a long time and did not know what ailed me. I lost flesh right along until one day I noticed an advertisement of these tablets and immediately bought a 50-cent box at the drug store. I am only on the second box and am gaining in flesh and color. I have at last found something that has reached my ailment."

At all druggists 50 cents a box. A little book on "Stomach Troubles" may be had free by addressing F. A. Stuart Co., Marshall, Mich.

DON'T BREAK YOUR BACK washing clothes 52 times a year. Get a "1900" washer and save labor, time and money. You need not send a cent or pay freight. It is sent absolutely free, freight prepaid on 30 days trial. A word to the wise is sufficient. Write at once to "1900" Washer Co., 9A State St., Binghamton, N. Y.

$3 a Day Sure Send us your address and we will show you how to make $3 a day absolutely sure; we furnish the work and teach you free, you work in the locality where you live. Send us your address and we will explain the business fully, remember we guarantee a clear profit of $3 for every day's work, absolutely sure. Write at once.

Comanche, I. T., Nov. 7, '03.
Deere & Co.,

Gentlemen:—Please send me two wheel boxes No. 95 for my Sulky Plow and oblige.

These repairs are for a John Deere Plow my father bought in Sherman Texas, twenty-seven years ago. It is a good plow yet, except the boxes for the wheels. It was run on black land twenty years and I have run it on sandy land seven years. Yours truly,

W. A. BOWLES.

Every John Deere Plow is Made to Wear Like That.

Standard steel plow of the world for 65 years. Made by

Deere & Co., Moline, Ill.

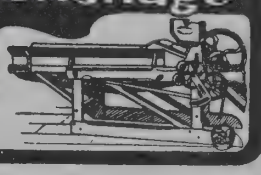
Send 25 cents for a beautiful triple gold plated souvenir and a year's subscription to our finely illustrated farm quarterly, **The Furrow.**

THE FEED FOR MILK

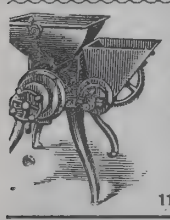
according to all authorities should be ground. It not only makes healthier stock and **larger flow**, but it is also an **economy of at least 25%.** But ground feed must be **soft and right** to be **nutritious and palatable.**
It can only be made on the

Scientific Grinding Mills.

Made in all sizes and styles, 2 h. p. up, horse power or engine. Geared, plain sweep, combined, for ear corn and all small grains. **Grinds fast, fine and easy.** Be sure to get new catalogue I.



THE FOOS MFG. CO., SPRINGFIELD, OHIO.



ALWAYS IN STOCK AT ALL IMPLEMENT CENTERS

The Best Cooker

for preparing feed for all kinds of stock is this

PURINTON'S No. 2 Steam Generator

Made of Boiler Steel and tested. Has safety valve and jointed pipe reaching a dozen barrels without unscrewing. All stock thrive better on cooked feed and **steam** cooked is the best. Never gets burned or scorched. Best boiler for scalding hogs, cleaning around dairies, etc. Quickest steamer on market. Burns any fuel and less of it than any other. Our water supply tank is a great convenience. *We will send a Cooker complete and ready to use on* **One Week's Free Trial.** Catalogue free.

Purinton Mfg. Co. Dept. E, Des Moines, Ia.

FEED COOKERS

Steam can be got up in ten minutes, and will cook a kerosene barrel of meal, or potatoes in 20 minutes. Will steam quicker with less fuel, is better built, more durable, safer, easier to operate than any other on the market. Will save one-third of feed, and make stock thrive better. To introduce, one at wholesale price where we have no agents. Prices and catalog free. R. R. HOWELL & CO., Minneapolis, Minn.

MOST HEAT—LEAST FUEL

Largest firebox. Least expense and trouble. Burns wood, cobs, straw, etc. Jacket and bottom of heavy galvanized iron (double rivited.) Two heavy cast iron plates 8 inches apart compose the double top (our patent.) This double top space connects with manhole and smoke-stack, forming dead air compartment and keeping fire below water surface which saves the heat.

We have a valuable book called "Warm the Water and Save the Feed," which we will send you FREE. It's worth $1.00.

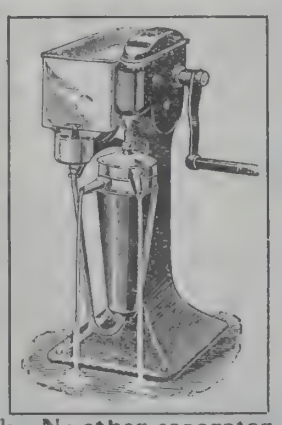
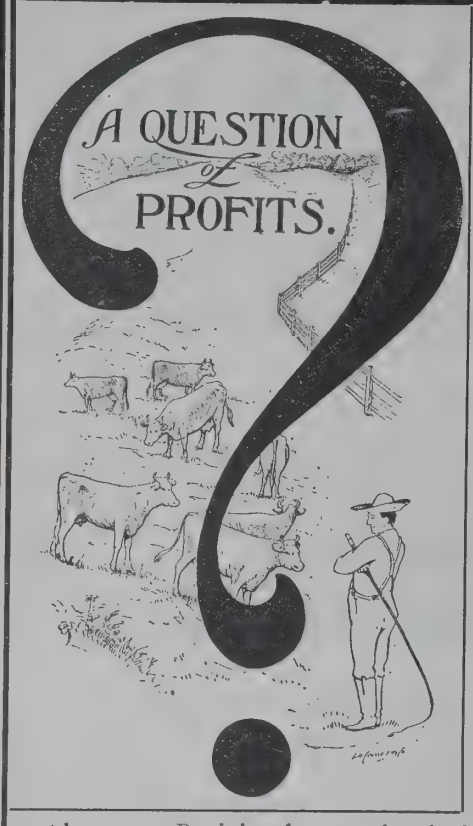
DOG POWERS BEST, CHEAPEST HARDER MFG. CO., Cobleskill, N. Y.

"Gentlemen THE TUBULAR"



Already acquainted? Then you know the tremendous advantage of **construction, operation** and **efficiency** this dairy separator possesses—how great the superiority that places it far in advance of all others—how real the immense difference existing between the Tubular and the big bowl separators, those quaint old machines with buckets full of woe.

Why Just Think



Three light pieces comprise the Tubular bowl. These are, the plain slender bowl—the small bowl bottom, which closes the bowl—and the tiny, removable dividing wall, merely a little guide to direct the milk and cream toward their outlets. It has only one bearing—the ball bearing from which it hangs. It can't bind—become unbalanced—or wabble. Could anything be simpler, more durable—easier to clean—farther ahead of the antiquated bucket bowls full of parts? **All gears are enclosed**—instantly accessible—turn in a mist of oil. Not an oil cup—oil hole—or oil tube on the machine—Isn't that very different—far ahead? **The supply can is waist low.** How many back aches—how much spilled milk will that save? **No other separator has it. The wonderfully simple bottom feed** makes the low supply can possible. It also prevents the mixing of the whole and partly separated milk. **No other separator has that. In use the Tubular requires nearly one-half less power**—will cut any other machine's clean skimming record in half—lasts twice as long—requires less oil—and seldom, if ever, needs a repair.

THAT—GENTLEMEN—IS THE TUBULAR

Free catalog No. 144 will give you full information. Write for it.

THE SHARPLES CO., CHICAGO, ILL. **P. M. SHARPLES, WEST CHESTER, PA.**

What Feed may cost, cuts but little figure. What it will net in profits is the point.

One feed may cost twice as much as another, but be way ahead of the cheaper feed, in possible profits. In fact, this is generally the case. Cheap feed is unprofitable feed. Why? Because lacking in protein, ether, organic salts and the other properties which go to form flesh, produce milk, and push young, growing stock ahead rapidly.

It is poor economy to underfeed or to use cheap feed—feed lacking in nourishment.

Much better use those feeds which have PROVED PROFITABLE by chemical test and by the practical test of feeding. Don't trust to either of these tests alone. Figures are sometimes misleading, the experience of others may not be yours. But it is safe to say that the feed which shows, both by chemical and practical test, superior feeding qualities, is the feed to buy.

ELMCO Feeds have been analyzed by the Wisconsin Experiment Station:

UNIVERSITY OF WISCONSIN AGRICULTURAL EXPERIMENT STATION.
Madison, Wis., November 6th, 1903

	Moisture	Crude Protein (flesh forming substances)	Ether Extract (fat)
ELMCO Red Dog	9.55	22.19	5.40
ELMCO Fancy White Middlings	10.08	19.38	5.43
ELMCO Standard Middlings	9.30	20.00	6.15
ELMCO Fancy Bran	10.00	16.63	4.78
ELMCO Mixed Feed	9.80	20.50	4.65

The analysis shows the feeds to be of superior quality. I have made a careful examination of the feeds and find them to be pure goods, without any foreign admixtures.
Yours truly, F. W. WOLL, Chemist.

We should be pleased to name upon request, feeders who have successfully used ELMCO Feeds. Probably we can cite you one in your immediate vicinity. Ask us. We have them scattered all over the country, among the best farmers and dairymen. We look upon our customers as our most favorable advertising; hence, our readiness to refer prospective buyers to them for information relative to ELMCO Feeds.

Besides showing chemical test and the testimony of successful Feeders, we personally guarantee every sack of ELMCO Feed to be full weight, absolutely pure and free from adulteration of any kind. Furthermore, if ELMCO Feeds do not prove as represented in every instance, full purchase price will be cheerfully refunded. Ask us for samples and prices, if you are in a position to buy in carload lots, assorted according to your wishes. Your Banker can tell you of our reliability.

CHILLS ILLS AND DOCTORS' BILLS
Painkiller
PERRY DAVIS
CURES THEM ALL

Barley Proves to be Excellent Feed for Milch Cows.

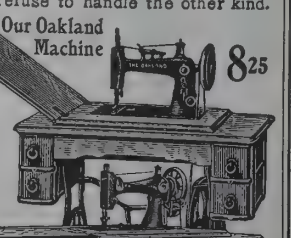
ED. HOARD'S DAIRYMAN:—I have bought 600 bushels of barley at 23½ cents per bushel (50 pounds). Thought it much cheaper than bran at $13 per ton.

We have 20 cows and heifers, some fresh and some will be soon and some from 5 to 6 months in milk. We have all the ensilage they will eat, about 30 tons clover hay. We are feeding this barley ground, in connection with ensilage, and the fresh cows are giving from 35 to 55 pounds of milk per day. It is an experience. Would it harm the cows to feed to the best milkers, say about 16 pounds of it, or would it be better to mix with bran, or molasses feed, which I can have at $26.50 per ton? The cows all like the ground barley first-rate, much better than bran alone. I have mixed with bran at first and the cows immediately increased in milk. At present, we feed ground barley alone from 6 to 15 pounds, according to size and quantity they give. Have to haul bran 9 miles, can grind the barley ourselves. The barley is not heavy, weighing 2,500 pounds to a 52-bushel wagon. We feed it also to our young heifers and yearlings.

Now, if you can make me a balanced ration with this barley, bran, or molasses feed (ensilage is first-class, clover hay is partly fair, most of it excellent), I shall feel very thankful. We sell butter at Elgin price. D. J. DEH.

Boyden, Iowa.

The results stated present a more convincing argument than we can give in words. As every reader of the DAIRYMAN knows, we have been advising the use of barley for cow feed wherever the price seemed to justify. We do not think 16 lbs. a day would injure a large, heavy producing cow, but it may be questionable whether less might not be equally profitable, letting the cow eat more silage and hay. Only daily observation and a careful daily record of the milk yield can determine this point. If the cows use very much of their feed for increase of live weight, the conclusion is inevitable that they are not being fed to greatest economy and profit. We should prefer to use some bran or the molasses feed, than depend exclusively upon the ground barley, expecting thereby to avoid cloying.



The Way it is Now.

Some wheat, of course, and also some some oats and barley; some flax and some millet; some sowed corn for feed and a lot of good field corn; some clover, timothy and red top, to top out the wild grass; some potatoes and other root crops and a big garden. A few calves and colts of high grade; a few fat steers, a few sheep and lambs; and a few fat hogs and some likely shoats; a lot of hens that lay when eggs are scarce, some fat turkeys for Christmas; a few choice high grade cows whose milk scores high in butter fat, and a good fat creamery check at the end of each month. These are some of the principal resources of the great majority of our farmers who have learned that it pays well to diversify in farming, especially out here in the west where land is cheap and easily tilled; where the soil is rich and productive, where there is a good cash market for everything raised and where each of the above can be produced at less cost in time, labor or capital, than almost anywhere else in the country. The farmers who are thus engaged are not paying out much interest money; they are not paying out much for hired help and expensive machinery, but they are "getting on in the world" and are as prosperous as a class, as any other farming community we ever saw. They and their farms are growing richer every year.—H. E. HOARD, in *Montevideo Leader*.

Backs and Hams

like those shown here are the sure result of good health, good digestion and perfect assimilation in hogs. Those desirable results are absolutely sure when

PRUSSIAN STOCK FOOD

in small quantities is fed in addition to the other ration. It saves feed, conditions stomach and bowels, wards off and cures cholera and swine plague and shortens the fattening period. J. M. Klever, the great breeder, says of it:

"I must say I am highly pleased with the Prussian Stock Food. I only fed the remedy to one bunch of pigs and they were the runtiest lot I had. They scoured and were rough in hair, skin seemed to be a dry, scurvy form, (or measles is what I call it,) and blood out of shape. The remedy in a few days showed improvement, and in a short time they were coming along all right and are now the finest pigs I have. Respectfully yours, J. M. KLEVER,
Others commend it as highly. Breeder and Shipper of Poland China Hogs, Bloomingdale, O."

Prussian Stock Food is guaranteed to give satisfaction when used according to directions. If no dealer at your place write us. Tell us how many head of stock you have and where you saw this ad and we will send you our 68 page **Farmer's and Stockman's Hand Book Free.**

Subscription in United States, Canada and Mexico $1.00 per year; 6 months 50 cents; 3 months 25 cents.

Foreign Subscriptions may be sent through Sampson Low, Marston & Co., St. Dunstan's House, Fetter Lane, London, Eng., or their agents, including the leading news dealers and book sellers in nearly all foreign countries.

All countries in the Postal Union $2.04 a year; not in the Postal Union $2.56. Included postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittances for subscriptions. The receipt of the Dairyman is sufficient notification that the money has been received. The label on the paper will show date to which subscription is paid. In case of renewals if date on lable is not changed within two weeks after remittance is sent, inform us at once.

Remit by draft on Chicago or New York, or Post Office or Express Order (never by personal check), addressing Hoard's Dairyman, Fort Atkinson, Wis.

ADVERTISING RATES.

Twenty-five cents per line, (agate measure) 14 lines per inch, each insertion.

Entered at Fort Atkinson, Wisconsin, as second-class matter.

Dairy Questions Answered by Prof. Farrington.

Too Low an Overrun.

"Will you kindly give me advice and explain about the relation of test and the overrun? I have been having a good yield, as high as 5.2 pounds per hundred of milk, but my overrun is very low. The composite samples test from 3.6 to 5.1, but there are only two or three patrons whose milk runs over 5.0 per cent fat and only three that are under 4.0 per cent. You will notice therefore that the majority of the milk received will test about 4.5. Can you give me any advice or suggestion as to how I may be able to account for my low overchurn? Would you advise me to read the tests lower than they actually show in order to help out the overchurn?" * * *

Coloma Station, Wis.

I certainly should not advise you to read your tests lower than the fat actually measures, even if you are not getting as much overrun as you think you ought to have.

Too small an overrun is caused by one of several things. First, the separator may not be skimming well, and in order to test this point I think it is a good plan to make a small hole about the size of a pin in the underside of the skim milk spout of the separator and hang a small dish under this hole. By so doing you will get a composite sample of the skim milk in your dish, as the milk will drop into the dish during the entire time the separator is skimming milk. The test of such a sample ought to show you how well the separator is skimming and I think that in many cases such a sample will give results that are somewhat surprising to butter-makers.

It is very true that a sample of skim milk taken from a separator while it is running in the best condition under full speed, and we will say in the middle of a run, may test satisfactorily, but during the starting and stopping of a separator and while it is being run, some variation in the speed and temperature may occur, or the milk supply may run short so that skimming is stopped and begun again later on. Such interruptions as this will have considerable effect on the efficiency of the skimming, and a composite sample of the skim milk will give you a good idea of how the separator has been skimming during the entire run.

After you have satisfied yourself that the low overrun is not due to inefficient skimming, the next thing to investigate is the loss of fat in the butter milk. If the churning is done at a sufficiently low temperature, so that the butter milk tests only two-tenths of one per cent fat, this is about as small a loss as you should reasonably expect from this source.

The next thing to notice is the temperature of your test bottles when the tests are read. If you are using a turbine tester and the bottles are heated to nearly the temperature of the exhaust steam, say near 200° F., the fat in the necks of the test bottles will be expanded by the heat so that if the tests are read immediately you will have an exaggerated reading and the results may be two-tenths higher than the same tests will read after you have taken the bottles out of the tester and allowed them to stand in water having a temperature of 140° F. for fifteen minutes. The graduations on the necks of the test bottles are made to measure the fat at a temperature of 120° F. If you read them at a higher temperature your test will be too high and this will be one cause of a small overrun.

I think it will be a good plan for yon to carefully notice if your work is entirely satisfactory in these three directions and if it is I am sure that you will be able to get a normal overrun.

Time of Whirling Cream Tests.

"Suppose you take two tests from the same cream, using exactly the same amount of acid in each one and then put them into a tester and in one case run the tester for two minutes and the other for five. Will the tests, in so far as the butter fat is concerned, vary, and which will show the better test and why? Suppose a third sample was taken from the same cream and the tester run for 15 to 18 minutes, will that make any difference? I am speaking in all the above cases in connection with running the machine the first time. Of course it will be understood that the samples are run about two minutes after the hot water is introduced." * * *

Winona, Minn.

We have always found that it is safe to run the centrifuge at least six minutes the first time the test bottles are whirled in the tester; this rule applies to both milk and cream.

It is natural to expect that the fat from milk tests will be separated quicker than that from cream because cream contains so much more fat than milk. I think you may safely assume that a two minute run of the cream tests in the tester will not be sufficient to separate all the fat, even though you do run it afterwards several minutes, at the second whirling. I do not see that any advantage can be obtained by trying to economize three minutes by whirling the test bottles the first time. I should prefer to be always on the safe side and whirl them at least six minutes rather than try to cut it short by whirling only two minutes.

I do not think you will get any more fat by whirling bottles in the tester fifteen minutes than you will by whirling them six minutes. If you do get more fat by whirling a longer time, the result is good evidence to indicate that the tester is not running at a sufficiently high speed to separate all the fat in the usual six minutes of whirling. I should like very much to know what advantage you expect to gain and why it is you ask such a question as the above.

We have always noticed and recommended in making cream tests that after the test is completed, the bottles should be set aside and allowed to cool so that the fat will solidify. This often aids in separating traces of water that may be contained in the fat and when the test bottle is heated a second time so that the fat is melted and it is then whirled in the centrifuge a few minutes, the fat is not only clearer than it was the first time read, but in some cases the result is a trifle different. I think it is a good plan for anyone making cream tests to try this experiment and see if the results obtained are different before and after allowing the fat to solidify.

Starters From Frozen Milk.

Will you please publish in the Dairyman the best means to follow in a creamery, where we receive about 4,000 lbs. of milk three times a week; (we do not receive any cream from hand separators). The other four days creamery is without fire. Is it better to ripen cream the day milk is received, than next day when creamery is cold, (it will freeze) and following morning warm it up to churning?

Is buttermilk from such milk of any use for a starter? Is skim milk from pure milk held by the farmer two days fof any use for a starter? And if starter is made from this skim milk and freezes the days we are not running, is it a help or detriment to quality of butter? Can better butter be made by using either this buttermiik or sklm milk starter? Or can just as good quality of butter be made by not using any starter?

Mongaup Valley, N. Y. * * * *

Under the conditions mentioned above, it certainly is a great deal better to ripen the cream the day it is received, and then hold it at a low temperature until churning than to allow the cream to ripen slowly at a low temperature for two days before churning. The ripened cream ought to be cooled down to near fifty, if it must be held 24 hours before it can be churned. I do not think it is advisable to allow the cream to freeze as it is uncertain just what will happen in frozen cream. In many cases a bitter flavor will develop, and in addition to this, freezing the cream often injures the body and grain of the butter.

The buttermilk from frozen cream will not make a good starter, neither will skim milk two days old answer the purpose of starter-making, so well as fresh skim milk. It cannot be safely stated that freezing the starter will always injure it, but it is rather a dangerous course to pursue, although in some cases a bad effect from freezing may not be noticed.

The value of a starter will depend entirely on the starter itself and the cream in which it is used. If your cream does not have any objectionable, bad odors and flavors, and you can ripen it sufficiently before churning, you will probably get just as good flavored butter without a starter as you will by using one.

If on the other hand, the milk and cream are tainted, you will be able to overcome some of the bad flavors in the butter by the use of a carefully selected starter. Using a starter does not necessarily mean that you will always get a good quality of butter. The flavor of butter is often injured by a starter, because it may convey to the cream some defects that were not present in it before the starter was added. The value of a starter depends a great deal on the expertness of the butter maker in determining whether it should be accepted or rejected on account of good or bad flavors it may contain.

It is impossible to test butter by the Babcock test because the bottles will not measure so much fat as butter contains. Normal butter ought to contain about 83.0 per cent fat, 12.86 per cent water, 1.27 per cent curd and 2.87 per cent salt. This is the average composition of over fifty samples of Wisconsin creamery butter that I collected and analyzed some five years ago, and shows that after separating the fat from butter the balance is composed of water, salt and curd.

GUEURSEYS AT PASTURE.

Paying Patrons by Test.

Will you please give method of paying patrons by the test at creamery where a test is taken twice each month? A prompt answer through your valuable paper will greatly oblige an old subscriber. Please give me a method that patrons can readily understand. * * *

Jerome, Mich.

The simplest way of paying patrons at a creamery for the milk they deliver each month is to weigh the milk of each patron every time it is delivered, take a sample of each lot of milk, add it to a jar labeled with the number of the patron, and at the end of the month add the weights of milk delivered during the time covered by the milk sheet. If the composite samples are tested twice a month, an average should be taken of the two tests and the total weight of milk delivered by each patron for the month multiplied by this average test. The result shows the pounds of butter fat delivered by each patron to the factory.

The creamery accounts ought to show how much butter has been made at the factory during the month, and also the money that was received for this butter. From the gross receipts of the creamery for the month, a certain sum must be subtracted in order to pay the running expenses of the factory during this time. What is left after deducting the expenses is the money that is to be divided among the patrons in payment for their milk. The cost of operating the factory will differ according to the agreement which has been made between the owners of the factory and the patrons. In some cases a certain number of cents per pound is charged for making the butter. In such a case all that is necessary to do is to multiply the total butter made, by the price per pound of making and subtract the sum from the total cash receipts of the factory. In other cases, simply the running expenses of the factory are subtracted from these gross receipts. These expenses usually include the cost of fuel, butter salt, packages, repairs, buttermaker's wages and other items of expense that are necessary in order to keep a factory in running order. The sum of all these items is subtracted from the total receipts for the butter and the difference is the amount to be divided among the patrons.

After the net sum to be divided among the farmers has been found, the next thing to do is to find out what price per pound of butter fat should be paid the patrons. This price per pound of fat is found by dividing the net receipts by the total butter fat delivered to the factory during the month. When this price per pound of fat is obtained, the money due each patron is found by multiplying the pounds of fat delivered by each one during the month by this price per pound of fat.

Such a method of figuring is a perfectly fair and just way of paying patrons at a creamery. It is much less complicated than attempting to add the overrun or part of the overrun to each man's check. Calculations in regard to the overrun are entirely unnecessary as the payment for butter fat as here described is simple and can be easily understood by all the patrons. If the manager of a creamery does not clearly understand what the overrun means it is much better for him not to at-

tempt to explain it to the patrons until he gets the matter clear in his mind than it is to make the matter more unsettled by a partial explanation, because if the farmers get an idea that there is another way of calculating the dividends than by the payment for butter fat alone, the subject is somewhat confused in their minds and they become suspicious that they are not receiving all that they should be paid for at the factory.

An illustration of the method of paying dividends at a factory may be of some aid in making the matter clear to the patrons. We will assume that a factory makes 6,650 pounds of butter in a month from 150,000 lbs. of milk, the average test of which is 3.8 per cent fat. We will also assume that the butter sold for $1,196 and that the factory is supposed to charge 4 cents a pound for making the butter. The dividends to be paid the patrons this month may be calculated in the following way:

First, multiply the 6,650 pounds of butter by 4 cents per pound and we get $266, which is the sum to be subtracted from the total cash receipts of the factory. In this case it was $1,197; subtracting $266 from $1,197 leaves $931 to be divided among the patrons. Second, the total weight of fat in the 150,000 lbs. milk, which tested 3.8 per cent is found by multiplying the weight of milk by its test and in this case we get 5,700 lbs. fat. The price to be paid the farmers per pound fat is now found by dividing the $931 by 5,700 lbs. fat: the result of this division gives 16⅓ cents.

The amount due each patron is now found by multiplying the total weight of his milk for the month by the average of his tests and the product obtained is then multiplied by 16⅓ cents per pound. This gives the amount of money due the patron.

By all systems of payment, no matter whether it is charging a certain number of cents per pound for making, or simply subtracting the factory's expenses from the receipts, the price to be paid each patron for butter fat is found by dividing the net cash receipts by the number of pounds of butter fat in the milk to be paid for.

If the factory wishes to pay for butter instead of butter fat, the net cash receipts for a given time may be divided by the pounds of butter sold in order to get the price per pound of butter. In our illustration we will have $931.00 ÷ 6650 lbs. butter which gives 14 1-6 cents per pound. The total weight of butter, which in this case is 6650, is now divided by the pounds of butter fat in order to find out how much butter, one pound of fat is equal to, or 6650 ÷ 5700 equals 1.16 2-3. The pounds of fat in each patron's milk are now multiplied by this figure (1.16 2-3) in order to find out how much butter the milk of each patron made. This weight of butter is then multiplied by the price per pound, which in this case is 14 1-6 cents; the result of the multiplication will show how much is due each patron for the butter made from his milk.

The dividends will be the same in either case, no matter whether the calculation is made from the price per pound of butter or for butter fat. The amount of figuring is much less complicated, and there is less of it when patrons are paid by the price per pound of butter fat, than when it is considered necessary to add the overrun and pay a certain price per pound of butter. The result will be the same, but the price per pound of butter fat will be larger than the price per pound of butter, even though the same amount of butter is paid for in each case.

Holstein-Friesians at Home.

[S. HOXIE, before the New York State Breeders' Association.]

Holstein-Friesian cattle have been produced by an environment in which the peasant farmers of North Holland and Friesland have unconsciously taken a large and very essential part. These peasants are the descendants of the ancient Friesians, of which Tacitus wrote nearly two thousand years ago, that they were peaceable cattle breeders dwelling on the shores of the North sea. How they were then protected in this peaceable occupation amid the roving, piratical tribes that surround them is unknown. They claim to have never been conquered, but admit that their ancient ancestors formed an alliance with the Roman Empire, and paid to it an annual tribute of ox hides and horns.

It is almost impossible for an American farmer to imagine the intense conservatism of these peasant farmers, especially those of Friesland, where the ancient blood is pure. Here they use the ancient Friesian dialect in conversing with one another, although educated in their very excellent common schools, exclusively in the Holland or Dutch language. They seldom intermarry with other races, and evidently cherish an abhorrence to such unions. They apparently have no ambitions beyond dwelling with and handling cattle. Doubtless they constitute the wealthiest class of peasantry in Europe, yet they refuse to be regarded other than third class people. In North Holland, where there is a considerable admixture of Celtic blood, this conservatism is not so intense, and farmers are sometimes called to high positions of state.

The conservative spirit that I have thus described, together with the soil, climate and the influence of markets, must be largely credited with producing the characteristics of this breed, to which we American breeders have given the name Holstein-Friesian.
